There is, indeed, a way in which England might contribute to the acceptance of disarmament by the Continental Powers, but it is hardly a way of which Mr. RICHARD could approve. In this respect Mr. COURTNEY is more consistent. He would have been glad, he said on Tuesday, if in 1871 the English Government had approached France and Germany and "offered to enter into "some engagement which, upon a just termination of the "war, should have bound the Powers of Europe to main-"tain that termination." Mr. COURTNEY'S meaning is perfectly clear. He regards with much reason the annexation of Alsace and Lorraine as a principal cause of the disquiet which has reigned in Europe during the last ten years, and he would have had the English Government point out to Prince BISMARCK the inevitable consequences of what he was contemplating. Prince BISMARCK might then have objected that it was all very well for England to object to the annexation of this territory; but was England prepared to give any kind of guarantee that France would not again use this territory as a base of operations against Germany? Mr. COURTNEY, as we understand him, would have been ready to give some such guarantee. At all events, he would have had the English Government move the other neutral Powers to maintain the results of the war, provided that Prince BISMARCK had been ready to bring these results within reasonable dimensions. In fact, he would have had England, and possibly Austria and Russia, give a promise to Germany that, if she allowed Alsace and Lorraine to remain French, the Powers which had given the promise would hold her harmless against any attack on the part of France. This would have been an excellent arrangement for France, and not a bad one for Germany; but what would it have been for England? Before Germany put down her armaments she would naturally have asked for some assurance that England was in a position to fulfil her promise if its fulfilment should be demanded. We should, in fact, have had to transfer a portion of the German burden to our own shoulders—to keep more men under arms ourselves in order to spare Germany the necessity of keeping so many.

There is a special objection to any remonstrances against exaggerated armaments being made by England, in the fact that she can afford to do much less in this direction than other Powers. Mr. RICHARD said nothing about naval armaments, but similar reticence could hardly be looked for from Continental Governments. They would certainly remark, in answer to any representation in favour of disarmament, that the position of England prevented her from being attacked except by sea; and that, if they enjoyed the same immunity from danger, they would be equally ready to reduce the numbers of their land forces. Possibly when the "moderation" which, according to Mr. GLADSTONE, ought to be studied in regard to our defensive establishment has been thoroughly learned, we shall be better able to give them this proof. Until, however, we have laid ourselves entirely open to attack by sea, the Continental Powers will continue to doubt the sincerity of the advice that they should lay themselves entirely open to attack by land. Fortunately the form in which the resolution was passed only binds the Government to recommend disarmament "when the circumstances admit of "it." In that case the advice will not be given for some time to come.

MODERN OXFORD.

A *LAUDATOR temporis acti*, dating his B.A. degree from the early days of our present Sovereign, would find little to distress him and much to please him should he in this year of grace renew his acquaintance with the outward aspects of University life. In the general appearance of the city, its streets, its churches, and its buildings, he would find no great changes, save that in the "Broad" ("Broad Street" we called it in our day) Balliol has put on a new and more ambitious front; and that where once were ploughed fields, glorified by the name of the Parks and now better deserving that title, beyond the fine iron gates at the back of Trinity Gardens and the front of Wadham, a new town has risen, to which Keble College, noble and imposing despite Mr. Butterfield's zigzags, and the new Museum, hideous and pretentious externally, however useful in its objects, form an appropriate introduction. New College, breaking out into Holywell, has again deserved its name. Christchurch and Merton, competing with one another in the race of ugliness, have thrown out new buildings on the side towards the meadows. Christchurch, too, if we may believe Lewis Carroll's words, and pervert William Shakspeare's, has "suffered and seen change"—change which has been the cause of much controversy and much fun. The devisers of the "Trench," the "Tunnel," and the "Tea Chest," as a huge opening in the parapet of "Tom Quad," a new double approach to the west door of the cathedral, and a wooden belfry, were irreverently called, doubtless intended them to be ornamental as well as useful, but it would scarcely seem that their intention had been successfully carried out. The unfortunate belfry has now happily disappeared, and given place to a massive tower. St. John's is further adorning the picturesque street of St. Giles with a new development of its collegiate buildings, the beauties of which are as yet known only to the architect and the Common Room.

Some of the inns of a former day have vanished. The "Angel" has fled from the High Street, and the new schools are rising in its place, where future generations of undergraduates will wait for the dreaded "Exam." with faces as white as their ties; the "Star" has disappeared from the Cornmarket; the "Mitre," as beseems episcopal Oxford, still exists, and with the "Roebuck" remains the only representation of Mr. Lowe's "Angelus aut Mitre vicina ve Stella Gazellæ." The "Randolph" and the "Clarendon" now stand first in rank, and scorn to be called inns.

If the material aspect of the streets has changed but little, the aspect of their inhabitants has changed still less. That of the townsmen has not changed at all, except where amongst them now and then appears the red coat of the soldier, once as unknown in Oxford at any time as in other Parliamentary boroughs at election time; and now and then the long cloak and broad hat of a Cowley Father, or the black dress and white hood of a Sister of Mercy. In the garb of the gownsmen a considerable change would be apparent. In our own day, indeed, the garments *nigri aut subfusci coloris* prescribed by academical law were more honoured by their mention in the statute book than by the rigid enforcement of their wear in real life; but now our visitor would see much of strange head-gear which his generation

knew not, much of pea-jackets and other coats of curious cut and colour which in that more reverent time were only permissible to the undergraduate on his way to and from the boats. He would see little, at least in the daytime, of the academical cap and gown; and such gowns as did meet his eye, other than those of dignified graduates, would be short as Mawworm's spencer, shorter than the Norman cloaks which moved the Franklin Cedric's ire, all too short to deserve the name, more graphic than elegant, which distinguished the flowing robe that he himself was wont to wear in his undergraduate days. But *cucullus non facit monachum;* the undergraduate of forty years since was much like the undergraduate of to-day, his interests the same, his talk the same. His ideas in the matter of examinations were limited to Little-Go and Great-Go, while those of the present generation have developed themselves further, and their talk is of Smalls ("Responsions" καλέουσι θεοί), "Mods," and "Greats," with a forest of offshoots from the latter stem, in the shape of "Second Schools," called by the euphonious names of "Bones and Bottles" (natural science), "Stinks" (chemistry), and many others, direful cause of "ploughing" ("plucking" we, with more historic accuracy, were wont to call it) to undergraduates unnumbered, who, however, seem to like the painful process better than their fathers did, or at least affect to treat the catastrophe more lightly. Less wine is drunk than in those days, when the traditions of former and more bibulous generations had not wholly died out; and the greater facilities for dealing with London free the hands both of buyers and sellers, so that the latter have less inclination to sell and the former have no inclination to buy the pernicious stuff which was in vogue in Oxford in our day, and which we fondly thought was port. Fewer oaths are sworn, and Bob Acres, should he enter himself at either University, would happily find a full confirmation of the truth of his famous apophthegm.

The cries of "Town" and "Gown" have not wholly ceased to resound in the streets of Oxford; but the manners of the present generation differ in this respect nearly as much from those of forty years since as the manners of that day did from those of the time of Edward III., when, on the Feast of St. Scholastica the Virgin, in the twenty-seventh year of his reign, townsmen and gownsmen fought out their quarrels "with bows and arrows and divers sorts of weapons." Rarely now does

. . . turri reading-man altâ
Startulat horrid uproar . . .

as when Guy Fawkes Day in each year was judged the properest day for a row, without prejudice to the right of any other day in Term-time to its share of cracked crowns and black eyes. Nowadays such evil deeds are, we believe, rarely heard of.

But one of the greatest changes of all those which would show themselves to the wondering mind of the visitor would be that which has taken place in the relation between undergraduate and tutor—a change almost entirely for good. There was indeed some merit in the awe with which we of the thirties looked upon our tutors—gods moving in a sphere wholly different from our own—epicurean gods, we sometimes ventured to think them, caring little for the joys and sorrows or the words and works of men below, holding little communication with their pupils save where the awful lecture-room recalled too vividly the form at Eton, Harrow, or elsewhere, from which we had not long before been emancipated, or where the stiff breakfast, to which once a term a favoured few were invited, had for half an hour brought about a semblance of familiar intercourse between don and undergraduate—a stern rebuke for too frequent knocking in, or for too infrequent attendance at morning chapel, a few laudatory or objurgatory words at "Collections," and the term ended without the creation of cordial or intimate relations between tutor and pupil. We speak, of course, in generals; but there were, no doubt, many fortunate exceptions. At the present time those exceptions have apparently become the rule. The awe has in large measure departed, and the respect, we fear, on the whole diminished. The tutor—even the Head of the college—is no longer in the eyes of the undergraduates an exalted personage whose invitation is a command, and "sorry to say I'm engaged" is now deemed quite a sufficient answer in declining to be present at entertainments in high places suspected of being dull or slow. On the other hand, a greater equality of status being thus assumed, the result is that the tutor is more in harmony with his pupil than was the case in times past. The elder tutors seem to have more than their predecessors had the desire to exert a personal influence on the younger members of their college—an influence which may or may not be in all respects good, but which is at least friendly, active, and intelligent. The younger tutors exercise their influence also, but naturally in a more companion-like way. They walk with the men, row with the men, chat familiarly with the men, and are to be seen in friendly converse in their rooms.

Other changes there are in Oxford, brought about of late years by the direct action of the Legislature—changes which have modified and are modifying in very important points the relations between the students and the authorities of the University both within and without the walls of the colleges, and that to an extent scarcely contemplated by the Legislature itself. These changes have sprung in part from the craze for experimental legislation in general which besets some of the politicians of the present day. They select the Universities for the *corpus vile* of their experiments, and seem to desire to try how Oxford will get on without a distinctive religion, and how Oxford Fellows will get on with wives; and the great feature of the new political law is that theory is at no time to be corrected by practice, and that a statesman should scorn to learn wisdom from the result of his experiments. If they signally fail, so much the worse for the *corpus vile*. Is the dose poison? Never mind, he must continue administering it even though the patient dies; and when new patients come he must give yet stronger doses. Let no one speak of discontinuing the treatment. "We must never go back!" This seems to be the one tenet which an earnest member of the "party of progress" is bound to hold, *coûte que coûte*. It is the *articulus stantis aut cadentis ecclesiæ* for the devotees of a Liberal creed. No matter before what false gods they have unwittingly bowed down, no matter what false steps they may have taken, no matter into what slippery places they may have been blindly led, they cannot go back; to hold that a backward step may be taken, even from the edge of a precipice to safe standing-ground, is a dangerous heresy; an admission that the Liberal party may have shared the lot of human beings, and fallen into error, is treason to the cause. If the Ballot, whatever benefits it may bring with it, is shown to be an instrument of demoralization, and the fruitful parent of a huge family of lies, the thorough-going Liberal, who admits the fact, regrets the result, but "cannot consent to a backward step." If the extension of the franchise has falsified the hopes alike of the Liberal party who clamoured for it, and of the Conservative party who carried it; if it has thrown the management of the affairs of the country into the hands of a class of voters as impulsive as it is ignorant, of voters who have given us for the last six years (so say the Liberals) "the most corrupt, subservient, and immoral Parliament that has existed since the days of King Charles"; if it commits the control of the national funds to electors who contribute little or nothing towards them, still, we are told, and perhaps from the nature of the case told truly, that here also there is no retreat; that the only remedy is to go further, even though we fare worse—to let in more ignorance and more pauperism, in the feeble hope that it may serve as a counterpoise to the mass now admitted to the suffrage, but with every probability that it will be indeed an additional weight round the neck of steady statesmanship. The country will have less chance of being well governed; but what signifies that? *Fiat æqualitas, ruat Anglia!* We must move onward though we move to misfortune! And so, too, if a University without a distinctive religion bids fair to become a University without any religion at all, if wedded life for the Fellows of Colleges bids fair to be the destruction of collegiate life, no Liberal statesman is truly liberal enough to consent to revise the action of his party, and acknowledge and remedy such defects as may be found.

It is perhaps worth while to inquire for a moment into the causes which led our modern reformers to make this experiment on the Universities. All restrictions, all laws, are an interference with individual liberty, and as such are in their eyes an evil; the more zealous of them still look with longing to the day when some theoretic "France shall reign and laws be all repealed." One especial restriction had long grieved their souls—the enforced celibacy, as it was called, *ad invidiam*, of Fellows of Colleges—that is to say, the rule which vacated a Fellowship a year after its holder had contracted matrimony. It was a relic, said they, of monkish superstition; it was an interference with the natural liberty of man, who, by the possession of one Fellowship, would be at once tempted to look for another and tenderer fellowship. Why should he not live and love in Oxford or Cambridge, and as the parent of future Fellows (of both sexes) help to people the new town that has grown up beyond the Parks or the pleasant suburbs on the banks of the Cam? Well, the experiment was perhaps worth trying, and to minds penetrated with stories of the stiffness, the prejudice, and the littleness of the life of a college Don—minds that probably had little personal experience of that life, or of the true character of its duties—it could not but offer the promise of great advantages for the coming generations, at least of teachers, if not of the taught; but we are inclined to think that the supposed advantages have melted away like the mirage, beautiful and tempting in the distance, but vain and empty when approached.

The Fellows of a college in old days, such of them at least as were resident in the University, were dwellers within the walls of their college, and lived in some degree a common life, having a joint and collective weight in the councils of the University, and being responsible both as tutors of the undergraduates and as governors of the college for its internal discipline. As time went on, marriage, promotion, and death divided between them the task of making vacancies in the ranks, promotion and marriage frequently joining their forces for the purpose; succession was fairly rapid, and each group of Fellows, enlivened from time to time by the infusion of new blood, was in small danger of vegetating in conventual dulness; while the emoluments of the college, changing hands more rapidly, did double or treble duty, and served to give a start in life to a larger number of men. But now the case is altered; no Fellow has ever to weigh the relative charms of the Muses and the Graces, ever to stand—like Garrick between Comedy and Tragedy—drawn this way and that by Plutus and Hymen. He can combine the delights of both, and marry in haste without having to repent at leisure the loss of his Fellowship. He can do more; he can still live under the invocation of Minerva, still dwell in Oxford, enjoy a tutorship in his college, and employ the time not absolutely given to lectures in attending to his own children and to the private pupils whose payments help to provide for them. A vice-principal of a college lamented in our hearing that his college, as a college, had ceased

to exist, that its collegiate life was a thing of the past; all the other Fellows had incurred the misfortune imprecated by Lord Rochester on the dog that bit him—that is to say, they had "married and lived in the country," and he himself, though he had no apprehension of falling into matrimony, yet was building a house, and expected to have to undergo the latter half of the noble Lord's malediction.

Under these circumstances it is no wonder if the friendly and beneficent intercourse between tutor and undergraduate, of which we have spoken above, should have decreased and should continue to decrease.

HEALTH AT HOME.

HAVING got over the emotion caused by the strange bequest of that humorous testator, Sir Walter Trevelyan, and having doubtless discovered how to utilize centenarian wines for the advancement of science, Dr. Richardson is able to proceed equably with his task of instructing men how to live long. For some little time past he has been publishing in *Good Words* articles on "Health at Home," and in the number for the present month he concludes the first part of his subject, bringing to an end a discourse of considerable length respecting bedrooms; and, as he considers the proper arrangement of these to be a matter of paramount importance with regard to health, it may be well to examine what he has to say about them, while awaiting a disquisition on sitting-rooms and kitchens, which is not likely to be short or soon completed. As he pathetically observes, people spend a third of their lives in bed, and the question of how best to obtain healthy conditions in a room wherein so large a proportion of existence is passed is certainly of sufficient importance to merit consideration by itself.

Few of those who are acquainted with Dr. Richardson's sanitary sermons can begin the study of a new one without a certain feeling of fear, and on this occasion it will undoubtedly be found that fear is well justified. The reader will not, it is true, learn in harrowing detail all the harm he is doing to himself by what he fondly imagines to be a harmless practice; but he will certainly discover, unless he has devoted extraordinary attention to the arrangement of his house, that he is living under conditions which ought to produce ill-health, and must inevitably shorten life and make existence less enjoyable than it should be. Probably, indeed, after the first thrill of alarm is over, the reader will be surprised at the fact that he is not a hopeless invalid, when he considers all the essential matters enumerated by Dr. Richardson, to which, from carelessness or ignorance, he has not given attention. Very numerous and very formidable are the conditions necessary to obtain healthy rooms, as stated by the learned writer. At the risk of startling many who, reckless of the laws of health, are living in a state of sanitary depravity which it is painful to contemplate, we will endeavour to give a short account of his ordinances. First of all, before dealing with bedrooms, the Doctor points out that the living neglect too much what Goethe craved for when dying, and that there is urgent need for more light. "The mind is saddened," he says, "in a home that is not flushed with light, and when the mind is saddened the whole physical powers soon suffer; the heart beats languidly, the blood flows slowly, the breathing is imperfect, the oxidation of the blood is reduced, and the conditions are laid for the development of many wearisome and unnecessary constitutional failures and sufferings." Not content with thus stating emphatically the necessity for light, he says further on:—"I once found by experiment that certain organic poisons, analogous to the poisons which propagate these [epidemic and contagious] diseases, are rendered innocuous by exposure to light. Thus, in every point of view, light stands forward as the agent of health. In sickness and in health, in infancy, youth, middle age, old age, in all seasons, for the benefit of the mind and for the welfare of the body, sunlight is a bearer and sustainer of health." Now undoubtedly there is a good deal of truth in this, though, after the fashion of sanitary writers, Dr. Richardson somewhat exaggerates. A great many Londoners who have to live in comparatively dark places manage to maintain tolerably good health, and do not find that their constitutions are steadily lowered, or that they constantly suffer from the action of hideous poisons. Some of the effects which he ascribes to want of light are probably due to defective ventilation, but still it is impossible to doubt that there is a basis of truth for what he says, though he says it in an over-emphatic manner, and that plenty of light should be admitted into a house. Is he not, however, in his energetic appeal, rather like the adviser who strongly recommends a man always to have a good balance at his banker's? With the exception of a few æsthetic enthusiasts, are not most people—in London at all events—glad of as much light as they can get? Unfortunately streets cannot be widened, and all rooms cannot have a southern aspect. Moreover windows must not be of more than a certain size, or else the house will be unbearably cold in winter. This fact, of course, has to be taken into account; but scarcely any one can look at the face of a row of modern houses in South Kensington or elsewhere, and say that too much attention is paid to it. Londoners certainly do not seem now to disregard the advantages of light. Unfortunately, do what they will, they can get all too little of it; but there is small use in repining over this deprivation, which is likely to continue unless the new Government can bring about the promised change in the climate, and at the same time reconstruct the metropolis.

After thus dealing with the question of light, and before treating bedrooms, Dr. Richardson has something to say about sleep, and gives some broad general advice, the full bearing of which he perhaps hardly appreciates. He first indulges in that denunciation of late hours which always gives such pleasure to writers on sanitary questions, and then says:—"I have said before, *make the sun your fellow-workman.*" (The italics are Dr. Richardson's.) "I repeat the saying now. I do not say, go to bed at all seasons with the sun and rise with it, because in this climate that would not be, at all seasons, possible; but I say, as a general principle, as closely as you can, make the sun your fellow-workman; follow him, as soon as you are able, to rest, and do not let him stare at you in bed many hours after he has commenced his daily course." Now this no doubt sounds very pretty, and the Doctor seems naturally pleased with the expression which he repeats; but let us see what any attempt to follow his advice would involve. In spring and summer it would not perhaps be so very difficult to obey him. On the 1st May the sun rose at 4.33 and set at 7.21. On the 1st of this month it rose at 3.50 and set at 8.5. On the 1st of next month it will rise at 3.49 and set at 8.18. During these months, then, a man of some determination, who utterly gave up society, would be able to take his time from the sun, though he would have to change his hours in a very inconvenient fashion. But how will he manage when autumn and winter come? Then indeed the changes will be great, and the course of the sanitary worshipper's life a most remarkable one. On October 1st the sun will rise at 6.2, and set at 5.36. On November 1st it will rise at 6.56, and set at 4.31. On December 1st it will rise at 7.47, and set at 3.52. During October, then, the true believer should rise at six and go to bed at seven at the latest; during November he should rise at seven and go to bed at six; and during December he should rise at eight and go to bed at a quarter-past five. Luckily for mankind, Dr. Richardson cannot be in the habit of practising what he preaches, or he could not have done half the valuable work he has accomplished. If he ever does try to obey in this country his own precept, and to make the sun his fellow-workman, he will discover that he has a fellow-workman who is usually on strike.

Going on to bedrooms after these initiatory remarks, Dr. Richardson has, as might be expected, much to say that is worth attention, though it is not easy to agree to all his *dicta*. He states first of all, that the bedroom is "really the most important room in the house by far and far again," and, though the assertion may seem startling, there probably are, from a sanitary point of view, good grounds for it. He then goes on to complain, with some exaggeration, of the carelessness which prevails with respect to bedrooms, stigmatizing with just wrath the practice of using them half as lumber-rooms, and says imperatively that every bedroom should, "by preference, have its window on the southern side of the house, the south-eastern or south-western." Undoubtedly; and undoubtedly every man who drinks claret will do well to stick to old Château Margaux. Unfortunately many men cannot afford to do so, and unfortunately the majority of houses have two sides. If in a town house some bedrooms look to the south, others must look to the north, and get no sun at all. Save at an enormous sacrifice of valuable space, it is impossible to construct a town house so as to give every bedroom a southern aspect, and a writer of Dr. Richardson's ability should not gravely lay down general rules which, so far as regards cities, are simply unmeaning. In the country, no doubt, the case is different; but to build a country house with all the bedroom windows facing towards the south would involve large expenditure, and is for other reasons undesirable. Dr. Richardson's dogma is, indeed, a remarkable instance of the manner in which sanitary writers get carried away by their subject, and forget all the conditions by which ordinary men are bound. On other matters he is happily more practical, and he gives advice, some of which is new, and all of which is worth attention. Very formidable are his rules, and few, indeed, can be the houses in which attention is now paid to any of them. He first points out, as many have done before, how ventilation is neglected in most bedrooms; describes, with unction, what this neglect means; and shows how a proper supply of air may be obtained by Tobin tubes leading from the outer wall, or by a "four-inch wooden tube through the whole length of a partition from the top to the bottom floor of the house," supplying air to each room. He also speaks of a plan of exit ventilation, invented by the late Dr. Chowne; and, with due regard for old people, who are so often killed by cold at night, tells how, by a certain stove called the Calorigen, a stream of fresh warm air can be caused constantly to flow into a room. There are, no doubt, some considerable objections to heated air, as those who live in rooms warmed by pipes are well aware; but probably they are not so great as to counterbalance the enormous advantages of warmth at night, at all events for the aged. Dr. Richardson says nothing about them, and he is also silent respecting an objection which is sometimes made to the admission of a large quantity of air into bedrooms at nights. It is said that in cities the emanations from the drains rise during the night, and that, if the air carries them into bedrooms, they may do much harm. The idea may be a pure superstition, but it is very generally held, and it would be interesting to know what so competent an authority as Dr. Richardson has to say respecting it.

After dealing with ventilating pipes and stoves for bedrooms, he proceeds to consider how the floors and walls should be treated, and, with the boldness of a scientific enthusiast, he immediately makes a suggestion which it is to be feared will bring upon him the furious hostility of every good housewife who reads his article.

Bedroom floors, he says, should not be scrubbed. The honest soap-and-water in which old-fashioned matrons and their servants put their trust are to be discarded. "Water," says the Doctor, "destroys the evenness of surface; water makes the adoption of the waxed floor almost impossible; water when it is used often percolates into the joints of the floor-boards, causing them to separate and become holders of dirt; and, lastly, if water be used for cleansing, the chances are many in the course of a year that the room will be left damp and chilly." The proper course to pursue, it seems, is to prepare the floor by varnishing simply, or by staining and varnishing, or by paint and varnish, and afterwards to keep it clean by dry-rubbing and by beeswax and turpentine. There is nothing really so clean, he says, and nothing so healthy. Doubtless he is perfectly right, but the innovation which he suggests will certainly not at first commend itself to the female mind; and, with regard to bedroom floors, mistresses of houses are supreme. It must be remembered, too, that floors treated with beeswax and turpentine have a somewhat unpleasant smell, and are apt to be sticky unless well polished, and that polishing them is a very laborious process. It is much to be feared that Dr. Richardson's words, like those of other prophets, will remain unheeded, and that floors will still be scrubbed and wholly covered with carpets. Possibly, however, what he says about the walls of bedrooms may command more attention, and his sanitary ordinances with regard to them may be more willingly obeyed. He very strongly objects to papering walls, on account of the enormous amount of dirt which is absorbed by paper at one time and let loose by it at another, and further objects to the abominable, but unhappily general, practice of putting layer upon layer of paper on walls. If they must be papered, he seems to think that the best plan for treating them is that adopted by a friend of his, who coats his paper with coachmaker's varnish till the surface is as hard as the panel of a carriage. There is small hold for dirt on such a surface, and it can be washed without the smallest difficulty. Much the best plan of all, however, according to the Doctor, is to have no paper at all. Those who are building new houses, or those who can to some extent disregard expense, should cover the walls with some impermeable cement, like Parian. If this is considered too costly, the plaster of the rooms should be painted with lead or silicate paint, or coloured with distemper. The paint may be washed, the distemper renewed. Neither of them absorb, as paper does, particles of all kinds, some of which can hardly fail to be prejudicial to health.

Dr. Richardson's main suggestions are, then—That bedrooms should be well ventilated, in a manner which he describes; that there should be means for keeping up a steady heat in them in winter; that the floors should be carefully polished, and not cleaned with water; that the walls should be painted or distempered, not papered; and that, if possible, an impermeable cement should be used for them. The adoption of these rules would involve a formidable amount of trouble and expense, and none of them are at present generally obeyed. It can hardly be disputed, however, that they ought to be to some extent obeyed, and that Dr. Richardson is, in the main, right. Those who wish to sleep in healthy rooms should certainly consult his pages. In some respects he appears to be fanciful, in others Utopian; and he too often neglects the fact that most people have perforce to live in very indifferent houses, and that few can construct mansions according to the rules laid down by scientific men. These, however, are comparatively small defects in what are undoubtedly very valuable articles; and, even though it may not be practicable or advisable to follow absolutely all Dr. Richardson's rules, there can be no doubt that his exhortations and sanitary decrees may be studied with great advantage.

MONDAY NIGHT'S ROW.

It will be remembered by all persons of passably good memories that in the various "scenes" which have occurred in the House of Commons since the Session of 1877 the admirers of the present Government found not the least strong of their arguments in favour of a return of the Liberal party to power. "Oh! for one hour of Mr. Gladstone," they used to sigh pathetically when obstruction proved too much for Sir Stafford Northcote. The House of Commons had several hours of Mr. Gladstone under the proposed circumstances on Monday night last, and we are bound to observe that here again a slight disappointment seems to have been experienced, even by the most ardent admirers of that statesman. The occurrence indeed appears to have annoyed these persons a good deal; and they are very angry with Mr. O'Donnell who caused it, and with the wicked men who abetted him. This is quite natural; and the disappointment is natural too. For Mr. Gladstone *afflavit* with great vigour, and yet it could not be said of his adversaries *dissipati sunt*. Now it is a rule with all prudent divinities not to allow themselves to be betrayed into an afflatus of the kind unless the consequent dissipation of the enemy is certain. Otherwise doubts arise, even in the mind of fervent devotees, as in this case they seem to have arisen. Indeed the conduct of Her Majesty's advisers on this particular occasion was characterized by a double portion of that ill luck which has thus far constantly attended them; and it is to be feared that revilings addressed to Mr. O'Donnell and the wicked Tories will hardly suffice to divert the general mind from the conclusion that yet once more they have made a considerable mess of it.

We need not trouble ourselves with any inquiry into the merits of Mr. O'Donnell's conduct in reference to the impending French Ambassador. It may be that it is well that as little as possible should be said, under any circumstances, about foreign ambassadors in the House of Commons, though Mr. O'Donnell's retort about Chevket Pasha as a possible Turkish Minister must have been a hard hit to some of his hearers. But, on the whole, the worthiness of an ambassador in these days is a matter rather for the Government to whom he is accredited to consider than for the people of the country. If Mr. Gladstone and his colleagues think the gentleman whom the French Republic sends them good enough for their society, it is not very much the business of anybody else. But what seem to have been overlooked in the very numerous comments which have hitherto been made on the affair is that Sir Charles Dilke really brought all the trouble on his superiors' heads by being a great deal too clever. The present Government has already established its claim to be one of the most evasive ever known, and Sir Charles must needs show that he could dodge and double as well as his chiefs. So, instead of answering Mr. O'Donnell's question, he answered a totally different one. Mr. O'Donnell had asked whether a certain person was the person who was said to have given a certain order, and the answer was that the order was never put in execution. Mr. O'Donnell had asked whether the same person had or had not undergone a certain legal censure, and the answer was that the censure had been inflicted under certain peculiar circumstances. Now Sir Charles Dilke by this ill-timed display of astuteness, and by his over-hasty eagerness to defend M. Challemel-Lacour, gave Mr. O'Donnell a ground of complaint, which, if not a very serious one, was undoubtedly legitimate in form; and thereupon ensued a disturbance in which Mr. Gladstone, Sir William Harcourt, and even Lord Hartington seemed to vie with each other as to who should say and do the most unwise thing. The Speaker had promptly interfered to point out the inconvenience of Mr. O'Donnell's adopting the plan of moving the adjournment of the House for the purpose of intimating his dissatisfaction with Sir Charles Dilke's evasion. And there can be no doubt that the proceeding is an abuse. But Mr. Gladstone, not content with the Speaker's interference, himself interfered to support the Speaker, and supported him with a vengeance, by moving that Mr. O'Donnell "be not heard." This was certainly taking the bull by the horns; but a bull, especially an Irish bull, should not be taken by the horns unless the taker is quite certain that he can throw him. One after another of the Irish members rose and protested impartially against the conduct of Mr. O'Donnell and the conduct of Mr. Gladstone. The latter then tried to lay down the principle that the practice complained of was not merely an abuse, but a breach, of the rules of the House. This attempt, however, which certainly did not lack boldness, received no support from the Speaker, and was completely upset by Mr. Sclater-Booth. And the matter was not much helped by Mr. Cowen's eulogies of M. Challemel-Lacour. It seems a little unfortunate that Sir Charles Dilke and Mr. Cowen, and some other persons of very well-known political principles, should not perceive that their own admiration of an extreme Republican is not decisive of his merits, and still less decisive of the construction to be placed on the rules of the House of Commons. What with this irrelevance, and with the grave question which the Prime Minister had sprung upon the House, Sir Stafford Northcote was certainly justified in remarking that the situation was "inconvenient." This remark was followed by a reminiscence painfully "inconvenient" in another sense of certain antecedents of the members of the present Government in respect to questions and motions for adjournment. Thereupon a third member of the Ministry proceeded to demonstrate his incapacity to comprehend or manage the situation. Sir William Harcourt made a most extraordinary assault upon Sir Stafford Northcote for giving Mr. O'Donnell support, and a scene of what is technically known to historians and reporters as "the wildest uproar" followed, in the midst of which Captain Price made an ingenious *reductio ad absurdum* of Mr. Gladstone's proposal by moving that the Home Secretary "be not heard." Sir William Harcourt, however, got himself heard, and, like his predecessors, tried to make out that the question still under discussion was the worth or unworthiness of M. Challemel-Lacour. After this the proceedings might be described as confused speaking diversified by a few divisions, and ending in a virtual surrender to Mr. O'Donnell. In the course of the debate Mr. Gladstone described Sir Stafford Northcote's account of his speech as "garbled," and surpassed himself in denying that he had called Mr. O'Donnell to order, while he had to admit that he had risen to order, moving that Mr. O'Donnell be not heard. Even Mr. Forster, who generally manages to keep his temper, lost it, and had to "withdraw"; while Lord Hartington, like every one else on his side, persisted in treating the matter as if M. Challemel-Lacour were still the subject of discussion.

This squabble, if not so discreditable to the House at large as some others, cannot be said to have been creditable to the Government. It will be observed that five of its prominent members divided among themselves certain pleasing and edifying parts, of which some of them played more than one. Sir Charles Dilke undertook the character of the Artful Dodger, and succeeded so admirably as to keep his chiefs and the House in the hottest of hot water for the whole evening. Sir William Harcourt, who seems to have relapsed from the state of grace into which his special providence for a time introduced him, undertook the favourite part of the conciliator who puts out fire with oil, and succeeded in it to a wonder, though he may be said to have

been run hard in this respect by the Chief Secretary for Ireland. Both these gentlemen, by the way, displayed a singular obtuseness which matched their equally singular heat. To perorate about friendly countries and absent men, when the question in reality under discussion is the advisableness of giving the leader of the House of Commons for the time being *carte blanche* to shut the mouth of any member who is obnoxious, seems to be a little fatuous. Lord Hartington, as usual, showed the difference of his temperament in the tone of his remarks; but even upon him a remarkable blindness to the real question seems to have come. It is exceedingly seldom that Lord Hartington indulges in a sophism, but the more intimate companionship in which he must lately have been thrown with Mr. Gladstone seems to have had the usual effect of evil communications. Lord Hartington implored the House to remember that, "if they voted for Mr. Gladstone's proposition, they were voting for the discontinuance of the attacks on M. Challemel-Lacour." As a matter of fact, it need hardly be said that they were voting for nothing of the kind; but, on the contrary, were placing in the hands of the most irritable and self-willed of modern statesmen a whip to be used on their own backs at his will and pleasure. As for Mr. Gladstone himself, it may truly be said that he played not one part, but half a dozen. There was the "happy thought" part, in carrying out which he moved that Mr. O'Donnell "be not heard"; the part of the skilful casuist, in which he contended that to "rise to order" when a member is speaking is not to call that speaker to order; the part of injudicious friend, in virtue of which, in supporting the Chair, he argued that a practice which is undoubtedly lax and inconvenient was in contravention of the rules of the House. Nor is even this list exhaustive. A distinct character may be said to have been assumed in the effort to convict Sir Stafford Northcote of "garbling" by alleging that he, the speaker, had not "justified" a thing, but had only "excused" it, and by ignoring the fact that Sir Charles Dilke's original answer was itself not an answer at all, but an argument. No one will deny the versatility of these appearances, though there may perhaps be two opinions as to their merits. In particular, the astonishing heat developed by members of the Government in the discussion does not augur well for the future. The excitement shown in so small a matter as this (for it must be remembered that, if Sir Charles Dilke had given a simple, straightforward answer to Mr. O'Donnell's question, and had left the latter to do or say his worst, nothing could possibly have happened), is at first sight unintelligible. In the Under-Secretary for Foreign Affairs and in the senior member for Newcastle personal partisanship may, as we have said, explain the attitude taken. But why Mr. Gladstone, or Lord Hartington, or Sir William Harcourt, or Mr. Forster, should excite themselves in this extraordinary way over such a person as Mr. O'Donnell baffles comprehension. All public men in France have ugly charges brought against them, and the Republicans, with the opportunities they had in 1870, and the example of the Convention and the Directory behind them, were perhaps likely to deserve, and certainly likely to meet with, a rather unusual amount of obloquy. It is childish to pretend that M. Challemel-Lacour's name has not for a whole decade been to every one conversant with French affairs that of a clever man against whom there were charges, true or false. Her Majesty's Ministers by accepting him as an Envoy have sufficiently signified their disbelief in or their indifference to these charges, and that they should make him an occasion of exhibiting their own want of tact, temper, and intelligence in this surprising way is a mystery only to be explained on the general theory of their persistent and inveterate ill luck.

STREET NUISANCES.

THE short interval between the elections and the assembling of Parliament for business was enlivened by a newspaper correspondence on street nuisances. It did not lead to much, although it brought out once more very distinctly the anomalies of parochial government in London. The many advantages of town life are, it seems, more than counterbalanced, in some people's opinion, by the martyrdom of the senses through sights, smells, tastes, noises, and crowding. We have a tolerably healthy place to live in. We have a good deal of wood pavement and very little dust. Medical science is lessening our pains. Our museums and libraries are being daily made more and more accessible. Locomotion is cheap. Property and life are fairly protected, and policemen are occasionally to be had when they are wanted. Yet we are not happy. The sense of smell appears to have been chiefly attacked during the Whitsuntide holidays. A gentleman who chose to stand over an opened grating was sickened by the odour from below. The obvious remedy would have been to remove his standpoint, but he wrote to the *Times*. He really seems to have had a very small grievance, if any. Very much more serious was the complaint of another writer. After the long spell of dry weather the streets when watered gave forth a horrid smell—we are not sure that one correspondent did not characterize it as a stink. We may skip the nauseous details which followed in series of letters, only pausing to note that the secretary of a Northern vestry pointed out with much satisfaction that in his parish a deodorizing substance—a salt of some kind—is mixed with the water in the carts, and the streets corned or pickled with it so as to spare the noses of passengers. It is to be hoped that the good example thus set may be generally followed. Such a Vestry is as the salt of the earth among its fellows. It must be allowed that some of the principal streets did smell very unpleasantly during the dry weather. But dry weather is so rare and so welcome of late years that, on the whole, many of us would be very willing to have a little more of it, even at the price of an extra "stink" or two. Still the suggestion of the St. Pancras official is so good that, unless we see it universally adopted, we may have a reasonable cause of grumbling. It is not granted to every man to perambulate the streets adorned with a *pince-nez*; and the odour of Piccadilly and Pall Mall on one or two days a fortnight ago can hardly have been wholesome, and was certainly disagreeable. It will be wise, however, not to expect too much from the Vestries. Year after year, season after season, it has been pointed out to these astute bodies that the months of May and June are not those in which the West-End streets and squares are most empty. Yet this very month there is hardly a West-End thoroughfare some part of which is not invaded by a steam roller which will be idle through the autumn.

But it is rather within our houses than without them that street nuisances attack us. It is some years since we called attention to the state of the law which allows our neighbours to keep noisy pets, to encourage organ-grinders, and to make themselves generally unpleasant and, in case of illness, dangerous. Nothing has yet been done to remedy this state of things. Party walls are thinner than ever, while our nerves are not strengthening in proportion. There have been times in the history of the world when a man's enemies have been those of his own household. Now, in too many instances, they are those of the household next door, especially those who practise the piano. Some people purposely take old-fashioned houses in unfashionable districts, because, as they say, old houses are better built. This is not strictly true; but when a house has survived, say a hundred years, it is presumably one which was originally erected with some view to permanence. The weaker houses have perished; but no one who has attempted to fight the battle of existence in an old wooden house such as we often meet with in country towns will allow that even a suburban villa is worse. Of course in our artificial civilization we are mutually dependent on the forbearance of each other. Life would be intolerable in a city governed, or not governed, like London, if personal freedom were not tempered by a regard for the feelings of others. Yet this regard does not largely prevail. One might go a day's journey without finding anybody who would acknowledge to a liking for barrel-organs. Yet how do organ-grinders live? The sound of grinding is not low among us. On the contrary, let any one sit down for a single hour to some serious employment—such as writing—and even in remote suburbs, even in places where it might be thought no paying audience existed, how many mechanical pianos and harmoniflutes will have enlivened each minute of the sixty? Somebody must contribute to the support of the ill-looking men who grin like their own monkeys at us through the windows. No one seems to have followed *Punch's* suggestion, made some years ago, and suspended a placard threatening organ-men with prosecution before his railings. A combination among a number of neighbours to banish the great musical nuisance would, we are told, be illegal, and subject the members to indictment for conspiracy. It is in vain that, week by week, the newspapers tell us of the morals of Saffron Hill, and remind us that, for the greater part, the dark-whiskered foreigners who favour us with their inspiring strains are "not respectable," are sometimes very much the reverse, and, in many cases, have left the sunny shores of Italy because, even in Italy, a line must be drawn between ordinary and gross immorality. Such revelations are made almost daily. The fair-haired, but not fair-faced, girls who are made into beasts of burden by the piano-men are, we know, unhappy victims of poverty, tyranny, and vice. Were the music they discourse the most lovely in the world, right-thinking people should not encourage it. Some people think the theatre wicked, and many object to the ballet. But what is called a piano-organ on wheels, drawn by two women and worked by an elderly Italian, is a more shocking sight than any to be seen at the lowest music-hall, unless the daily reports are amazingly untrue, and a large class of our fellow-creatures unanimously maligned by those who ought to know.

Many remedies have been suggested for this and similar evils. In some respects things have already improved. The wholesale importation of Italian boys and girls has been stopped, or at least impeded. The girls who drag the organ for the Italian grinder are of our own race and nation. The foreign costume looks all the stranger when its wearer indulges in the use of powerful words culled with the choicest care from the flowers of the Middle Saxon dialect. If the existing laws were carried into effect no further remedies would be necessary. It would be interesting to know why the police and the police magistrates in London habitually ignore the provisions of the Act known to lawyers as 2 & 3 Victoria, cap. 47. By section 54 it is enacted that, within what are called the limits of the Metropolitan Police District, it shall be unlawful for any person, except guards and postmen in the service of the Post Office, to blow a horn or use any noisy instrument for the purpose of calling persons together, or announcing a show, or for hawking, selling, distributing, or collecting anything, or for obtaining money or alms. Surely bands and barrel-organs make use of "noisy instruments" for the purpose of "obtaining money or alms." By section 62 the same Act permits the police to take offenders into custody without a warrant,

to this particular form of street nuisance. The difficulty is of course that, even under the present regulations, which practically ignore 2 & 3 Vic. cap. 47, the organ-grinder when summoned before a magistrate always raises the question of identity. He can bring half a dozen of his own complexion to swear he was entertaining the aristocracy in Belgravia when you thought you saw him grinding under your sick child's window in Tyburnia. The magistrate is not likely to take your view and fine him for creating a disturbance anywhere; and an alibi, as Mr. Weller, senior, long ago pointed out, is very efficacious.

Another street nuisance has lately been the subject of some correspondence in the daily papers. One writer complains in the *Standard* that part of his life is rendered miserable by a man who is in the service of a Dairy Company, and who, early every morning, weekdays and Sundays, makes a round of the neighbourhood. "His voice—which is as powerful as M. Lassalle's, though in other respects there is no resemblance between the two"—is heard while he is yet a great way off, and its noise increases until he is actually under the writer's window, when it is so great "that it is enough to wake the Seven Sleepers." How great this may be we have no means of ascertaining, but the noise is made more disturbing by its intermittent character. "It is impossible to get accustomed to it, as one might to a morning gun." It begins before seven, and goes on with brief and uncertain intervals of repose for two or three hours. We have given this case in some detail, not because it is extraordinary, but because it is only too common. The writer excites in our minds the sort of sympathy we always feel for a fellow-sufferer. Who among us is there who does not recall his own sufferings when wantonly disturbed from "a first and much-coveted sleep"? In one of the western districts some years ago a gentleman engaged in commercial pursuits, it may be supposed, was in the habit of driving his phaeton through the streets at an early hour, presumably on his way to business. He was constantly accompanied by a black dog, which gambolled round the carriage, barking with a bark which can only be compared to the firing of a small piece of ordnance. This nuisance continued for many years—may continue still, for aught we know—and not only was nothing ever done to mitigate the nuisance, but the police, and even the magistrate, when appealed to, declared their inability to interfere. That commercial gentleman would have the deaths of many of his fellow-creatures on his conscience, if he had one. Many similar examples will occur to every one who has lived even a few weeks in London. It is certainly outrageous that one vendor of milk or of anything else should have it in his power to murder the sleep of a number of people by the way in which he chooses to sell his goods. A correspondent of the paper already referred to sums up his experience in a few sad lines:—"Piano-organs of huge size and great power, accompanied by a chorus of foul-tongued roughs of both sexes, yelling milkmen and costermongers, make the day unbearable; barking dogs and howling drunkards make night hideous." The police, it appears, feel themselves to be powerless in the matter. They would gladly take action; but, so far as regards street noises, their hands are tied. They themselves are as anxious as anybody else can be to put some check on what threaten to become intolerable nuisances. Not only do superintendents and inspectors constantly receive letters complaining of grievances which they would like to redress if they could, but also the noises of the night and the early morning are, as may be imagined, as distressing to members of the police force who are hoping to snatch a few hours' rest or sleep between the intervals of duty as they can be even to hard-pressed "brainworkers." The things which we have described or referred to give a truly pleasing picture of the state of London towards the close of the nineteenth century. We seem to be reading an account of some work of Hogarth's a hundred and fifty years old. Yet it is not in the slightest degree exaggerated, and there is no remedy. Mr. Bass's Act, supposing that 2 & 3 Victoria, cap. 47, is still to remain inoperative by the *laches* of the persons who ought to give it effect, enables a householder (*not* an inhabitant merely) to order away one organ, but does not prevent another from coming in its place. No similar act or regulation, so far as we have hitherto ascertained, gives power to a householder, to a superintendent of police, or to any one else, to suppress as a disturbance, on the face of it illegal, the torment of such an appalling street cry as the correspondent of the *Standard* has described. And there is no apparent reason why the cry or cries should not begin at four or five instead of at six or seven in the morning. The police do manage, by stretching a point under Mr. Bass's Act (not under the entirely neglected 2 & 3 Victoria) to keep street music comparatively silent in the case of serious illness. There is, however, nothing which enables them to deal with the noise of a hawker's voice, which may be far worse than that of "a noisy instrument." To put it briefly and fully, a street vendor practically has it in his power to bawl his wares from noon to midnight and from midnight to noon; 2 and 3 Victoria, cap. 47, forbids the tinkling of a muffin-bell, but says nothing of the screeching or roaring of the human voice. The police, whether the case to which their attention is called is one of actual and serious illness, or only one of impending illness and present inability to pursue one's vocations, induced by those street horrors—bawlings of hawkers in the early morning or of "howling drunkards" in the still earlier morning—which are rampant in London, and which would not be tolerated for a moment in the smallest of Continental towns, are powerless. In fact, the sick and dying inhabitants of London are beyond the care of laws which forbid cruelty to inferior animals.

THORNBURY CASTLE AND BUCKINGHAM.

WHILE Cardinal Wolsey was engaged on his palace at Hampton-on-Thames, Edward Duke of Buckingham, his reputed victim, was equally diligent in building for himself a sumptuous dwelling-place at Thornbury in Gloucestershire, but the downfall of both builders happened before they had completed their architectural projects. The longer career of Wolsey enabled him to realize his palatial designs with greater effect than did Buckingham; but even in the latter case enough was done for ordinary domestic accommodation, and to typify the intended grandeur of the whole edifice. Perhaps few readers of Shakspeare's *Henry VIII.* think of the great Duke in connexion with one of the latest schemes of his life—that of building a family seat which should be worthy of the magnificence of the proudest man of the gorgeous court of the second Tudor. Indeed, if we accept Dr. Johnson's estimate of the merits of that drama, the parts of Buckingham and of Wolsey might be suppressed with advantage. "The play of *Henry VIII.*," he says, "is one of those which still keep possession of the stage by the splendour of the pageantry. But the genius of Shakspeare comes in and goes out with Katherine. Every other part may be easily conceived and easily written." If the great Doctor had also said that the woes of Katherine and of Buckingham were easy to bear, it would have been almost as true as this criticism. But out of his own mouth the judge is here condemned, for he has himself (in *The Vanity of Human Wishes*) essayed to depict the character of Wolsey—which in Shakspeare finds much of its expression in the tragedy of Buckingham—but with a want of success compared with the master's treatment which shows that even his strength was unequal to the attempt.

Thornbury was granted by William Rufus to the formidable Robert FitzHamon, by intermarriage with whose descendants it devolved to the Lords Stafford, of whom Humphrey was created Duke of Buckingham in 1441. At the time of the attainder of the last duke the footsteps of this noble family had been for more than a century printed in blood. The great-great-grandfather of Edward was killed at the battle of Shrewsbury, his great-grandfather at the battle of Northampton, his grandfather at the battle of St. Albans, and his father was beheaded by Richard III. The last of the spectral forms which rose before Richard at Bosworth was the ghost of Buckingham, who, instead of wasting an eleventh warning on the doomed monarch, should rather have cautioned his own son against self-ruining ambition. From the height of grandeur the Staffords fell to the depth of impoverishment, the great-great-grandson of Margaret Plantagenet, mother of Henry VII., who married Humphrey de Stafford, the seventh baron, being in 1637 a cobbler at Newport in Shropshire.

In the second year of Henry VIII. Duke Edward had license to impark a thousand acres of land at his lordship of Thornbury. Besides "a large and goodly orchard well laden with fruits, many roses, and other pleasures," and in the same "many goodly alleys to walk in openly, and others covered in with resting-places," there were three parks, containing in the aggregate 1,550 fallow and red deer. That Buckingham was the "mirror of all courtesy" may be understood in the light of Paley's definition of the Law of Honour, which is a "system of rules constructed by people of fashion to facilitate their intercourse with one another"; and, so long as this aim is not interfered with, allows the commission of many offences against religion and morals, including "rigorous treatment of tenants and other dependents." Buckingham's enclosure of land at Thornbury entailed the removal and consequent ruin of many small farming and other tenantry, to whom no compensation appears to have been allowed, at least if we may believe their petition to Parliament against his conduct. The inhabitants of the district, we are told, cursed the Duke for his rapacious confiscation of their lands; and if their maledictions did not cause his downfall, they at least hung about his head until that event. His destruction has been popularly attributed to Wolsey's machinations, though the authority for this is rather dramatic than historical. Shakspeare derived his facts from Holinshed, who literally translated "that old libeller and maligner Polydore Vergil," the only witness for Wolsey's animosity towards Buckingham, who has been unsuspiciously followed, remarks Mr. J. S. Brewer, by Lord Herbert and later historians. Hall, who disliked the Cardinal, and has many kind words for the Duke, says nothing of Wolsey's hatred, which at any rate was not actively excited until the seditious inclinations of Buckingham had become apparent. Certainly the feeling that existed between the Cardinal and the Duke in years previous to the indictment of the latter was one of friendship rather than of hostility, as the State Papers amply demonstrate. At one time Wolsey proposed a marriage between the daughter of Lady Salisbury and Buckingham's son, saying that the King would consent to the match, and that "it would be both to the King's honour and surety" to see them united; while at the same time in familiar conversation he advised the Duke to send his son to court to be acquainted with the King and Queen. It would be difficult to say whether at this period Buckingham was most in favour with

the King or with the Cardinal; but he acknowledges that it was through Wolsey's interest that the Royal kindness was offered. From Thornbury, March 5, 1517, Buckingham writes to Wolsey that he had received a letter from Lord Surrey stating that His Majesty intended a joust on Mayday, and had appointed Buckingham himself to be one of the answerers. That, in his last interview with the King, he found His Majesty so well disposed towards him was through Wolsey's favour, which he hoped would be yet increased by his influence being used to get an excuse from running against the Royal person, which "he would rather go to Rome than do." In the following year (April 12, 1518) the King gave Buckingham a "goodly courser and rich gown," which shows that Wolsey had not yet influenced the Royal mind against the Duke. Moreover, that Buckingham and the Cardinal were still on amicable terms after the return from the Field of the Cloth of Gold (June 1520) may be argued from the instructions given by the former (November 1520), who therein styles himself the "mighty Prince Edward, Duke of Buckingham," to his Chancellor to have a goblet of gold made for a New Year's gift to the King, and pomander and chain of gold for the Queen, and a cup of gold with a cover for the Cardinal.

A misrepresentation occurs at the beginning of the play, where Buckingham asks intelligence from the Duke of Norfolk touching the interview between Francis and Henry in the Vale of Ardres, saying that he himself was the whole time his chamber's prisoner with an untimely ague. But it is certain, from a letter printed in the State Papers, that Norfolk, who declares himself to have attended the expedition, and strains his powers of language to tell how the French "all clinquant all in gold, like heathen gods, shone down the English," really remained in England, while Buckingham was appointed together with Wolsey to conduct the French King to his lodging at Ardres on the last day of the festivities. Notwithstanding the gift, a few months later, of the golden cup above spoken of to the powerful churchman, it may be questioned whether the donor's health was ever drunk out of it; for it seems evident that the Cardinal's suspicions were about this time aroused by a servant of the Duke having betrayed to him certain rash utterances of their master in "his fumes and displeasures" against himself and the King. Though in the late expensive pageantry none appeared with more splendour than Buckingham, yet that an upstart churchman should breathe spirit into these "fierce vanities" offended the stately noble; and no doubt Shakspeare has fairly revealed the very language of the railing accusations in which he vented his indignation. He is "this Ipswich fellow," a "venom-mouthed butcher's dog," a "keech that takes up the rays of the beneficial sun," a "holy fox or wolf or both, for he is equal ravenous as he is subtle." Because of his red attire, or that his sins were of that colour, he calls him that "scarlet sin." He discerns by "intelligence and proofs as clear as founts in July when we see each grain of gravel," that he is "corrupt and treasonous." But it was becoming equally transparent that there was treasonable thought at the bottom of the Duke's conduct. Wolsey's insolent inversion of *Rex et ego* was but a trick of words; but Buckingham's ambition had led him so far into virtual treason that he only required the courage and the power to render himself Wolsey's sovereign.

On a green hill five miles south of Bath, in pleasant contrast to the eternal snow of the Alpine height where St. Bruno established his first Carthusian monastery, are the remains of the Abbey of Hinton Charterhouse, whose materials are now chiefly represented in a stately Elizabethan house of the Hungerfords. Here, however, is the ruined chapel with its groined roof and lancet windows, where once officiated the oracular monk, Nicholas Hopkins, who, as mischievous as the weird sisters in *Macbeth*, led on with his prophecies the proud Duke of Buckingham to perdition. Combining the promises made to Macbeth and Banquo, Buckingham was to be king and father to a line of kings; this the "holy monk" had ascertained by "the revelation of God." The promise of so splendid a destiny was not extravagantly paid for by an annuity of 6*l.* for a tun of wine and 20*l.* for the better supplying of water to the priory. Also, as appears by an entry in the Duke's household accounts, March 25, 1519, there was a further gift of 100*s.* "to my ghostly father at Hinton." Like Macbeth, Buckingham had a profound belief in divination, and possibly for this reason he showed so much respect to gipsies, who, instead of being punished as rogues and vagabonds, were contrariwise rewarded. For example, June 10, 1519, we find in the same accounts, "To certain Egyptians at Thornbury 40*s.*," a largesse which, while it strengthens our belief in the openhanded bounty of Buckingham, may make us almost suspect that these soothsayers had confirmed the prediction of Nicholas Hopkins that the ducal coronet would be converted into a kingly crown. But in his wife, who was a Percy, he found no Lady Macbeth to pour her own fierce soul into his ineffectual ambition, and therefore "I dare not" was likely to wait continually upon "I would."

Charles Knyvet, the Duke's cousin and surveyor, was among the first to betray the aspiring noble, and he found convenient assistance in Margaret Gedding, apparently a waiting-woman of the Duchess, who two years before had received from her generous master the handsome sum of 13*l.* 6*s.* 8*d.* as a New Year's gift. Combined with these in the conveyance of secret information to the Cardinal were Robert Gilbert, Buckingham's chaplain and chancellor, and De la Court, his confessor. Unfortunately for the Duke he appears to have been much unloved, and his foes were of his own household. With the exception that Wolsey was not present, Shakspeare has kept to the historical fact in making Henry himself conduct the preliminary examination of the perfidious servants of the Duke at Greenwich; and he is equally correct in expressing the Royal verdict that the accused noble was "traitor to the height." The evidence of the surveyor is almost a literal transcript of the actual charge that Hopkins had promised the Duke "he should have all," and advised him to obtain "the love of the community"; that he told him "he should be king of England," the Duke answering that he would "prove a just prince." The accused had declared he would "chop off Wolsey's head" as soon as his own had received the golden round—a threat which is softened in the drama to a menace of "revenge upon the Cardinal." It is also in strict keeping with the facts of the indictment that the Duke had expected to be sent to the Tower on account of his taking Bulmer, one of the royal servants, into his retinue, and had sworn "by the Lord's blood" that, had he been so committed, he would have sought an interview with the King and stabbed him on the spot, as his father had threatened to Richard III. at Salisbury. But this, like the rest, was a mere threat. No machinery of plot had been constructed, nor any maturity of design attained, the whole conspiracy resting on some wild astrological deductions which had given assurance to the credulous Duke that his descent from the Plantagenets would ensure him the crown on the King's death. The most serious indication of an actual plot was his having obtained the royal license to attach any of the King's subjects he pleased dwelling within the shires of Hereford, Gloucester, and Somerset, and "to carry arms at his pleasure into Wales," which was construed into a design of "fortifying himself against his Majesty." He had informed the Cardinal that it would be necessary to take thither three or four hundred men, his own servants. His numerous band of retainers was enough to excite suspicions in so jealous a monarch as Henry; but, whatever his ultimate intentions were, there was evidently no organization against the Government.

In the dramatic scene Buckingham is arrested in the ante-room of the royal palace in London, while denouncing the Cardinal to the Duke of Norfolk. He was, in fact, watching the growth of his palace at Thornbury at the time when he was peremptorily cited to the Royal presence. Three knights of the King's body were the summoners, who, taking with them "secret power and also serjeant-at-arms," had been warned not to let their prisoner escape. His fatal journey in the month of April 1521 may be traced by the diary of his accounts. The messenger with the King's letter on the 8th receives one mark. On the 14th he is at Oxford, where he pays 26*s.* 8*d.* to Dr. Bentley his physician. At Reading he makes an oblation of 6*s.* 8*d*, to the Child of Grace; and on the 14th he offers the like sum to "Our Lady of Eyton, near Windsor." Hitherto he had been unconscious of the spies who had been watching him at each saintly shrine, and never lost sight of him in town, village, or highway. But his heart now failed him, like Macbeth's when the woods began to move, at seeing armed men at each turn of the road drawing closer upon him. The Duke found he was a prisoner, and he guessed why. Ordering his horse, he rode to Tothill Fields. On taking his barge and landing at the stairs of the Cardinal's palace, and being refused an audience with his Eminence, his worst suspicions were confirmed. "Well," said the Duke, "I will yet taste of my lord's wine ere I pass." He was courteously shown to the cellar, and one of the latest entries is on April 15, "To my Lord Cardinal's cooks at his place beside Westminster, 20*s.*" On the next day he was committed to the Tower. The 13th of May he was brought before his peers in Westminster Hall. According to Hall, "he chafe sore and sweat marvelously," and Shakspeare repeats the circumstance. By the unanimous vote of his peers, he was declared guilty of high treason. Upon his condemnation the axe was turned towards him, and, being led into a barge, "Sir Thomas Lovel desired him to sit on the cushions and carpets ordained for him; he said 'Nay, for when I went to Westminster I was Duke of Buckingham, now I am but Edward Bohun, the most caitiff in the world.'" On the following Friday six poor Augustinian friars gathered up the remains of the once stately Buckingham, and reverently gave them burial in their Priory Church within Broad-street Ward.

Leland's description of the township of Thornbury, as one long street with two horns growing out of it, answers to its present form, it being in fact three streets in the shape of the letter Y, the castle and church answering to the cross stroke at the foot of the letter. The castle with its unfinished frontage is as typical of the voluptuous days of the Field of the Golden Cloth as is the neighbouring fortress of Berkeley of the unruly days of Stephen. In the former architectural display was only less studied than luxurious accommodation; while in the latter convenience was almost as much disregarded as picturesqueness of form, security being the only aim. Windows at Berkeley are features externally as undemonstrative as in a Doric temple, while at Thornbury they are as nobly decorative as they are serviceable. The keep, which at the former is the most important part of the stronghold, is altogether absent from the latter, which in fact is no stronghold, but, like the Cardinal's palace at Hampton, a lordly pleasure-house, the embrasures and machicolations being no more intended for defence than the pictured panes of the oriels. The outline is quadrangular, with bold projections; but the northern side is not begun, and no side is finished. Entering the base court by a modern lodge-gate at the south-west angle, we find on the right, or western side, a range of uncompleted buildings, in the centre of which is the principal gateway, a vaulted structure with a smaller gateway annexed. Here we are in the immediate

presence of the ducal architect. A waving scroll above the entrance informs us that "This Gate was begon in the 2 yere of the Reigne of Kynge Henry the VIII. by me Edward Duke of Buckingham, Earl of Hereford, Staforde and Northampton." Passing into the inner court, we find three sides of a quadrangle, of which the north was occupied by the kitchen and stables, and the south by the great hall and the Duchess's apartments, above which are the dining chambers and priory chambers, the great octagonal tower at the south-west angle serving for the Duke's chambers. These principal apartments, instead of being lighted, for security, from the inner court, as at Berkeley, have noble bay windows of various sections dropping vertically from parapet to basement, facing the garden court. If we accept this splendid façade as an example, we may believe that the science of Gothic architecture in its decline was worthy of its meridian beauty. Pugin, in his *Specimens of Gothic Architecture*, gives measured drawings of nearly every external feature of Thornbury Castle.

The confiscation of the Duke's estates consequent upon his attaintment reduced his family to indigence, Lord Henry Stafford, his eldest son, being compelled to take refuge with his wife and seven children in an abbey, where for four years he was boarded at the expense of the monks. The manor of Thornbury became a Royal demesne, and as such was visited in 1535 by Henry VIII. and Queen Anne Boleyn. It was subsequently regranted to the Lord Stafford one of whose descendants on the female side, Mr. Henry Howard, of Grey Stoke Castle, came into possession of the property in 1824. Of the parish church, with its noble clerestory and tower, we can here say no more than that it is worthy of the stately Buckingham.

A SCREAMING SUCCESS.

THE virtue, or grace, of maidenliness in girls is one that the present age does not very highly esteem. It is a more successful thing to be "jolly" than to be gentle and modest, and a girl who would "get on" finds it necessary to distinguish herself by wearing rumpled hair or a flame-coloured ulster greatcoat, or departing in some other way from the graces of her sex. Where life is crowded and rapid in its movements, notoriety is almost as necessary to ambitious young women as to proprietors of patent medicines. Thus it is not strange that maidenliness should be hustled out of existence. It is a virtue which is not in harmony with the modern "environment." It must disappear, like the duty of revenge and the practice of tattooing.

These reflections are almost forced upon us by the perusal of a singular little American book called the *Confessions of a Frivolous Girl*. If this Yankee maiden's "Confessions" could be accepted as truthful and authentic, one might maintain that feminine reserve and modesty were almost exploded superstitions in the society of New York. Manners, like the game of "Boss," the electric light, and many other Yankee "notions," come eastward from New York to Europe. Not a few English maidens may parody a line in the *Anti-Jacobin*, and exclaim,

What New York is let modern England be,

when they read the autobiography of the Frivolous Girl, and hear what a "gorgeous time" she enjoyed. But to take the frivolous one's statements for authentic history would be too innocent. It is only fair to say that the picture she draws of New York society may be quite unlike the original. The little book may be written by some one who knows nothing of the world described. The thing may be a caricature, and not a good-natured one. The book is published at Boston, and even in England we know how the natives of Boston and New York love each other. With all these limitations there may be a grain of truth in these papers, in which the author, to quote the magistrate in the *Cloches de Corneville*, "frivols too much."

The experiences of a "bud" are unfolded in the artless narrative of the frivolous virgin. A bud, in the dialect of New York, is a young lady in her first season. This Bud belonged to one of the "first families," and it is interesting to note the nature of New York aristocracy. To be descended from one of the old Dutch settlers answers to having "come over" with the Conqueror, or, in Boston, with the *Mayflower*. But there are people in society, of course, who only came over in the steerage quarter of a recent emigrant ship. It is astonishing to remark how readily these gentlemen and ladies acquire the grace and charm and peculiar tone of the first families. One would expect the first families, when they found English inadequate, to express themselves in choice Dutch. But it is not so. Fashionable lips murmur the sort of French with which the guardsmen of Ouida have made us familiar. Among the friends of the Bud was a Mrs. Gatling Gunn. She pronounced her name "Goon," on the analogy of "skoonk" which seems to be the correct way of saying "skunk." This lady became the Bud's friend and tutor. She knew, she said, that she was *roturière*. Her father had been for many years a butcher. "I shall never forget, if I live to be a hundred, that these bejewelled fingers have been in contact with raw mutton-chops." Her general advice to the Bud was to skip through life as if she were dancing the *can-can*. Here the caricaturist has gone a little too far. "Have you ever seen the *can-can*, my dear? No, of course not. Well, in order to become what is called in society a screaming success, one must, in figurative language, dance the *can-can*, and dance it well, too." Thus instructed, the worthy Bud attempted to become what is called in society a screaming success. "I think that I have at times experienced that can-can feeling," she says. We may now follow the Bud to her first ball, and see her go booming, "as they say in society," down her path of triumph.

The Bud started for her first dance armed and equipped with three bouquets. Only two of these had been presented to her by young men, and this was what the old Scotch divines call a "crook in the lot" of the Bud. Her aunt had sent her one of the nosegays "of roses and mixed flowers. Ugh!" cries this innocent creature of eighteen, "why is it that women never know how to send flowers to other women?" Perhaps their ignorance may be accounted for by want of practice. The other blossoms were the gifts of "a thoughtful male cousin," and of a Mr. Manhattan Blake. The Bud reflected with pleasure that her trophies would make the other girls "as mad as hops." At her earliest dance she made the acquaintance of Mr. Gerald Pumystone, who was "one of the leading young men in society," and of an "interesting-looking creature" who had big, sympathetic-looking brown eyes, and was known to the world as Harry Coney. Mr. Manhattan Blake was also there, among many other "stylish-looking creatures"; and Mr. Blake could quote French with the best of them. He had also a yearning, half-sad expression on his pale face, and a mysterious, almost inspired, light in his grey eyes. He thought that the life of Kenelm Chillingly was "almost ideal." Mr. Coney was not rich, like Pumystone and Blake, but "for anything on this side of the altar he was almost heavenly." There is a sufficient latitude of performance on this side of the altar, and the Bud was perhaps to be congratulated on her friends.

With them she often had "a real gorgeous time" on the stairs and in conservatories, discussing love in the abstract. The Provençal Courts of Love seem to be revived in New York, and the casuistry of the passion is earnestly debated by young men and maidens. Mr. Pumystone took up this subject at once. After asking the Bud whether she had ever been told that her eyes were liquid, he went on to say that he himself was a mere amateur. "It is absolutely necessary *que je m'amuse*, amuse myself, you understand. *De beaux yeux* are indispensable to my happiness; but I must have variety, *comprenez vous?*" As the Bud liked this kind of thing, she was "registered on the tablet of social statistics as a success." No one was more frequently and liberally "bunched" by young men. "Laden with flowers I went forth from the parental roof, and returned to the parental roof laden with flowers, very early every morning." "Nothing was so enjoyable to her as to converse about love in the abstract with an attractive man." She went to walk in the streets of New York city with attractive young men. They chose streets rather out of the beaten track, and had most delightful discussions as to whether it is nicer to love or to be loved. Mr. Blake confided to her that, at the mention of revealed religion, he "smiled a mournful smile, the smile of the iconoclast, who has nothing to suggest as a substitute, but still a smile." We wonder if the smile of Mr. Bradlaugh is mournful. As Mr. Blake had not read Mr. Arnold's most recent work, he could not of course suggest poetry as a substitute for revealed religion. While one attractive man thus merged flirtation in theological confidences, another discussed with the Bud the nature and constituent elements of human bones, and the Bud made him write down his analysis. She was "in the seventh heaven" with Mr. Coney, the young man who was so heavenly on this side of the altar, but she "showed him plainly that she did not like it when he said anything at all *risqué*." The first cousin to the Earl of Hammerhead, an English gentleman named Hare Hare, was much adored at this time by New York. The "Hon. Hare Hare," as people called him, was as rude, as slangy, as mannerless a cub as other young Englishmen in other American romances. Do our countrymen really behave like costermongers on the other side of the Atlantic, and is this conduct the result of the attentions which they seem to receive from the society of the United States? Most people know lords and even "Hon.s" in England who are not absolutely brutal, and whose conversation is not full of the words "beastly" and "filthy." The Englishman of American fiction is a singular contrast to the Englishman of French novelists thirty years ago. He is simply an untutored cad, and yet he is courted by the Mrs. Gatling Gunns of romance. How much of the picture is true to life, how much is pure invention? We cannot pretend to say; but the picture is repulsive enough, and does little credit either to the old country or the new.

When the New York season was over the Bud went to Newport, a watering-place. Here people played lawn-tennis, at which sport the Bud's admirers told her she was "no slouch." Mrs. Gatling Gunn drove about with "darling duds of ponies," and life was "quite too ideally charming." The Bud "flirted with charming people whom she had never met before—such was the delirious round of our days, but it was fun." In her second season the Bud says she "went it hammer and tongs," till "Papa said we must shut down on this." But he did not shut down on it, and the Bud still went it, as mad as hops, and as smiling as a basket of chips. She despised steady girls, and called them "whopper-jawed," a charming term in itself, but obscure in meaning. She had "ten slaves"—that is, ten attractive men—with whom she says she read "Austin Dobson's *Vignettes in Rhyme*." "Galeotto fu il libro e chi lo scrisse," as far as flirtations went. She betook herself to a place called "Mt. Desert," where all the men were said to go about in flannel shirts, while the girls "never did their hair." "The average girl who goes there gets the pollen rubbed off her wings"; but the Bud

went, and "went it." She "*was* just a *little* free and easy" with Ernest Brooke and "another young man who was kind to her when the other was not around." But we are tired of going around with the Bud. She was not whopper-jawed, she was no slouch, but she was scarcely the ideal English or American maiden. The particulars of her interesting conversion may be studied by the curious; it is enough for us to have examined, in the case of the Bud, "what is called in society a screaming success."

It is not certain that what we may call Budism would at once become fashionable in England. But is not the experiment well worth trying? Young ladies who are conscious of not being whopper-jawed may go it hammer and tongs, and, at the worst, can publish their memoirs, like the Frivolous Girl.

THE COTTON TRADE.

THE recent abortive strike at Blackburn has brought to the knowledge even of those who in general pay little attention to commercial matters that an improvement has taken place in the great staple industry of Lancashire. For four years the cotton trade had been depressed. Multifarious labour disputes occurred, the object of the operatives being to prevent a reduction of wages. But at length we had last month a strike for an increase of wages. It is true the strike failed, the majority of the workpeople acknowledging that the manufacture of cotton cloth is not yet sufficiently profitable to admit of the advance demanded. Still the dispute was preceded, and in a certain sense provoked, by a rise of 5 per cent. in the wages of spinners. It is something to find that even one branch of the industry is in a position to raise wages. Since the Whitsuntide holidays doubts have been expressed as to whether the rise had not been too hastily granted, and hints have been thrown out that it may be necessary to reduce wages again. But the fact remains that the advance has been conceded, and consequently that one important branch of the cotton industry has in recent months recovered, at least temporarily, from the depression which had weighed upon the trade for four years. In their Review of 1879 Messrs. Ellison estimated that in each of the four years ending with December last the cotton manufacture had been carried on at a heavy loss, a loss growing more heavy as the years went on. At length, in the final quarter of 1879, there was a great change, a profit being realized on the transactions undertaken. Yet the profit was not sufficient to prevent the losses on the whole year from being the heaviest of the series. The revival that set in towards the close of 1879 continued through the first quarter of 1880. But during the past two months there has been a decided check to the improvement. Complaints are sometimes heard that the revival has completely died out, and that the trade has fallen back to the condition it was in last summer. This, however, is an exaggeration. There is greater activity than there was twelve months ago, and with it greater hope and better prosperity; while there are symptoms of further improvement yet to come. Still there is undoubtedly a check.

The cause of the sudden improvement in the autumn of last year was a revival of the demand from the raw-material-producing countries, more particularly from India, China, Japan, Egypt, Turkey, Chili, and Brazil. The raw-material-producing countries are our principal customers for cotton goods. The cotton manufacture, being one of the longest established, and from the rapidity of its growth and the magnitude to which it has attained having attracted the envy and admiration of other countries, has been everywhere imitated by the more advanced nations; and by means of protective duties they have nearly succeeded in building up a native industry capable of fully supplying themselves. The English manufacture is still by far more important than the foreign, the consumption of the raw material by the spindles of Lancashire averaging at the present time 65,000 bales a week, while that of the whole Continent averages only about 52,000 bales, and the potential consuming capacity of Lancashire exceeding that of its competitors in a far higher ratio. Yet the fact is, as we have said, that the Continent now so nearly supplies itself that our exports thither do not increase, and consequently we are dependent for a market for our growing production upon the more backward countries. The situation has its compensations for us as a community; the advance of our neighbours in wealth, and their application of so much of their labour and capital to the spinning and weaving of cotton, making them our customers for other commodities. But whether that be so or not, the change is inevitable, since we cannot hope always to remain the sole manufacturers of the world. Yet indisputably the situation has its disadvantages. The raw-material-producing countries are backward, and possess but little capital; they are dependent, too, upon the seasons for prosperity, and, owing to the time that elapses between the sowing and the reaping of a crop, they are not able quickly to adapt themselves to changes in the markets. On the other hand, these countries are growing, and therefore likely to become better customers; and as they are scattered all over the globe, and bad times seldom occur universally, it is not often that we have to dread a complete collapse of the cotton trade. This did, however, happen in the four years just ended, and, over and above the causes of the depression that prevailed in all commercial communities, it is traceable to the famines in India and China, the difficulties of the South American States, the bankruptcy of Turkey, and its war with Russia. The cessation of famine in India and China, the recovery of the South American States, and the re-establishment of peace in the South-East of Europe have in turn revived the demand for cotton goods. In the first five months of the current year, not to go further back, the imports of cotton goods into India, for example, exceeded by 156 millions of yards those of the corresponding period of last year; that is, the increase in the five months of this year of the importation into the three Presidencies exceeded by 50 per cent. the total imports into Bombay in the first five months of last year. To Brazil, again, the imports exceeded those of the corresponding five months of last year by nearly 50 per cent.; while in the case of Chili the excess was actually 150 per cent. Bearing in mind the war in which Chili is engaged, and the strain it imposes on her resources, this growth of the cotton imports is very remarkable, and makes us fear that the business may have been overdone. The more moderate increase in the case of Brazil is not surprising, as the Empire is recovering from prostration. In the case of Turkey the increase is almost 25 per cent., and in that of Egypt between 30 and 40 per cent. There is also a very satisfactory increase for the five months in the imports into Portugal, the United States, British North America, the West Indies, the Philippine Islands, and the Straits Settlements.

The wide area over which the improvement is spread, and the varying conditions of the countries in which it manifests itself, afford ground for hope that it will prove permanent. Had the whole augmented demand come from a single community, or from a group of communities nearly similarly circumstanced, it might be due to some exceptional cause that would soon cease to operate. But it is difficult to believe that regions so wide apart, and so unlike in all essential respects, as the United States and India, Portugal and the Straits Settlements, Turkey and the South American States, can all have been led, by an exceptional and passing cause, at the same time, to begin buying English cotton goods more largely, and to have kept up their increased purchases for months together. The falling off in the trade of Lancashire militates against this inference, but does not disprove it. The cotton manufacturers shared in the speculation which was generated by the extraordinary prosperity of the United States last year. From the despondency into which they had sunk they suddenly passed into a state of over-confidence. Good crops in India enabled the ryots to buy clothing more freely; and the symptoms of an improved demand in the East, while prices were rising in America, induced merchants to speculate wildly. In the four months ending with February there was eager competition in America, India, and Egypt for raw cotton, and so large was the quantity bought up, that during the three months that followed more than one-third of the consumption of Lancashire was from the stock thus accumulated. Simultaneously, the exports, especially to India and China, assumed extraordinary proportions. As during the famine years the peasants had been obliged greatly to restrict their purchases, there was a large real demand for the goods. But the rise of prices consequent on speculation checked it, and dulness has succeeded to the feverish activity witnessed at the beginning of the year. The troubled state of so many of the South American countries has also had its influence; but the accumulation of stocks in the East during the period of speculation will gradually be worked off, and with low prices it may be assumed that the demand will revive, if the crops are again good this year. In the United States, Egypt, and India, last year's cotton crop was abundant and excellent, and the acreage planted this year is larger still. The price of the raw material may therefore be expected to continue moderate. And if our own harvest turns out well, the home demand will improve. Thus the prospects of the trade depend greatly upon the weather. Good harvests in Europe and the East will ensure prosperity, but without them there can hardly fail to be a relapse into depression.

THE THEATRES.

THE novel experiment which is now being carried out at the Imperial Theatre is from an artistic point of view a marked success. The Dutch company of actors who are there presenting a variety of pieces are admirably trained artists; they count among their number several players of unusual talent and versatility, while all concerned in the representation are thoroughly practical and efficient, and the grouping and stage management are as good as anything that has been seen for years on the London stage. The company was, we believe, first started as the result of a secession on the part of some of the troupe from the State Theatre of Holland, and the completeness of the performances now being given affords another proof that State aid is not necessary for the development of a theatre in which considerations of general effect are not subordinated to the pretensions of a "star" actor or actress. The earnestness and skill with which in these representations an actor who one night plays a leading part assumes on another a character of comparatively trifling importance make one of the most noteworthy and pleasing features of the affair. The same thing was observed on the first visit of the Comédie Française to London in 1871; but the reason for it then was the numerical weakness of the company. It was only to be expected that the audiences at the Dutch plays should be small. There are not many English playgoers who are familiar with Dutch as a spoken language; and, although it is possible that half the people

who flocked last year to the Comédie Française at the Gaiety understood as much of their performances as they would of those to which we now refer, yet nobody is ashamed of confessing to an ignorance of Dutch, while everybody is supposed to have a knowledge of French. It would have been better from every point of view if, before they came over, the Dutch players had issued copies of the pieces which they perform, with a close English translation printed on the opposite page. This was done —very badly, it is true—when Signori Salvini and Rossi came here, and when there was far less need for it than there is now. Failing this, they have done the next best thing by issuing a *scenario*—which it must, however, be admitted, is in some cases neither accurate enough nor full enough—of each piece. With the aid of this and with a tolerable knowledge of the German tongue and his own, the English playgoer can follow what is going on quite closely enough. Of course the slightest smattering of Dutch, which is not a very difficult thing to acquire, will help him out. But without any of these aids the practised playgoer would be able to make out the general scope and action of the piece by reason of the expressive intonation and the extreme clearness, significance, and decision of the gesture employed by all the players. We have dwelt at some length on this matter, because it seems to us a great pity that people should be kept away from some of the most artistic dramatic performances that London has seen by an exaggerated sense of the difficulty they might find in understanding the pieces given. It may be added that now that *Vriend Frits* has been produced, any one who chooses to procure a copy of *L'Ami Fritz* will obviously be able to follow the piece with comparative ease.

Amongst the pieces which have been performed by the excellent company directed by Messrs. Le Gras, Van Zuylen, and Haspels, have been *De Militaire Willemsorde*, *Janus Tulp*, *Anne-Mie*, and *Marie Antoinette*. Of these, the first two were performed on the same night. *De Militaire Willemsorde* is "a dramatic sketch," written by Mr. Rosier Faassen, who himself sustains its principal character, Van Baalen, an old pensioner, decorated with King William's military order "for Valour, Judgment, and Fealty." The little piece, which is very prettily and ingeniously constructed, turns upon the fact that one of the old man's sons, Willem, has quarrelled with his father, and left his home, with the assurance that the father will never forgive him. He has joined the navy, and a letter, written when he was dangerously wounded and prepared for death, has been received from him. Van Baalen, who cannot read, has been kept in ignorance of this, but it is read out to him by chance by his little grandson, Willem's nephew, and affects him so powerfully that he swoons in his chair. Meanwhile, however, the missing Willem has turned up safe and sound, and his brother and sister-in-law have been plotting how to bring about a reconciliation between father and son. This is done by first pretending that the grandson has only read part of the letter, and reading, as if in continuation of it, a second one, written since the prodigal's return, and then by gradually preparing Van Baalen for the appearance of Willem, who is now, like his father, decorated with "De Militaire Willemsorde," and upon their embrace the curtain falls. The play depends, it will be seen, upon the skill of the actors in domestic pathos; and its success was striking. Mr. Rosier Faassen's sketch of the old disciplinarian, his gradual melting from sternness to grief, and the change from grief to joy, was remarkable. The other parts were admirably played by Messrs. Chrispyn and D. Haspels, Mrs. Faassen Van Velzen, and Miss Van Ryk. In this play, as in the others which we have mentioned, the general completeness of the performance; the care, close, but never obtrusively minute, given to detail; and the playing into each other's hands of all concerned, commanded attention and admiration. Mr. D. Haspels, who in this piece appeared for a few minutes as the returned son, played admirably on a subsequent night the long and important part of the King in *Marie Antoinette*, in which play Mr. Rosier Faassen sustained with striking skill the small part of Simon. *Janus Tulp*, a comedy in four acts by Justus Van Maurik, jun., has some points in common with *The Upper Crust*, in which Mr. Toole still continues to delight his audiences, whilst its first act recalls the opening scene of Thackeray's *Cox's Diary*. Janus Tulp, a barber and undertaker, is discovered shaving a customer, and at the end of the act, just as he has donned his undertaker's garb to attend a funeral, receives from his assistant Barend—who corresponds more or less to Orump in Thackeray's story—a letter which announces his sudden accession to wealth. We need not go at length through the plot of the piece, the course of which the experienced playgoer will probably foresee. The situations are good, and are well worked up to; but this piece, perhaps even more than the one which preceded it, depends for success upon the merit of the acting. Mr. W. Van Zuylen played excellently as Janus Tulp. His growing excitement while he read the letter telling him of his unexpected riches, and the dance of joy which, in his full undertaker's costume, he executed at the end of it were irresistibly comic. A special point for commendation may be found in the absence of exaggeration in his subsequent acting as the vulgar man suddenly endowed with wealth. Mrs. Van Offel-Kley appeared to marked advantage as Betje, Janus's sister-in-law, as did Mrs. Chrispyn-Stoelz as the daughter Marie. Mr. Van Nieuwland played a titled but unscrupulous adventurer, whose speech is riddled with scraps of French and English, with considerable cleverness; and Mr. Chrispyn, as Janus's son, was especially good in the scene in which he exposes the scoundrel. A word of praise is due to Mr. A. Van Zuylen for his performance of Barend.

One could hardly have guessed from the representation, good as it was, of these two plays, that the same actors would appear with such complete success as they did in *Marie Antoinette*, a translation by Mr. Spoor, one of the Dutch company, of the piece originally written by Signor Giacometti for Mme. Ristori. The distinguished Italian actress's part was filled by Miss Catherine Beersman, who played it with complete and striking success. Her dignity was no less remarkable than her force and pathos. The admirable grouping, costuming, and stage-management of the play combined to give it a strangely vivid effect. It was as if one were actually carried back into the terrible time with which the drama deals. Few scenes more thrilling have been seen on the stage than that in the first act, in which a vast crowd, heard, but not seen, assembles under the Royal windows at Versailles, and in which the curtain drops upon Lafayette's hurrying to the balcony, and winding his tricolour scarf round the Queen and her children to protect her from the fury of the mob. Nor is it easy to imagine a scene more harrowing in its pathos than that of the farewell between the King and his family. Here the fine and powerful acting of Mr. D. Haspels had much to do with the result attained; but his indication in the earlier scenes of the King's curiously mixed character was artistically no less successful. On the same grounds, as well as on account of her admirable rendering of strongly emotional passages, Miss Beersman's Marie Antoinette calls for special attention. Every part in the piece was well filled, but special mention may be made of Mr. W. Van Zuylen's Lafayette, of Mr. Spoor's Santerre, and of Mr. Rosier Faassen's almost painfully vivid representation of the brutal Simon. His singing of the Carmagnole (which, by the by, he should sing in Dutch, not in French) and his exit taunting the King had in them an almost appalling ferocity. We trust that the play may be given again. Its representation by the company of Messrs. Le Gras, Van Zuylen, and Haspels should be seen by all playgoers who care to see a piece played and put upon the stage with complete artistic feeling and skill.

Anne-Mie is a domestic drama, the scene of which is laid in Zeeland, of semi-tragic interest. It is written by Mr. Rosier Faassen, of whose skill and versatility as an actor we have already spoken, and it gained the first prize for national dramatic composition at Antwerp in 1878. Its construction up to the last act is decidedly good, and its episodes have a special interest, since they illustrate with much liveliness, and in a natural way, the manners and customs of Zeeland. The accuracy of the costumes —the date of the play is between 1850 and 1868—is vouched for in an introduction to the published *scenario*. As the heroine who gives her name to the play, Miss Beersman makes another decided hit, and the naturalness of her pathos shows that what might seem at first sight like artificiality in her Marie Antoinette, was in fact the result of a manner deliberately, whether wisely or not, assumed. It is to be regretted that Miss Beersman should spoil in this part the effect of a truly pathetic scene by condescending to take a "recall" in the middle of an act. This is a practice which cannot be too strongly reprobated.

Mr. Rosier Faasson, the author of the piece, gives us a striking piece of acting as the man whom we see at first as the rich, ambitious, and vengeful tenant-farmer, and afterwards as the aged, broken-down, and half-crazy victim of his own misdeed. Mr. W. Van Zuylen plays a rustic hero with much "go" and naturalness, and adds much to the effect of one of the episodes already referred to by his singing and dancing. Mr. J. Haspels gives an excellent picture of a man whom nature and circumstance have combined to make into something like a villain. As in the other pieces of which we have spoken the small parts were admirably filled. The *verve* of the whole performance should go far to break down the common belief that the Dutch are an essentially phlegmatic people.

The Bells, which is now given on Saturday nights at the Lyceum, seems to have lost none of its popularity. To those who remember the earliest days of the piece its present revival is peculiarly interesting. The piece has perhaps never been so well cast all round as it now is, and the changes in Mr. Irving's acting are very well worth watching. In the earlier scenes increased art and experience have tempered impulse, with the effect of strongly-marked improvement. We could point to many salient instances, but will dwell upon one only —the reply of Mathias to Christian, who has lighted upon the exact truth of the circumstances of the murder committed, unknown to every one, by Mathias. The body, Christian says, must have been consumed in a lime-kiln, and that is the clue which should have been followed up. At this Mathias turns on him with "Take care, Christian, take care! I myself owned a lime-kiln at the time." Mr. Irving used to give these words with a wild laugh, inspired partly by fury, partly by terror, and partly passing into an attempt to conceal his agitation. He now lets out the words as if by an uncontrollable impulse, begins or suggests a nervous laugh, and on hearing and seeing it caught up by Christian, joins in with a hard mechanical laugh, just touched with hysteric passion, which is far more impressive than the one which he used to employ. The scene in which Mr. Irving has in certain points decidedly not improved is that of the dream. His acting of the murder was always daring because it approached without ever reaching the grotesque. We will not say that it has yet come close to the dangerous point; but, on seeing it a few nights ago, we felt more afraid of what might come next than we had done on any previous occasion of witnessing a strangely fascinating piece of acting.

RACING AT ASCOT.

THE racing on the Tuesday of the Ascot week is generally some of the best of the year, but this was far from being the case at the late meeting. Beforehand, the first day's programme had appeared excellent. More than one hundred and twenty horses had arrived for the races, and everything seemed to promise excellent sport, but when the day arrived this promise was not fulfilled. The first race was won easily by the favourite. The second was fairly run away with by a two-year-old by Rosicrucian, called Capuchin. The next race was for the Gold Vase, which, by the way, is neither a vase nor gold, but a silver shield. Only two horses were saddled for this affair. The favourite was Chippendale, the winner of the Great Metropolitan Stakes, the Cesarewitch, the Ascot Derby, the Hardwicke Stakes, and other races. Nine to four was laid on him, but backers remembered that when they laid the same odds last year on Silvio for this race he was beaten by Isonomy. Chippendale's solitary opponent was Fashion, the winner of the Chester Cup and the Epsom Cup. In the Metropolitan Stakes, Chippendale had given Fashion 36 lbs. and beaten her by a length, and now he was only to give her 22 lbs.; his victory therefore seemed as certain as anything in racing can be. For some reason or other, however, many people fancied Fashion, and it was hoped that there might at any rate be a good race. The pair galloped side by side until they turned into the straight, when Chippendale came away, and won just as he liked. Both the horse and the mare are wiry and good-looking animals, and they are both good stayers. We made some remarks about the Prince of Wales's Stakes last week, and it is sufficient to add that, like the Gold Vase, it was won by Lord Bradford. Nine two-year-olds came out for the Biennial, and odds were laid on Angelina, a bay filly, by Hermit, which had won the Woodcote Stakes at Epsom and two other races. All seemed to be going well with the favourite until she was within fifty yards of the winning-post, when a bay colt called Sir Charles came up with a rush, and won the race by half a length. The Ascot Stakes was a dull affair. Teviotdale was made a very strong favourite. Only seven horses went to the post, yet there was a long delay before the start, in consequence of the misbehaviour of the favourite, who tried very hard to get rid of his jockey. The race was a very hollow affair, for Teviotdale came away when he pleased, and won by five lengths.

The racing on the Wednesday began in drenching rain. Gentlemen who had the courage to face the weather and plunge into the ring managed to back the wrong horse under their umbrellas for the first race. They made Bonnie Marden, who had been second in the Oaks, the first favourite; but the extreme outsider L'Eclair won the race very cleverly. The good-looking Evasion ran in this race, but she seems to be a jade when it comes to a struggle. Backers will not like to trust her for the future, but she is just the sort of mare who may win a great race some day when least expected. Both Mask and Merry-go-Round ran in the Ascot Derby. The latter had beaten the former in the Column Produce Stakes at Newmarket; but it was very properly thought that this running must have been all wrong, and Mask won the Ascot Derby in a canter, Merry-go-Round being third only. The Biennial was very uninteresting. 2 to 1 was laid on Petronel, and he won by four lengths. Thirty-one horses went to the post for the Royal Hunt Cup. Ruperra, who had won the Great Yorkshire Stakes and the Doncaster Stakes last year, was the first favourite; and he did not seem overweighted with 7 st. Sir Joseph, who had been in 1877 one of the most promising two-year-olds of his year, was almost, if not quite, as good a favourite. As is often the case in the Hunt Cup, there was a tedious delay at the post. It was but a poor race after all. Strathern came away some distance from the winning-post, and, shaking off all his opponents, won in a canter by three lengths. Lord Clive, who, it will be remembered, had been a good horse two years ago, was second. Tertius was third. As much as 40 to 1 had been laid against the winner, 33 to 1 against the second horse, and 25 to 1 against the third horse, before the start. Strathern had been beaten in every race for which he started last year. Another outsider won the Fern Hill Stakes. Dourance was the favourite, but she seems to have lost her form this year. Toastmaster and The Song were also running; but the winner proved to be Tafna, a filly belonging to Count Lagrange, which had been beaten three times this year. Backers were little more successful in the Triennial for two-year-olds, which followed. They made the very handsome, but very backward, Town Moor the first favourite. He is a magnificent colt by Doncaster, and had cost 1,000 guineas as a yearling. Errand Boy, who had run a good third to Tristan and Angelina at Newmarket, was second favourite. Both these horses, as well as two others, were beaten by Kühleborn, a colt by King of the Forest, who had been out several times before; but he only won the race by a neck, and if Town Moor, who ran second, had not been so green, the result would probably have been different. The last race of the day was chiefly noticeable for a very nasty accident. As the horses were half way up the straight, one of them swerved, and, cannoning against another, knocked it down. It was a horrible-looking fall, for the horses were racing at their best pace, and the falling horse appeared to roll over its jockey; but, although very severely shaken, the poor boy is said to have escaped any serious injury. It was an unpleasant ending to the day's sport.

We have already mentioned a good many defeats of favourites at the Ascot meeting, but one of the greatest surprises was in the first race of the Thursday. Odds were laid on Discord, who had been bought in for 5,000 guineas at auction at Newmarket in the spring, after a genuine bid of 4,500 guineas had been made for him. Petronel, more heavily penalized, was the second favourite, and 20 to 1 was laid against Cipolata. Some little mistake had been made in these calculations, for the despised Cipolata won easily by two lengths. She had been unplaced in the One Thousand, but she had won four races out of six last year. The beating that she now gave to Petronel, who was fourth, more than made up for her advantage in the weights, and if this running were true, it would make her out a trifle the better of the pair, at weight for sex. Elizabeth, the winner of the One Thousand, won the next race, with 12 lbs. extra on her back. She is a nice mare, and has improved since she came out in the spring. The following race was the most important two-year-old contest of the meeting. We have already noticed the Biennial of the Tuesday, in which Sir Charles had beaten Angelina. This pair was to run again in The New Stakes, and among other opponents they were to meet Tristan, a colt which had beaten Angelina in the Breeders' Plate at Newmarket. He had already won four races this spring, and he was now made a strong first favourite. In the actual race, the previous running of Tristan and Angelina was proved to have been pretty accurate: but Sir Charles turned out to be the best of the trio, as he won by three-quarters of a length. He had seemed to be beaten as they were running in, but he struggled on in a very game and courageous manner. So far, he has performed better than any other two-year-old this season, and he is engaged in the Derby, the St. Leger, and the Grand Prix de Paris of next year. He is a powerful colt, and when he gallops has remarkably fine action with his quarters and hind legs, bringing the latter forward in the manner which is so characteristic of first-rate racehorses. So far, he is the best public performer of the season among the two-year-olds, and he has already been backed for next year's Derby at 10 to 1 to win 6,000*l*. Only Isonomy, Chippendale, and Zut came out for the Ascot Cup, and Isonomy was made a tremendous favourite. He had won this race last year, as well as the Goodwood Cup and four other races, and he had won the Cambridgeshire the season before; but his last great performance had been in the Manchester Cup, a race which is rapidly increasing in importance. It is said that on the late occasion it was the most valuable handicap ever contested, and there had been a great deal of very heavy betting on the race. Twenty-one horses started; but, although Isonomy was carrying the crushing weight of 9 st. 12 lbs., he was victorious. Chippendale had already shown himself to be in excellent form this week, and Zut has grown into a very powerful horse. Chippendale is a very wiry light-fleshed horse, with enough bone, a plainish head, and a great deal of breeding; Isonomy is strong and compact, and so well formed that no honest critic could find a fault with him, although he is not what ladies call a pretty horse; and Zut is particularly strong, though somewhat heavy. Chippendale made the running, and kept the lead until approaching the grand stand, when Isonomy passed him, and won the race tolerably easily by a length. Zut ran well, all things considered, as he was only two or three lengths behind. The All Aged Stakes was won in a canter by Valentino, the least fancied of all the three starters. He had run earlier in the afternoon, when he was second to Elizabeth. Although he does not show any extraordinary amount of quality, he is very long in front of the saddle. Rayon d'Or had no difficulty in winning the Rous Memorial Stakes. The enormous Thunderstone was second. At first sight one imagines that this big beast could carry 16 st. to hounds, but at a second glance one wonders how he can manage to carry himself. The Viridis colt, which ran third, cost the respectable sum of 2,100 guineas as a yearling, but he has not yet won a race. The last race of the day, the St. James's Palace Stakes, appeared to be the greatest certainty of the whole week. The Derby winner, Bend Or, was to be opposed by what was considered a field of very moderate quality, and 3 to 1 was laid on his chance. He won his race, but not until his backers had received a good fright; for Fernandez, who had been nowhere in the Derby, ran within a head of him, after a very hard race, to the very great astonishment of all concerned. About 20 to 1 might have been obtained about Fernandez before the race, but it would have been well to have remembered that he had won the Craven Stakes very handsomely in the early spring, and that he is own brother to Isonomy. Handicappers are likely to remember him for the future.

There was an interesting race on the Friday for a Triennial, between Zealot and Muncaster. Half-a-dozen other horses ran, but 20 to 1 was offered against either of them, while only 5 to 4 was laid against each of the first-named pair. Muncaster had 7 lbs. the best of the weights, but his jockey was riding for the first time in public. From the distance, it was as good a race as ever was seen, and Muncaster just managed to win by a head, the nearest of the rest of the field being a couple of lengths away. Twenty-three horses ran for the Wokingham Stakes, which was won by Captain Machell's Warrior. Then came the Alexandra Plate, for which Thurio was the favourite. This horse was known to be in great form this season, as he had already won five races, including a walk over. The race for the Alexandra Plate, however, did not turn out such a certainty as was expected, for Ruperra, against whom 20 to 1 was laid, ran Thurio to a head. If backers congratulated themselves on just escaping disaster in the Alexandra Plate, they paid dearly for it in the Hardwicke Stakes, which immediately followed. For this race they laid 2 to 1 with

great confidence upon Rayon d'Or, who ran in a very currish manner when challenged by Exeter, and lost the race by a head. Capuchin, who had won the second race of the meeting, won also the last race but one. Charibert maintained his reputation for speed over short courses by beating Phénix in a canter for the Queen's Stand Plate. 32,380*l.* had now been run for during the week, and a rather indifferent Ascot meeting was brought to a close. The racing, except on the Friday, had been moderate; there had been no royal procession; there had been mourning in the royal enclosure and mourning among backers, and there had been one wet day.

REVIEWS.

HIGDEN'S POLYCHRONICON.*

THE elaborate work by Ranulf Higden of Chester, of which seven volumes have now appeared under the editorship, first of Professor Babington, and then of Dr. Lumby, cannot be rated high as an historical authority, at any rate for the period comprised in them. But its indirect value is great. It shows us the extent of the geographical and historical knowledge possessed by an intelligent and well-instructed man in the days of Edward III., and what manner of mental food was consumed by readers of the fourteenth and fifteenth centuries, during which the *Polychronicon* attained to a high degree of popularity. About twenty-four years after Higden's death, John Trevisa, Vicar of Berkeley and Canon of Westbury, translated it into English for the benefit of his patron Lord Berkeley; and at some time between 1432 and 1450 another English version was made by an unknown hand. It is not wonderful that the *Polychronicon* should have been popular. It contained a great deal of information, some of it of a rather apocryphal character, about foreign countries; and it gave a connected account of English history which, if not always satisfactory to our modern views, is at any rate eminently readable, except indeed for being conveyed in what Lord Berkeley and his chaplain Trevisa seem to have found very tough Latin—a fault which translators could remedy—and it interspersed the narrative with a sufficient number of pleasing marvels and miracles. Altogether, a gentleman who had mastered the *Polychronicon* would possess a large stock of general information, and a fair provision of edifying or exciting stories, such as would help to solace the enforced leisure of knights and squires in the dreary winter days when

> we can neither hunt, nor ride
> A foray on the Scottish side.

Higden moreover, though a compiler, is not altogether an uncritical one. He names his authorities; he sometimes gives two versions of events side by side, or corrects an error. He even compares two stories as to the death of Edmund Ironside, and gives the preference to one which—we quote from Trevisa's translation—"sekerly semeþ like sooþ." He points out that the legend which represents Eadric Streona as murdering Eadmund with intent to do the rival King Cnut a pleasure, and as being rewarded by immediate execution according to the precedent set by David with regard to the slayer of Saul, is irreconcilable with the statement, "quod communes chronicæ tradunt," that Cnut, after his rival's death, gave Mercia to Eadric, and acted on many important occasions by his advice, "quod profocto stare non posset si Edricum prius excapitasset." This exercise of the critical faculty seems to have been thought somewhat audacious and irreverent, as in one of the English versions a note, attributed to Trevisa, is added, to show how the stories might be reconciled, and no imputation cast upon the veracity or accuracy of historians. For the comfort of our readers we modernize the spelling:—

> It might well stand that Canutus . . . took counsel of Edricus ere Edricus wist that a should die, and did when Edricus was dead as Edricus had ycounselled while a was alive, and so the stories might stand, and none withsay other, and so it is more seemly than [to] say that writers of stories be false.

We see that historical criticism is not so modern an art as we sometimes suppose.

The volume before us begins and ends with what the newspapers call "obituary notices." At the outset we have the death of Oda, Archbishop of Canterbury; at the end, that of one Johannes de Temporibus, or "John of Tymes," as the fifteenth-century translator Anglicizes him. In or about the year when King Stephen besieged Oxford—*i.e.*, about 1142—"Johannes de Temporibus, qui vixerat trescentis sexaginta uno annis et armiger magni Karoli extiterat, obiit." That winter, we know, was a bitter one—every child's history tells how the Empress Matilda, all clad in white, passed unseen out of the beleaguered city of Oxford, and over the frozen Thames—and no doubt it carried off that ancient man, John of Times. Still one feels incredulous about the antediluvian length of days ascribed to this worthy. Life, at least among the laity, was as a rule so short in the Middle Ages that any man who managed to survive threescore seems to have been at once credited with some remarkable number of years. Thus the elder Hugh le Despenser, whom an examination of dates shows to have been really only sixty-four when he was hanged, is commonly spoken of as a nonagenarian. The exaggeration must of course be much greater in the case of John de Temporibus; and we shall not perhaps be far wrong if we guess him to have been a centenarian, whose age was more than tripled by the popular imagination, so as to throw his youth back into the misty and romantic days of Charles the Great. It is unfortunate that Higden gives no hint of his nationality, whether German or French, or of the place of his death.

John of Times has led us away from the editor's introduction, which by rights we should have considered first. Dr. Lumby's introduction to this volume is, however, little more than a useful summary of the contents, with critical notes to supplement or correct Higden's narrative. Professor Babington has already told us all that is known of Higden and his translators, and a compilation such as the *Polychronicon* does not require an elaborate preface to every successive volume. We wonder, however, that Dr. Lumby should have made no comment upon the interesting fact that Higden gives the story of the Ætheling William having threatened to yoke Englishmen to the plough like oxen, and cites as his authority "Willelmus," presumably of Malmesbury. "Insuper et ille Willelmus regis primogenitus palam comminatus fuerat Anglis quod, si aliquando dominium super eos acciperet, quasi boves ad aratrum trahere [eos] faceret." The editor merely adds a footnote to say that this is "not found in Willelmus." It will be remembered that the same story occurs in the so-called Bromton's Chronicle, and that the same authority is cited, though in no known copy of William of Malmesbury can it be found. Mr. Freeman has rejected the story, both as being improbable in itself and as resting on no good authority; but its occurrence in Higden, a careful and laborious compiler, who evidently wrote with William of Malmesbury at his elbow, somewhat strengthens the evidence in favour of its authenticity.

We think, too, that Dr. Lumby might with advantage have distinguished more clearly between what is peculiar to Higden and what we already know from other authorities. Thus the editor, speaking of King Eadgar, says:—"There can be no doubt that there must have been many good qualities in a monarch who, with so much said against him, found some one to write an epitaph such as is preserved on p. 22." From the expression "preserved," one would expect to find something peculiar to Higden; whereas the epitaph, as Dr. Lumby himself points out, is quoted from Henry of Huntingdon. So, a few lines further down, we read:—"The fall of the floor of the house where Dunstan was presiding at the Council of Calne is called by Higden a miracle, though perhaps it was only an accident." But Higden was simply copying from William of Malmesbury, who both in his *Gesta Regum* and his *Vita S. Dunstani* applies the term *miraculum* to this event. In the same page Dr. Lumby, we think, slightly improves upon a statement of his author. "It is interesting," he remarks, "to note that the old name of the district now known as Harewood in Yorkshire was Warewell or Werwell." Now when we turn to Higden we do not find, any more than in his authority, William of Malmesbury, any mention of Yorkshire. The words are simply "in silva de Warewelle, quæ Harewode dicitur." Trevisa introduces the idea of one being an older name than the other—"þe wode of Werwelle, þat *now* hatte Horwode"—but even he does not name the shire. As far as Higden's words go, they might equally be cited to prove that there was once a Harewood near Wherwell in Hampshire—a more likely locality for the hunting of a West-Saxon king. The wood, wherever it was, is made the scene of the mythical murder of Æthelwald for his fair wife's sake. Mr. Freeman has gone laboriously into the different versions of this story, pointing out that, while William of Malmesbury lays the scene at "Warewelle," with the addition (in one MS. only) "quæ vocatur Harewode," Gaimar places it at some nameless locality on the road from Sarum to York. This no doubt gives a colour to the theory that Harewood in Yorkshire was meant; but, as the story stands in William and in his copyist Higden, there is not a hint of the journey to York, which forms an important part of the Gaimar legend. In one of the editor's notes we also find a remark which we think requires some modification. Contesting the conjectural derivation of *Clito* from κλειτός, he observes:—"So little was known of Greek at the time when this title was most common that the derivation appears doubtful." Now into the question whether the derivation be good or bad we will not enter, but assuredly the mediæval writers were not so ignorant of Greek words as to give this particular objection any weight. Dr. Lumby must have forgotten the title of Basileus used by the English Kings, that of Diarcha (δυάρχης) assigned by Osbern to Eadgar, in the days when he reigned simultaneously with his brother Eadwig, and the frequent interpolation of Greek words, used apparently only to display learning, in the Latin of mediæval writers such as Orderic. On this subject we need only refer him to the Glossary in the *Memorials of S. Dunstan*, and to Canon Stubbs's interesting remarks in the preface. However little real knowledge of the Greek language there may have been, still when we find *oroma* (ὅραμα), *pneuma*, *bratthea* (βραχέα), *cauma*, *perieryia*, *entole*, *aporia*, *stem-*

* *Polychronicon Ranulphi Higden Monachi Cestrensis; together with the English Translations of John Trevisa and of an Unknown Writer of the Fifteenth Century.* Edited by Rev. Joseph Rawson Lumby, D.D., Norrisian Professor of Divinity, Vicar of St. Edward's, Cambridge, Fellow of St. Catharine's College, and late Fellow of Magdalen College, Cambridge. Vol. VII. Published by the Authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. London: Longmans & Co; Trübner & Co. Oxford: Parker & Co. Cambridge: Macmillan & Co. Edinburgh: A. & C. Black; Douglas & Foulis. Dublin: A. Thom. 1879.

mate doxa—and these do not exhaust the list—all introduced into one not very long *Epistola ad Eadgarum regem* from the monastery of S. Geneviève at Paris, we must admit that mediæval scholars were capable of making a considerable show of Greek words.

The value of this edition of Higden is much enhanced by the two translations interleaved with the Latin original. The student of philology has here the genuine text of Trevisa, not the comparatively modernized version printed by Caxton. Side by side with it, he has the anonymous translation of the fifteenth century, which has never before been printed. Interesting as this second version is in its way, there can be no hesitation in awarding the palm, both as a translation and as an English composition, to the older version. Professor Babington has indeed remarked somewhat severely upon Trevisa's deficiencies as a translator, but the present volume does not appear to contain many glaring faults; for the state of utter confusion in which we find the poetical epitaphs on Eadgar and Henry I. may be partly due to transcribers. It is possible, too, that there may be some omission in the statement that "Lanfrank . . . despisede þe smokynge and schillynge [*sic*] speche of mysbeleved men." The original has, "mundi fumos et ampullata gentilium eloquia." The whole passage shows how Trevisa was puzzled by a long, involved, and ornate sentence, and how he broke it up into short, direct, and disconnected phrases. When however we find in another passage "omnifcopia plenis effulsit cornibus" rendered as "everiche grove schoon wiþ horten treen and oþer tren ful of fruyt," we cannot but suspect that Trevisa did not understand his original, and therefore substituted something that he thought would make sense. But we will not undertake to criticize his translation, especially as, in his dialogue between himself and Lord Berkeley, he reveals a dread of carping critics, and has to be consoled by his patron with the reflection that "Clerks know well enough that no sinful man doth so well that he ne might do better, nor make so good a translation that it ne might be better." At any rate his English is racy and vigorous, and his occasional comments upon his author are so characteristic that one wishes there were more of them. Thus, upon Oda's becoming a monk, because all his predecessors in the Archbishopric had been monks, he observes:—

> Odo was lewdliche [*i.e.* ignorantly] i-meoved þerfore to make hym a monk, ffor Crist, ne non of alle his postles, was nevere monk nor frere.

The same anticipation of Protestantism may be traced in his remark, with his somewhat sour prayer, on the death of Patricius or Paternus, the monk of Cologne, who, refusing to leave his burning monastery, "zelo martyrii combustus est":—

> In þat doynge Paternus the monk semeþ a lewed goost, þat kouþe not knowe þe cause and þe circumstaunce of verray martirdom; for þere is no verrey matirdom bot it be by meyntenynge of truþe and wiþstondynge of wrong and of synne. Bote God graunte, ȝif it is in his wille, þat Paternus be nouȝt i-dampned for his blynde devocioun.

When, in the account of the battle of Lincoln, he comes to the jingling description, taken from Henry of Huntingdon, of one of the Earls on King Stephen's side, as "Baccho devotus, Marti ignotus, vino redolens, bello insolens," Trevisa displays his classical lore:—

> Poetes feyneþ a god of wyn, and clepeþ hym Bachus, and anoþer of bataile, and clepeþ hym Mars; and so for þe speche . . . . he þat is nouȝt worþ in batayle is unknowen to Mars.

Higden is mistaken in applying this description to the Earl of Albemarle. In Henry of Huntingdon it belongs to a "consul," who, as Mr. Freeman observes, "seems to have been too disreputable to be named," and whom Canon Stubbs supposes to have been the Earl of Warren.

The later and anonymous translator has prudently left all pieces of poetry in their original obscurity, and must either have worked from an abridged copy, or else have unblushingly omitted whatever he found too hard. He gives no glosses, and writes in a Latinized jargon which Professor Babington thinks can hardly represent spoken English of any period. His philological value therefore is far below that of Trevisa, but by sticking closely to the Latin he sometimes—not always—succeeds in being more accurate than his less servile predecessor. One little touch helps us to the conjecture that he was an Oxford man. Higden writes:—"Mortuo Canuto facta est *apud Oxoniam* magna altercatio de regni successione." The anonymous translator renders this:—"Canutus the kyng dedde, egrote altercacion was hade for the succession at *the universitie of Oxenforde*." This looks like the interpolation of an Oxford student, anxious to exalt the antiquity of his University.

In an appendix we have a third translation of chapters xv.-xxvi. of Book VI., taken from a copy of Trevisa, but evidently the work of a later hand. It is from this that we have quoted the attempt to reconcile the discrepancies in the accounts of Eadric Streona. We must refer our readers to the preface for an explanation of the probable origin of this fragment, which in language seems to stand between the original Trevisa and the anonymous translator.

MEMORIALS OF HUGUENOT PERSECUTION.*

We recently had occasion, in reviewing two new Histories of the Huguenots, by an American and an English author respectively, to dwell on the fact that the decisive moments in the fate of French Protestantism are to be found in the period which preceded the actual Revocation of the Edict of Nantes. Not only may it be said with truth that few autocrats have ever had favourable an opportunity as Louis XIV. of making a nation great and prosperous by union, but, as Ranke has shown in a masterly chapter of his *French History*, there was a time when the King seemed very near to a recognition of the opportunity. But it passed by, like so many of those golden chances of peace and reconciliation which religious history records as hopelessly lost; and, doubtless partly owing to Huguenot rigidity, the Charenton Synod proved something worse than a failure. The King was exasperated by the collapse of his politic notions; and yet Protestant prisoners had afterwards to submit to be taunted with the fact that their ministers had not absolutely rejected the possibility of reunion. Meanwhile it is not surprising that the period in the history of French Protestantism which has impressed itself most powerfully upon the minds of natives as well as foreigners should be that in which persecution appears at its climax, and resistance in almost its last extreme of passive helplessness. The actual extreme was after that fierce flicker of the flame which is known as the Revolt of the Camisards. For the popular ear both these terrible passages of an Iliad of woes have once for all found their historical utterance. Literary genius has rarely given expression to more overwhelming charges than those which, in one of the best known parts of his great work, Michelet brings against the almost obsolete idol of his country's admiration—the age of Louis XIV. If at less length, he has certainly not narrated with less force the dreary fifth act of the tragedy, which was performed in the reign of that supposed good easy squire of dames, Louis XV. Who shall say how much the sarcasm and the pathos of the most brilliant of modern French historians has done towards confirming principles and hardening prejudices which the political conflict now in progress in France has made more manifest than ever? Michelet's robust conviction as to the diabolical nature of Jesuitism must no doubt be to many a sufficient reason for distrusting the spirit of his narrative. But one of his many resemblances to Mr. Carlyle lies in the respect which, imaginative as he is, he pays to his facts; and nowhere has he been more conscientious with regard to them than in his account of the religious persecutions of the seventeenth and eighteenth centuries. At the close of his thirteenth volume, after telling the awful story of the troubles which more immediately preceded and followed the Revocation, he takes care in a note to cite his authorities, which, as is well known, are remarkably numerous, and in part altogether beyond suspicion. And so again, when in a later volume he has to treat of those half-forgotten barbarities which more than complete the second century of Huguenot sufferings, he thinks it well to remind his readers that the "legends" to which he refers are only "too true." It is remarkable that, to the already abundant evidence which Michelet had at his command, the present year should have in two instances added fresh proofs of a startling directness; and that from both of these one of his most paradoxical assertions should have received strong confirmation. The two publications to which we desire now to direct attention certainly attest the twofold statement that among the French Protestants the women were the worst persecuted, and that they were notwithstanding, on the whole, the most courageous and the most enduring adherents of the prohibited faith. While one of these volumes contains the mutually corroborative experiences of two typical *confesseuses* of the Revocation period, to whom it was at least given to tell how they had suffered, the other brings to light a testimony, literally raked together out of the dust of the dungeon, concerning the tribulations of a later generation of Huguenot women.

Blanche Gamond, a native of Saint-Paul Trois-Châteaux (an episcopal city till the time of the Revolution), and Jeanne Terrasson of Die (likewise a town in Dauphiné) were both, at a date not much later than that of the Revocation of the Edict of Nantes, victims of one of the most cruel forms, and of probably the most cruel agent, of the persecutions. After having undergone imprisonment in the *basse-fosse* of a dungeon at Grenoble, without having been brought to abjure their faith, they were transferred to the hospital of Valence, then under the direction of "La Rapine," and commonly called—as indeed afterwards was at least one similarly managed institution—after his name. There is no reason to consider Michelet's general description of French hospitals in the seventeenth century exaggerated; they were doubtless very much like what English prisons were in the eighteenth. The Valence hospital, however, was regarded as exceptional even of its kind, on account of its speculative director, who, according to one witness, was wont to inquire, when desirous of intimidating his victims, "Do you make no account of the fact that in less than three years sixty persons have died in this establishment?" The Catholic orphans and others of whom he took charge had no reason to love him; but as regards the Protestant women who were consigned to his care in order that he might become their *convertisseur*, it was his deliberate design, and the design of those who gave them over to him, that the hospital should be a hell upon earth. To judge from the narratives of these two witnesses, Michelet has exaggerated little or nothing in his account of the character of Henri Guichard, *alias* the Sieur d'Hérapine, *alias* La Rapine *tout court*—probably the worst rascal as well as the most brutal gaoler of his time. In the end, notwithstanding the protection extended to him by the prelate who had established him at Valence (Daniel de Cosnac, Bishop of that

* *Deux Héroïnes de la Foi: Blanche Gamond, Jeanne Terrasson.* Récits du XVIIe siècle, publiés par Th. Claparède et Ed. Goty. Paris: Sandoz & Fischbacher. 1880.

La Tour de Constance et ses Prisonnières. Liste générale et documents inédits. Par Charles Sagnier. Paris: Sandoz & Fischbacher. 1880.

diocese, and afterwards Archbishop of Aix, whose hope it had once been to play a leading part in the reconciliation of England to Rome), he had to give up his post and stand his trial on a long series of charges; but his ultimate fate is unknown. As tyrants have always other tyrants, pettier but not less cruel, under them, so there was at Valence a "seconde Rapine, nommée Marie," a sister who filled the place of matron in the hospital. Her task in the way of conversion was to head the assaults of the Catholic upon the Protestant women with foul words and cruel blows. It is some satisfaction to learn that she, too, was at last overtaken by disgrace and dismissal.

The value of the narratives before us is, however, not confined to the accounts which they give of the details—often revolting, and always painful—of a peculiarly atrocious system of persecution. Blanche Gamond, who was taken prisoner when trying to leave the country in the company of her brother (who contrived to escape), is the more diffuse and elaborate of the two writers; her narrative of her own attempted escape from prison, to which she was dragged back more dead than alive, is as dramatic as that of her interview with her mother—who clearly had not held out like the heroic daughter—is full of pathos. In the end she was ransomed after about eighteen months' imprisonment, and made her way to Switzerland, where with her parents she subsisted on charity, first at Geneva and then at Bern. It was here that she drew up the narrative of the sufferings undergone by her when a young woman "of about twenty-one years," and certified (in 1696) to the narrative which Jeanne Terrasson had three years before written of her contemporaneous experiences in the *basses fosses* of Grenoble and at "La Rapine." The latter narrative had hitherto, unlike that of Blanche Gamond, which appeared in 1867 in the Transactions of a French Society, remained altogether unknown. Its writer, a married woman at the time of her imprisonment, had stood firm among the terrors of the *dragonnades* of 1685, when her husband's courage had given way. "Travêtie en homme," Jeanne, in whose narrative there is a certain simplicity which is wanting in that of Blanche, remained "in retreat," wandering from house to house at night-time even in the dead of winter, for the space of a whole year. Then, when notwithstanding the terrible penalties proclaimed against all who should dare to leave the country—for men the galleys, and for women to be shorn and to be imprisoned for life—she was attempting to escape, she too was taken near Grenoble, and consigned to her doom. The head-shaving the poor creature escaped by accident, and with a thankful heart:—"J'eus par là bien sujet de reconnaitre de plus en plus que nos ennemis ne peuvent pas nous ôter un cheveu de notre tête sans la permission de Dieu, qui lia les mains à ces miens ennemis, et fit qu'ils m'oublièrent parmi toutes les autres qui furent rasées." All the other cruelties and indignities native to the place, including blows and buffets, vermin, filth, starvation, useless labour and *Sunday* labour, she had to undergo. Her husband's visits, encouraged by La Rapine so long as he thought they might contribute to her conversion, were succeeded by the news of his death; and in addition to the horrors of the present there was the fear of an even more terrible future—the threat of that deportation to America which the persecuted Protestants feared more than perpetual imprisonment, in some instances more even than death, at home. Like Blanche Gamond, she made an unsuccessful attempt to escape, and, like her, was at last released by the Royal decree which permitted the ransoming of unconverted prisoners. She, too, found a refuge in hospitable Geneva, and afterwards at Bern. Two of her sisters, she writes, had likewise reached those "happy regions"; a third was still lingering in France, chiefly because she was unable to take her children with her.

What, perhaps, is most striking in these memoirs is the apparent impossibility to their writers of discovering any common point of contact between the views of a *confesseuse* and those of a *convertisseur*. Neither of them is a woman of superior intellect; Blanche Gamond, in particular, seems to apply no reasonable measure of comparison even to her sufferings, and complains of the lack of bouillon or of the inopportune offer of an egg in much the same strain in which she resents barbarous inhumanities. But both she and Jeanne Terrasson are up to a certain point skilful controversialists as well as ardent enthusiasts; there they stop, resorting to vituperative invective which explains, if it does not excuse, some of the sufferings inflicted upon them. On the other hand, the converting zeal of their captors and gaolers, of the prison priests, of the prison surgeon, even of their more liberal-minded friends, seems all on the same level, mixing up certainty as to the truth of the Roman Catholic faith in the naïvest fashion with a conviction of the expediency of adopting it. In the end the conflict reduces itself to one between force and stubbornness; the former succeeds in pushing the *confesseuse* into the "temple des idoles"; the latter persists in regarding these forced attendances as "le plus grand péché que j'aye commis en ma vie." Such interiors of the seventeenth century open to us a moral and intellectual world to which our eyes have grown strange.

But what is to be said of another interior which maintained itself in France several years beyond the middle of the eighteenth century? Near Aigues Mortes, a few miles from Nîmes—the city which gave birth to a Protestant French Prime Minister, and where, we believe, to this day it is thought hazardous to put Meyerbeer's *Huguenots* upon the stage—stands, as some of our readers may remember, a round tower, said to have been begun by St. Louis and finished by Philip the Bold. This tower long served for the confinement of Protestant prisoners, but after the escape thence of the Camisard Abraham Mazel, with sixteen companions, it was only employed for the confinement of less dangerous convicts—women arrested for having attended "religious assemblies." It was not till the year 1767—just twenty-six years after the young King Frederick II. of Prussia had, probably under the inspiration of Voltaire, requested from Louis XV. the liberation of the religious prisoners in the Tower—that the Marshal Prince de Beauvau, on the occasion of a journey of military inspection, obtained permission to release three or four of the incarcerated women, and took the liberty, in the name of justice and humanity, to liberate all that remained, fourteen in number. We now learn from M. Sagnier, whose researches enable him to give a yearly list of the females confined in the Tower, that the earliest known of these imprisonments dates as far back as 1708. In 1746, four years after King Frederick had made his appeal, there were forty prisoners in the Tower; and, in 1750, when an active raid was made upon the Protestant assemblies in Lower Languedoc, a fresh batch was added. A few years earlier we find an instance of an old woman, of the age of seventy-seven, being placed there. In her case small hope of conversion can have been entertained. But in no instance was any release granted till after a declaration of abjuration had been signed—a significant comment upon the sophism with which the Intendant of Languedoc had replied to the communication of the King of Prussia's request. "You are aware," he writes, unconsciously repeating Lord Burghley's defence of Queen Elizabeth's persecution of the Catholics, "that the real crime for which the prisoners are punished was that of having 'gone counter to the ordinance of the King.'"

It is of some of these "political" prisoners that a series of memorials have recently come to light, more touching in their mute appeal than all the biblical eloquence of Blanche Gamond or the psalmody of the minister's sister, Jeanne Terrasson. During the clearing away last August of a quantity of obstructions from the loopholes of the great room in the Tower which served as the prison-in-chief, "great was the surprise" of the officer who had directed it to find among the rubbish a piece of ancient coarse cloth matting, from out of which he drew forth two women's shoes, one of a young girl, three children's shoes of different sizes, some playing-cards, conjectured to have belonged to the soldiers on guard, "a pewter spoon, some potsherds, and some fragments of letters." Owing to the accident of their being covered by the thick matting, all these articles had been preserved notwithstanding wind and weather. The fragments of letters are now printed. They are only four in number. Three are written or dictated by a husband to the address of his wife in the Tower, in the years 1730 and 1731. He prays for her day and night; and he is intriguing to the best of his ability to bring about her release. She has, by M. Sagnier's researches, been identified as a daughter of most respectable parents, and the wife of a most respectable husband, at Nîmes. She had been baptized a Catholic, but her family had remained true to its Protestant traditions; and so, though the mother of four children of whom the youngest was a baby of a few months, she had gone to listen to a sermon delivered to the faithful in the Mas des Crottes near the city. The assembly was surprised; and her fate was to have her head shaved and to be imprisoned in the Tower. Twelve years and seven months afterwards, having abjured the errors of Calvin, she was released. The fourth fragment is dated 1730, and is written by a mother-in-law to her son's wife, who had given birth to a child in the Tower. The mother-in-law sends with her congratulations and prayers some linen, and a bench and a board for a bed. The young wife, who had been taken during her pregnancy in the Mas des Crottes, has been identified as belonging to a well-to-do family of Protestant antecedents; but she had been married to her husband, a master-miller, according to the Catholic rites. She remained in prison for twelve years and six months, at the end of which she too abjured the errors of Luther and Calvin. Though the Tour de Constance has yielded only a few and simple secrets, yet the history of its sorrows may, like these poor letters themselves, be sufficiently reconstructed from fragments to remind us of its gloomy significance.

HODGE AND HIS MASTERS.*

WHY should an agricultural labourer be called, generically, "Hodge"? There is good reason for calling a sailor "Jack"; it is as likely as not to be his actual, if not his baptismal, name; but if any one has ever known, seen, or heard of a man on a farm who answered to the name of Hodge, his experience is more extensive than our own. The word is, or is supposed to be, an abbreviation of "Roger," than which no ordinary Christian name is less familiar in the agricultural districts. Probably the nickname is taken as representing, both in type and sound, the ideal labourer as he is exhibited by contemporary art; an unlovely combination of a pig and a scarecrow, vacuous and grinning in the earlier stages of his life, haggard and hideous as he falls to pieces at last. It is perhaps by an excusable concession to the popular taste for caricature, and along that Mr. Jefferies has

* *Hodge and his Masters.* By Richard Jefferies, Author of "The Gamekeeper at Home," &c. 2 vols. London: Smith, Elder, & Co. 1880.

adopted this stupid designation in the title of his book; but, if he chooses thus to provoke a prejudice against him on the part of reviewers whom his former works had certainly predisposed in his favour, it is entirely his own fault. We are bound, however, to add that he has done his best, and that very well, to teach the town-bred readers of the *Standard*, through the papers now collected in these volumes, who and what the "Hodge" of their satire is in actual life. He is commonly supposed, we are aware, to belong to the general class of "unskilled labourers." The correctness of the assumption can easily be tested by any one who will watch him laying a hedge, or trimming one, and will then ask his leave to take a turn for a yard or two at the same work, by way of experiment. Or he is imagined to be clumsy and shambling, with no particular control over his arms and legs. It happens that just now there has been a fair average fall—perhaps rather above the average—of oak timber going on; and it would be easy to put on the climbing irons, and try a match with Hodge the younger as he goes up to fasten the rope. Only it might be desirable to test the irons first; because, in the event of a breakage at twenty feet up, it might not be so easy for the critical amateur to fall straight, and be ready, after nothing worse than a fortnight or so of sprained ankle, to try another tree before the felling was over.

Mr. Jefferies's book appears very opportunely at a time when it is especially necessary to clear away the mass of nonsense which has been talked and written about "Hodge" and his fellows. Lord Henry Sydney—or was it Lord Valentine?—fought valiantly, but vainly, in our early youth to secure for them official recognition as the "peasantry," and was fain after all to write down "labourers" in the place of the nobler title. So therefore must we; but as the "labourer" bids fair to become what the "peasant" never was, one of Lord Sherbrooke's "masters," it is time that the public should educate itself about him, besides proceeding (with or without by-laws) in the work of educating him. *Hodge and his Masters* is a valuable contribution to the practical literature of country life. On the whole, this series of papers may be described as including all the varieties of work and circumstance which are exhibited under the general designation of farming. That any such variety exists may be a revelation to some persons, who imagine a "farmer" to be very much the same sort of person, with very much the same work to do, whether he lives in Lincolnshire or on Salisbury Plain; whether he grows cabbages on the Essex Flats, hops and cider in Herefordshire, or nothing at all on a heavy clay soil during the late melancholy series of wet seasons. To the large class of professional and business men whose escape from London is limited to a few weeks at the same recurring season, usually in August or September, the variety of Mr. Jefferies's descriptions will make his book very pleasant reading. They are perhaps familiar with harvest-time and the inland and sea-side aspects of the later summer, while they have not seen the apple-blossom or gathered a strawberry for thirty years. Nor will country readers themselves find very much less to learn. It is not a paradox to say that a thorough rustic, whether master or man, knows very little of the country. He knows his own country, it is true; his tether is a little longer and a little more flexible than that of the season-ticket holder in his shuttle-like passage from office to villa and back; but outside the ways of his own neighbourhood he has no experience. He is not, indeed, as utterly *adscriptus glebæ* as was his grandfather, who never in his life was further from home than the county town, when he was summoned as a juryman or witness to the Assizes; but the change is very gradual, and his more erratic movements are governed by the excursion train.

The labourer's "masters," in the sense in which Mr. Jefferies uses the term, represent the whole order of the country life in which he works for his wages. His immediate employer, the tenant-farmer, of course fills the largest space in the picture; but the peer, the squire, the parson, the banker, lawyer, and editor—though, unless the oversight is our own, by a singular omission, not the doctor—have all their places in the hierarchy by which the life of "Hodge" is ruled. These sketches are of varying merit; but we have marked the paper headed "County Court Day" as one drawn with especial vigour and effect. It is perhaps only fair to state that the author has written generally with attention to accuracy in details; though the admission is more than he deserves at the hands of his critics when he deliberately chooses to scandalize them in his very first line:—"The doorway of the Jason Inn at Woolbury." What farmer, in or out of "the Farmers' Parliament," ever heard of such a sign, or would have the faintest notion of what the writer could have got into his head? The Dissenting minister, if he were consulted, might possibly rub up his traditions of Puritan signs, and suggest a solution which, however unlikely, would not be absurd and impossible. We have a dim idea that there is an advertising hosier somewhere who calls his shop "The Golden Fleece"; but he at any rate exhibits his classical learning in plain English. We must also take objection, as being not merely "exceptional," but exaggerated and unreal, to the sketch of "Mademoiselle." The daughter of the homely, rough country farmer may have been brought up to think herself a "lady"; she may have gone out as a governess; she may have lived as such "at the West End"; she may have worn very fine clothes, and travelled with a first-class ticket, and have "seen very grand people indeed occasionally," in Belgravia, or its suburbs; and she may have come home to ask her father for money, and to give herself airs. But the picture presented to us, as a whole, is patchwork. It is not socially true; and, instead of a contrast, the author has given us a contradiction. A girl of refined mind may rise above her original surroundings; but this girl is not refined, and in real life she must have been either less good or less "grand" than Mr. Jefferies has made her.

Among Hodge's masters, the tenant-farmers, we are introduced to a large and diversified collection of portraits, taken, it may be presumed, more or less from life. The men are as various as the scenes in which their lot is cast, and the old order, as usual, is shown as giving place to the new. But one type of farmer will be searched for among his fellows in vain—that is, if anybody thinks it worth while to undertake the vain labour of searching for him. This is the "John Bull" of whose being we suppose that in the present generation Mr. Tenniel must be regarded as the author, and who may possibly once have existed otherwise than as the phantom which he is now. However this may be, the character and position of the occupier of land, always somewhat undefined, is now passing through an evident stage of transition. He is, and he is not, an independent trader. He does what he likes with his own, but what is his own may not be so easy to discover. He has been a good deal worried by Commissioners of various kinds for the last half-century, and the result has left him in a generally unsettled state of mind. Formerly, the custom of leases for lives, and the number, in some parts of the country, of small freeholds had established a constant element in the farming class, which has been largely uprooted by the modern system of yearly agreements and the formation of purchased estates. The tenant at will is now almost as movable as his machinery, and the "parishioner" as an institution bids fair to be speedily extinct. Whether the farmer is or is not in his nature a Conservative is a political mystery which lies outside our province as literary reviewers. He is supposed to be a Churchman, but we believe that his Churchmanship has not generally reached the level of a voluntary Church rate, and perhaps might require some education if advancing legislative ingenuity should ever hit upon the analogous invention of a voluntary tithe. Such as he actually is now, Mr. Jefferies has carefully and often amusingly shown us from many different points of view.

The concluding chapter of *Hodge and his Masters* is among the best bits in the book; and, by a happy dramatic device, brings all the actors in the play at once before the audience at the fall of the curtain. "Hodge's Last Masters" are the Board of Guardians; and this authority, in its combined *ex officio* and elected elements, includes the peer, the squire, the parson, the farmer, and the townsman. The Board has met; and

> the master of the workhouse delivers his weekly report. One inmate, an ancient labourer, died that morning in the infirmary. The announcement is received with regretful exclamations, and there is a cessation of business for a few minutes. Some of the old farmers who knew the deceased recount their connexion with him, and how his family has lived in the parish as cottagers from time immemorial. A reminiscence of a grim joke that fell out forty years before, and of which the deceased was the butt, causes a grave smile, and then to business again.

Mr. Jefferies knows too well the value of the "infirmary" to the aged labourer to represent it as in any way a grievance or wrong that he should, as a rule, end his days there. But he knows also—and in a passage too long for quotation, which we commend to the attention of his readers, he has admirably described—the old man's reluctance to leave his home, and the reasons which go far to justify it. He has certainly put an extreme case; and, in order to account for the aged labourer's solitary life in the cottage, he is obliged to describe him as entirely or in part the owner of it. This is, of course, the exception; he would be more usually "taken care of" in a well-filled, if not crowded, dwelling; and the cottage of poetry and sentiment, with its thatch and its woodbine, is not, as the author is careful to show, the ideal of sanitary reformers. He must "go into the House":—

> At the workhouse the monotony weighed upon him. He used to think as he lay awake in bed that in the spring nothing should keep him in this place. He would take his discharge and go out, and borrow a hoe from somebody, and go and do a bit of work again, and be about in the fields. But the spring came, and the rain was ceaseless.

The year went by, and he became more feeble:—

> In the infirmary the real benefit of the workhouse reached him. The food, the little luxuries, the attention, were far superior to anything he could possibly have had at home. But still it was not home. . . . The end came very slowly; he ceased to exist by imperceptible degrees, like an oak-tree. . . . Hodge died; and the very gravedigger grumbled as he delved through the earth hard-bound in the iron frost, for it jarred his hand and might break his spade. The low mound will soon be level, and the place of his burial shall not be known.

The concluding pages of *Hodge and his Masters*, from which these extracts are made, recall to us, in not unfavourable comparison, Faber's poem on the "Death of the Agricultural Labourer"; and this, as those who know the poem will acknowledge, is no slight praise.

RENOUF'S HIBBERT LECTURES.*

THE trustees of the Hibbert fund have no reason to regret the adoption of the advice that some portion of the resources at their disposal should be devoted to courses of lectures on the historical religions of the world. Nor can there be much doubt that no wiser decision could have been made than that which selected the ancient religions of India and Egypt for examination

* *The Hibbert Lectures, 1879.—Lectures on the Origin and Growth of Religion, as Illustrated by the Religion of Ancient Egypt.* By P. Le Page Renouf. London: Williams & Norgate. 1880.

at the outset of the task thus taken in hand. But, in spite of the feelings of wonder and curiosity which the Nile Valley and its people can never fail to awaken in all who are not destitute of the historical faculty, the lecturer who undertakes to deal with the civilization and religion of that mysterious land is placed in some measure at a disadvantage. The history of thought and belief among the Aryans of India is inextricably bound up with the history of thought and belief among the Aryans of Europe. Both belong to the same stock; the languages of both are closely allied; and both carried the germs, and perhaps more than the germs, of their civil polity, their ethics, and their religious faith from the common home of the race. We find among the former not only the names of gods worshipped by the latter, but the framework of the multitude of popular traditions which have had their fruit in the great harvest of Eastern and Western epic poetry. Professor Max Müller might well say that, as offering opportunities for a real study of the genesis and growth of religion, no country can be compared to India, and that the sacred books of the Hindus furnish for a study of religion in general the same peculiar and unexpected advantages which the language of India has offered for the study of the origin and growth of human speech. When we turn to Egypt we are tempted to fancy ourselves in a region altogether isolated from any other, and more especially in one which has as little influenced the Aryan world as the influence of the latter seems to have been felt within its borders. It is scarcely possible, therefore, that the history of Egyptian thought and belief can have the charm and the absorbing interest which one feels in tracing the development of religion among tribes whose ancestors belong to the same stock with our own, unless indeed it should throw light on problems of which, so long as our view is confined to an Aryan horizon, we can make little or nothing.

But, however wide may be the gulf which separates the people of ancient Egypt from the Aryan world in times for which we possess records or traditions of any kind, the character of their religion remains a subject of paramount importance in the history of human thought; and, after all, as the scrutiny is carried further and further, the question may again be forced upon us whether this isolated nation may not have some distant kindred with Hindus, Greeks, and Teutons. The existence of any connexion between them in times of which we can be said to have the least historical knowledge Mr. Renouf emphatically denies. The days of Egyptian greatness were over before the country was opened to Greek merchants; but, although traders are not likely to be specially susceptible of intellectual and religious impressions, the intercourse of these strangers with the Egyptians could not be wholly without result. Mr. Renouf's assertion that neither Greeks nor Hebrews borrowed any of their ideas from Egypt may be over-confident; but he may perhaps be justified in speaking of the travels of Pythagoras and other philosophers to Eastern climes as "fabulous inventions," and in regarding as absurd the notion that Greeks would listen to a foreign teacher as the author of doctrines which they would certainly have discovered without his help and at the very time they did so. The idea that Alexandria ever served "as a medium of interchange of ideas between the Eastern and Western worlds" he treats as not less untenable. It was, he says, a commercial town, inhabited by a population which cared not in the least for Eastern ideas, while the learned Greeks who lived there were profoundly ignorant of the Egyptian language and literature; and not only is the information which they give us for the most part utterly erroneous, even when it has been derived from an authentic source, but it is always completely Hellenized in passing through a Greek channel. Nor can more be said for the notion that Alexandria was on the chief line of traffic between Europe and Asia, the trade with the more distant East being in the hands of the seafaring Arabs of the Persian Gulf, the Gulf of Oman, and the Gulf of Akaba. If, however, the idea of any extensive intercourse between Egyptians and Europeans in historical times must be given up, the fact still remains that the course of Egyptian thought runs on the whole parallel to that of the Aryan tribes in India, and exhibits some striking points of resemblance and agreement. The vast antiquity of Egyptian civilization carries us back to an age compared with which the era of the Aryan invasion of the Punjab is modern; but, after all, we can say nothing as to the length of time during which the common ancestors of the Aryan nations lived together in their primeval home. Whether the Egyptians belonged to the same stock is a question which must be decided on evidence or left undetermined. The evidence at present at our command leaves it open. The theory that they came from Ethiopia and moved steadily towards the North has been abandoned. Their southward migration, Mr. Renouf asserts, has been "most conclusively proved"; and the earliest Ethiopian civilization is "demonstrably the child, not the parent, of the Egyptian." A growing consensus of scholars points "to the interior of Asia as the cradle" of the race, which beyond doubt is wholly distinct from all genuine African tribes. Mr. Renouf refers to the assertion of Professor Owen that the conditions which could bring about the conversion of the Australian into the Egyptian type of skull are unknown and scarcely conceivable, and that, in the earliest as in the later Egyptians, "the size of crown and multiplication of fangs are reduced in the ancient Egyptian to the standard of Indo-European, or so-called highly-civilized races." From their language we can infer nothing beyond the fact that, if we rely on their testimony, the Egyptians had no affinity with the Semitic family of mankind. Their speech "is not, or at least cannot be shown to be, allied to any other known language than its descendant the Coptic." The existence of caste as an immutable condition would, if the fact were certain, in no way militate against their Aryan origin; while their retention of monogamy in a continent where among other races it was unknown tells more strongly in its favour than their adoption of it would have justified an opposite conclusion. Caste, however, in the Hindu sense of the word, was not an Egyptian institution. There was no impassable barrier between professions, while the position of the mother in ancient Egyptian families is "absolutely irreconcilable with the existence either of polygamy as a general practice, or of such an institution as the *harêm*."

At this point, then, we must, it seems, leave the question of their affinity with any European or Asiatic nations; but perhaps for this very reason the history of their civilization, and still more of their religion, becomes both more instructive and more important. If its origin and growth were independent, it illustrates still more forcibly the course into which by their constitution the men the thoughts of men are directed; and the greater its antiquity the more cogent are the conclusions to be drawn from it. The two facts which our examination of this history brings out in strong relief are the extremely early development of a belief which may fairly be called monotheistic, and the gradual expansion of a mythology which runs parallel with that of the Aryan races. In other words, the analysis of ancient Egyptian belief completely upsets the theory of De Brosses, which Professor Max Müller had in the first series of Hibbert Lectures shown to be untenable—namely, that all religion had its beginning in Fetishism; while the examination of Egyptian myths adds vastly to the strength of the conclusions reached by comparative mythologists who have worked in the wide field of Aryan tradition. To these two points Mr. Renouf addresses himself specially throughout these lectures; and if we admit the truthfulness of the picture, we must allow that his work has made substantial additions to our knowledge on a subject the importance of which cannot be exaggerated. The accounts of Egyptian religion given by foreigners, whether Christians or any others, could not fail to be more or less superficial, unless they were prepared to acknowledge that there might be something beneath its outward ceremonial. It cannot be said that they were prepared to make any such admission; and even in the time of Herodotus Egyptian thought had, in Mr. Renouf's opinion, already taken the wrong direction, which rendered the downfall of their religion inevitable. The employment of animal forms as symbols of Deity, or rather of the several attributes of the Divine Being, had laid the foundations of what became afterwards a degraded animal worship; but it is of the utmost importance to note that this degradation was strictly an aftergrowth. Professor Max Müller had long ago spoken of the Rig Veda as belonging in certain parts to the earliest stages of human thought; but, unless we throw back to a vast distance of time the origin of Vedic literature, the literature of Egypt must take its place as beyond comparison the most ancient in the world. The exodus of the Israelites cannot, M. Renouf holds, be with any probability brought lower down than the fourteenth century before the Christian era, while the Great Pyramid cannot be more recent than 3000 B.C. The maxims of Ptahhotep belong to the age of the Pyramids, and therefore have an antiquity exceeding from fifteen to twenty centuries the highest claimed for the oldest portion of the Rig Veda. It is therefore, as M. Chabas has called it, the most ancient book of the world; but it appeals, nevertheless, to the authority of those who were then ancients, and it enforces a morality which rests on responsibility to a personal Creator and Preserver of all things, whose unity is declared to be absolute. This belief is set forth in hymns addressed, through a long series of ages, to what we may, if we please, call a multitude of gods. Osiris, Horus, Thoth, Amon, and many more, are each worshipped in language which to all appearance is purely monotheistic. A hymn preserved in two MSS. in the British Museum speaks of "the bringer of food, the creator of all good things," and says that "He is not graven in marble as an image bearing the double crown. He is not beheld; he hath neither ministrant nor offerings; he is not adored in sanctuaries; his abode is not known; no shrine (of his) is found with painted figures. There is no building that can contain him. Unknown is his name in heaven; he doth not manifest his forms. Vain are all representations." Yet this hymn is addressed to the Nile, who is identified with Ra, Amon, Ptah, and other gods. In another Amon Ra is invoked as "the ancient of heaven, Lord of all existences, the support of all things, the One in His works." It goes on to speak of him as "the maker of men, listening to the poor who is in distress, gentle of heart when one cries to him . . . Lord of wisdom, whose precepts are wise, Lord of mercy, most loving, at whose coming men live, opener of every eye, the One, maker of all that is . . . lying awake while all men sleep, to seek out the good of his creatures. Salutation to thee because thou abidest in us, adoration to thee because thou hast created us. Hail to thee, Lord of law . . . the One alone without a second, King alone, single among the gods, of many names, unknown in their number."

This last phrase must be taken as the explanation of the fact that, while the One Being is thus spoken of as "the same yesterday, to-day, and to-morrow," the several deities to whom the hymns speaking of this One God are addressed suffer from hunger, thirst, disease, and sorrow, and all require protection. They may be reckoned up almost by myriads; but the task of numbering them is needless, for it may be fairly said that almost any one may be substituted for or identified with another. The goddess

Hathor "is identified not only with Isis, but with Sechet at Memphis, Neith at Sais, Saosis at Heliopolis," and many more. "Mentu and Tmu, two of the great gods of Thebes, are merely aspects of the sun-god Ra." This may be called Henotheism, or the form of thought which regards a succession of deities in turn as each the One Supreme, all-perfect God, to the exclusion for the time being of all the rest; but in strictness of speech this term applies only when the worshipper addresses himself to the One God and Father of all men by one particular name. What are we to say when a number of deities are asserted to be one and the same God? "Thou, Agni, art Indra, thou art Vishnu. Thou art Varuna, when thou art born; thou art Mitra, when thou art kindled; thou art Aryaman"; and not only this, but Agni is also Prajâpati, Daksha, Brahm, and Skamba. For the time, at least, these are for the poet mere names for Him who is in His own nature incomprehensible, and the instinct which prompts the use of them is strictly monotheistic. There is, of course, the danger that this polyonomy may run on into a pantheistic philosophy or issue in a coarse polytheism. In Egypt both these results followed, and they were hastened perhaps by the mythological nature of the deities or powers which represented the action of the One unseen God in its multiform aspects. The old opinion that the Egyptians, although they had many gods, had no mythology, is, Mr. Renouf asserts, "altogether an erroneous one; it confuses the notion of myth with that of mythological tale or legend; and whilst the Egyptians really had an abundance of legendary tales, their myths are simply innumerable." These myths were, as they were everywhere else, mere phrases, which might consist only of one or two words. A few such phrases furnish the framework for all the legends of Œdipus, Herakles, or Bellerophon; and Mr. Renouf is brought by an examination of Egyptian myths to precisely those conclusions which have been reached by comparative mythologists who have worked on the traditions of the Aryan races. As soon as the nature of the myth is understood, all anomalies and seeming immoralities in the popular stories of the gods are, he says, at once explained. The birth of the sun "may be derived from ever so many different mothers. He may be the son of the Sky, or of the Dawn, or of the Sea, or of Night. . . . All myths are strictly true, but they can only be harmonized when translated into the language of physical reality." But the climate of the Nile valley determined the character of Egyptian mythology, which is concerned almost entirely with phenomena of regular and perpetual recurrence. Mr. Renouf's conclusion is sufficiently clear and definite; and he expresses it in the words which Professor Max Müller applied to the myths of the Aryan tribes. "Whatever may be the case in other mythologies, 'I look upon the sunrise and sunset, on the daily return of day and night, on the battle between light and darkness, on the whole solar drama in all its details, that is acted every day, every month, every year, in heaven and in earth, as the principal subject' of Egyptian mythology." The agreement of independent inquirers in different fields of research is a fact of the highest significance. It is no slight gain that Mr. Renouf's conclusions, after a careful examination of Egyptian belief and philosophy, should be in complete accordance with those which have been reached after a not less patient scrutiny of the ancient faith and literature of India.

THERE'S RUE FOR YOU.*

"TO Mudie's!" Such are the striking and expressive words with which this novel opens. Who is the speaker we are not at once told. In the second line, however, we get so far as to make the acquaintance of her footman. In ignorance, apparently, that he was listening to the words of a heroine, he did what all other footmen would have done under the circumstances—he touched his hat. He next put into the carriage a packet of books, a purse, card-basket, and Court Guide. These four articles, we learn, are "the paraphernalia necessary to a lady's afternoon in London." Paraphernalia used once to mean the goods which a wife possesses in her own right. Like many other words derived from the Greek, it has come down a good deal in the world. But to return from this digression to the footman of the speaker who has just opened the story of her life by uttering the simple words "To Mudie's!" We have left him on the pavement. His hat he had touched, and the paraphernalia he had handed in. Whether he had closed the door before the heroine spoke, whether he closed it after she had spoken, or whether he forgot to close it altogether, we are nowhere told. Something, perhaps, must be left to the reader's imagination; and at all events we next hear of him as jumping up beside the coachman. There he "gave the word, and the trim little brougham was soon swallowed up in the gloom of the December fog that hung over the city." The brougham went along Piccadilly, which suggests an allusion to the Tuscan poet's hell, through the streets by Long Acre, where some "glories" of Italian tapestry and the like were put forth for sale, until it reached Oxford Street. This it crossed slowly and with difficulty, and at last drew up "in front of a large gray building which, with its high windows and swinging glass-doors, was evidently the emporium of a brisk business of some sort." As the heroine had told the footman to drive to Mudie's, and as the footman had given the word to the coachman, as moreover the carriage had taken the road to Mudie's, and as there was no reason to believe that the coachman had lost his way, or was drunk, the reader feels a little annoyed at the attempt on the part of the author to make something of a mystery of this large gray building. Of course it was the emporium of a brisk business of some sort. It was a large circulating library. However, we must follow the fortunes of our heroine; of the footman we hear nothing more, at all events for the present. His absence, however, will be presently made up, and more than made up, by a butler. The lady took up the books—just one-fourth part of the paraphernalia—and descended. As she entered the emporium "she inhaled with pleasure the atmosphere of the place, that seemed to be impregnated with the odours of learning and leather." The alliteration is pretty, but it might be extended. In Mudie's there are to be seen many footmen with their pomatumed heads of hair. Let us say, then, that she inhaled with pleasure an atmosphere impregnated with the odours of learning, leather, and lackeys. She passed by rows of eager people and the indefatigable attendants. She seemed, we are told, to know the intricacies of the place. She looked neither to the right hand nor to the left, but "walked to the top of the room, where stood a red-and-white placard on which was printed in large letters, 'From F. to J.'" The thoughtful reader will at once surmise that between these two letters her own name is included. He will find that he is not mistaken, for her name is Heathcote. At last she succeeded in securing the notice of one of the attendants, and inquired for a copy of St. Aubyn's new poem. Thereupon follows this remarkable dialogue:—

"I don't think so, ma'm. We took in a hundred copies, but there has been so great a demand for it I think they are all out. I will go and see if a new lot has arrived."

"Would you also at the same time, please, get me one or two of the books on this list to make up my number."

Presently the attendant returned with the poem she had asked for, with its green cover and golden sunflowers. "She stretched out her hand, eagerly thanked him, and then nodding a bright 'Good morning,' walked quickly away with her treasure." How she reached her carriage, what orders she gave to her footman, how she handed in fresh paraphernalia, how he touched his hat, jumped up beside the coachman, and gave the word—all this is again left to the reader's imagination. Thus much we know, that the brougham dashed through Belgrave Square on its homeward way. "'Any more orders?' asked the coachman, having deposited his mistress at the door." Having answered the coachman, she turned to the butler, who silently awaited his orders. Does the silence of the butler contrast with the loquacity of the coachman? Ought he to have awaited in equal silence the orders of his mistress? We doubt it. The grave solemnity which becomes a butler might seem a little out of place on the box. The silence was at last broken by this remarkable utterance. "I am not 'at home' if any one calls. And we dine out this evening." We pass on to a small velvet-and-lace-clad figure that, for all the reader cares, might have remained silent also, but speaks after the fashion of babies who are learning to talk. From the child we pass on to a dark-eyed, intelligent-looking little French maid, and to a white cashmere tea-gown, and a lace-and-ribbon-decked toilet-table. At last we learn what manner of woman it was who, in the first line of the first page, said "To Mudie's!" The author might just as well, we should have thought, have introduced her to us before she set off for the emporium. But then she would not have been ushered in, as it were, by her footman, her coachman, her silent butler, and her lady's-maid. By the present arrangement she makes, we must allow, somewhat of a grand entrance as she dashes along in her brougham with her paraphernalia by her side. She does not fall far short of the idea we have formed to ourselves of an Odd-Fellow, when he is in what the Order calls full regalia. Mrs. Heathcote—for our heroine is a married woman—when she was arrayed in the soft clinging folds of her Indian muslin, with a golden fillet in her golden hair—her halo of golden curls, as it is elsewhere called—looked like a diaphanous creature. Nevertheless, she differed from the majority of diaphanous creatures in that her individuality, as we are told, was more accentuated and more positive. "The very scent of her dress as she swept along seemed to pervade the air, creating an atmosphere round her different to that which one looks for with the ordinary pretty, fashionable women one meets." We should have a more exact notion of what the author means did we know what is the atmosphere that one looks for with such women. But we must sweep along with the heroine, who pushed back a *portière* and entered a sitting-room, "which it was very easy to see was the favourite abiding-place of a refined and educated woman." It is well to know what in these days are the signs of refinement and education. We find there Eastern and Italian plates, easy-chairs standing invitingly about, small tables strewn with the daily papers, latest periodicals, and books, a three-legged table with a plate full of tempting bread and butter—nothing so vulgar as muffins, we beg the reader to note—and a Turkish stool inlaid with mother-of-pearl. The walls were covered with a rich, dark-coloured leather, so that the atmosphere must have seemed not very unlike that of Mudie's. The odours of learning and leather would pleasantly blend with the scent of a dress that creates an atmosphere different to that which one looks for with the ordinary pretty, fashionable women one meets. Mrs. Heathcote leisurely poured out a cup of tea—whether she drank it and ate some bread and butter, we are not told. Here, again—for at least the third time—something is left for the reader's imagination to supply. She took up a paper-knife—a large ivory paper-knife—and she cut the leaves of her green and gold volume.

* *There's Rue for You.* A Novel. By Mrs. Arthur Kennard. 2 vols. London: Chapman & Hall. 1880.

"Quickly and deftly did the slender pink fingers pass between each leaf." The book introduces the paper-knife, the paper-knife introduces her fingers, her fingers introduce her whole hand, and her whole hand gives us the key to her character:—

Grace's hand was one of the conical-fingered, small-thumbed palms; not a round, dimpled, shapeless hand, but one of the flexible, sensitive, fleshless sort; a hand that had artistic perceptions and instincts, but wanted determination and force to carry them to any definite end. It was the index of a nature impassioned, enthusiastic, and tender, but wanting in judgment, patience, and persistence.

It is about time, the reader will say, for Mr. Heathcote to appear. He lets himself into the house with a latch-key and slams the door. He finds fault with the tea and calls the green-covered book rubbish. His wife rings the bell, "which was immediately answered by a splendid creature in silk stockings." Whether he was the footman who touched his hat in the opening scene and handed in the paraphernalia, we are not told. At all events his name was John. That we learn from the command which was at once given him. "Would you please make some fresh tea, John? and be sure the water is boiling."

We have but described a single chapter of one volume of this novel, and can scarcely be said as yet to have given our readers any very exact notion of the plot. Nevertheless this first chapter enables them to form a just notion of what there is to follow. We rise indeed in society the further we go on. The second chapter opens with Mr. and Lady Adela Manners, who lived in a fashionable West-End square, and were celebrated for giving some of the best dinners in London. Before long we come to another lady, whose house was "the centre round which most of the luminaries of greatest magnitude revolved." She was so high up in fashion that she dared to refuse the request even of a Duchess, who "had the impertinence to come up and ask for an invitation for Lord and Lady Markham, her cousins twenty times removed." Her Grace, by the way, thereupon behaved very little better than a common scold. "She turned on her heel. 'What an impudent little minx that is! I will crush her some day, see if I don't.'" Whether that awful day of reckoning ever came we are nowhere told. Meantime the lovely lady "had it all her own way, and snubbed duchesses, marchionesses, countesses, and baronets' wives pretty well as she chose." Is there not here, by the way, an instance of the art of sinking, to begin with duchesses and end with the wives of baronets?

Lest our readers should imagine that the author in her account of footmen, furniture, and duchesses has forgotten to put in a plot, we hasten to assure them that that is by no means the case. Through the fine words some kind of a history can be traced by the patient reader. A madman, the poet St. Aubyn, falls in love with the heroine. He had once loved Maud Butler, the only child of a leading diplomatist. To her, we read, had descended pride from a long succession of Norman ancestors. She was deceived by her father, a proud ambitious man, and in a soliloquy she announced her intention of becoming worldly, heartless, and selfish. In three months "she made the most brilliant match of the season, and crowned her father's ambition" by marrying the eldest son of an earl. St. Aubyn goes mad, recovers, writes a poem, sees Mrs. Heathcote, falls in love with her without her knowing it, receives a solemn warning from a countess at an evening party, dashes out of the house, dives recklessly in and out of the carriages, runs home, sees a hideous spectre, raves for three or four pages, drinks off a strong-smelling brown liquid, sits down at his table, and sends his pen along with feverish rapidity over pages and pages of foolscap. He forgets the Countess's "utterances of Fate," and pursues Mrs. Heathcote once more. Her husband deserts her, and she is left for nearly half the book in a state of great misery. Unhappily for the reader, but most happily for the heroine, the madman keeps a diary; and when he dies full proof is found in it of her innocence. In the last chapter she has a most superfluous attack of typhoid fever. As, however, she was living at the time in Italy, here the author is certainly true to nature. Her husband arrives from England full of penitence, and discovers a tiny wan face, surrounded by a halo of golden curls. The story winds up magnificently with a great flame of crimson sunset sky, one last triumphant flash sent by the sunset, a dark space of gloom bathed in crimson flames, and two human beings wrapped in a rose-coloured cloud of glory. By a slight forgetfulness which greatly heightens the picture, the author represents the two human beings as both standing. Typhoid fever in stories runs, no doubt, a wondrous course, but even a heroine cannot be allowed to stand on her feet within four-and-twenty hours of recovering consciousness. Besides, just before the sunset began we had seen her propped up on a white pillow. We must look, however, to the general effect, and this certainly requires that, if she should be wrapped in a rose-coloured cloud of glory, she should not at the same time be wrapped in her blankets.

BRAZIL AND THE AMAZONS.*

THIS big book on a big country is calculated to remove from Americans, of whom we take Mr. Smith to be one, the reproach of doing things in too great a hurry. Popularly they are supposed to sweep through a gallery of antiquities or to survey a continent with the rapidity of a fire devouring one of their own prairies in the Far West. The present work is the result of successive visits and long journeys into the interior, coupled with residences at the principal towns of the Brazilian Empire. Mr. Smith explored the Amazon and its tributaries in 1870 and 1874, and then made two more journeys to the same places, during which he extended his survey to Rio Janeiro and the Southern provinces. He has studied geology; he shows a considerable knowledge of botany and zoology; he has carefully compared the writings of preceding travellers with his own observations; and he brings to bear on the problems of immigration, revenue, taxation, and the development of industry, an amount of intelligence which would do credit to a regularly trained politician. Now and then we have a little "tall" writing, apparently due to the wealth and gorgeousness of nature in the tropics. The trade-wind is described as a "play-wind, race-wind, wake-up-wind, pitch-and-tumble-wind." Sensitive plants fold their hands in silent prayer, and lift themselves every morning with silver tears of thanksgiving to the bright sunshine. Nature sends light-streaks down through the forest roof, when half a dozen leaves catch them and they glow like diamonds. Insects revel in perfume, dive deep in the honey-cups, come out staggering, and tumble about the branches in shameless inebriety. And the following description applies, not to a battle between three-deckers or ironclads, or German and French legions, but to the fresh waters of the Amazon river doing battle at its mouth with the ocean, and then deflected northward by the equatorial current:—"Its flank is turned, and it sweeps away northward, staining the sea with the blood of its defeat, littering it with *débris*, madly rushing into the heart of the enemy's country, until its last forces are exhausted and it sinks to annihilation, six hundred miles from the field of battle."

It is perilous to attempt a combination of the vagaries of Charles Dickens with the picturesque exaggerations of Mr. Ruskin. But it would be extremely unfair not to admit that this spasmodic brilliancy does not detract from the solid merits of the whole work. There is an immense deal that is either new or suggestive, or an improvement on the researches of those predecessors to whom the author acknowledges his indebtedness. We will take first the Amazon and its tributaries. Mr. Smith has an admiration for this noble river which surprises us in one who might be pardoned for thinking that the Mississippi could whip every stream in the world. His first and his last chapters are devoted to the Amazon and its tributaries. Though exceeded in length by other rivers of the Old and the New World, it has a course of nearly three thousand miles. It rolls down more water than any other two rivers taken together. Its depth is enormous. It has sixteen tributaries of the first-class, some of which are a thousand miles in length, while none are less than seven hundred. The smaller affluents that run into the Amazon or its branches number one hundred and nine. It has a "bore" near the mouth, which, like the phenomenon of the same kind observable on the Ganges, rises in a solid mass, uproots trees, sinks vessels at anchor, and scatters canoes. When in flood after the rainy season, the Amazon turns the whole country on either bank into a flood-plain, as Mr. Smith calls it, or a *varzea*, as the Brazilians term it. This feature seems, from the repeated descriptions, to be a huge network of streams where two or three main channels combine with innumerable smaller ones to send a volume of water over grassy plains, thus enabling Indians to thread their way through swamps and forests with strange vegetation and animal life of their own. In fact, this river reproduces on a similar scale the features which are familiar to any one who has travelled in a pinnace or a *bauliah* over the plains of Eastern or Central Bengal when submerged by the rains between July and September. Of the beauty of the Amazon and its tributaries Mr. Herbert Smith never seems to tire. He is perpetually telling us of the enormous expanse of some of its reaches, so vast as to give a water-line for the horizon; of its dense forests impervious to the sun and impenetrable to the boldest traveller; of its countless palms towering above scores of other trees and shrubs and delicate vines; of the primitive Indian villages, diversified by a clearing made by some adventurous American who has incautiously been tempted to imperil his health and substance in a hopeless contest against nature in the tropics; of the splendid tints; of the glaring colours; of the warm days and the cool nights; of the sense of unlimited freedom and the immunity from corroding care.

It is only just to state that Mr. Smith never palliates or hides the discomforts inevitable in such explorations. He was very soon obliged to leave steamers for a canoe; and with a crew of natives he ascended the Tapajos, one of those mighty affluents of the Amazon which flow into it from the south. He explored the Curua, which comes into the same big river from the north. He cut his way for some days through the forest, and was very glad to get back alive. Doubtless it was pleasant to fly along these streams in a light canoe before an exhilarating breeze, to collect specimens, to converse with Indians and settlers, to appreciate the virtues of the noble savage, and to calculate the chances of a countryman's success. But this experience was purchased by real hardships. He and his companions rowed or sailed all day, or forced their canoe over dangerous rapids, sometimes wading breast-high amidst slippery rocks. They bivouacked on the beach at night, lived on hot coffee, mandioca cakes, an occasional duck, a deer or two or a stray monkey. They were devoured by mosquitoes, bitten by spiders, preyed on by ants,

* *Brazil, the Amazons, and the Coast.* By Herbert H. Smith. Illustrated from Sketches by J. Wells Champney and others. London: Sampson Low & Co. 1880.

and severely pricked by nasty fishes. At some places they met with hospitality in a small Settlement. And, though there were rumours of fever and ague at particular seasons of the year, and some swampy localities appear from the description to be perfect hotbeds of disease, his party never seem to have suffered. In these explorations Mr. Smith was enabled to form a judgment regarding the main products of the Amazons. When the flood-plains or *varzeas* are not under water, they serve as grazing grounds for countless herds of cattle, and some proprietors own from ten to thirty thousand head. Hides are largely exported, and it is conjectured that butter might be made in large quantities if some enterprising American would only buy the herds, churn the butter, and pack it in ice. Cacao or cocoa is an important industry. The plantations must be on the low ground, and at the same time above the reach of the floods; and Mr. Smith expatiates on the facilities for growing the plant, on the beauty of the orchards, and on the excellence of the product, whether as chocolate or jelly, in spite of the evident want of care in packing and preparation. Seven million of pounds of cacao are exported every year, of which the greater portion goes to France, a little to England; and none to America. But india-rubber is the largest and the worst-managed branch of industry. The gum is collected by a tribe of half-wild men called *seringueiros*, who kill the trees by recklessness and waste. There seems to be a doubt to whom the forests belong. Said to be the property of the Government, they are owned or claimed by private persons, and if one so-called proprietor deserts a "rubber-swamp," any one else can take it up. The rubber is sold to small traders who carry it to merchants at Para. On the Madeira and the Purus rivers the business is in the hands of large proprietors; but the preparation of the gum from the milk is unscientific; the rubber-gatherers are opposed to all changes and reforms; more than half the traders are in debt; everything is carried on under credit and not by ready money; and the whole system obviously is unsound. Government ought to step in and create a Forest Department, as the Indian Government has done, lease out tracts, and provide for a proper system of bleeding, preserving, and recruiting the plantations. But the officials are negligent or corrupt, and the Emperor cannot see to everything, and so a trade of twenty millions of pounds, valued at six millions of dollars, only encourages idleness and improvidence or serves to make the fortunes of about a dozen men.

The Curua forest is also celebrated for the Brazilian nut. As an export it comes next to rubber and cacao. The tree itself is magnificent. Some are two hundred feet in height, with no branch lower than one hundred feet from the ground. No one thinks of climbing these giants to collect the fruit. Nature produces the fruit in a round, hard, black case, each of which holds about sixteen nuts. The cases, weighing two or three pounds, fall off when ripe, and sometimes kill the nut-gatherers, who have to keep indoors when a strong wind blows. The nuts or cases are collected by Indians and half-castes, who, besides running the chances of a broken skull, are cheated by traders, racked by fever, drowned in the rapids, and even lost in the woods. The nuts go to England in enormous quantities; but, when fresh, taste very differently from the stale, oleaginous articles of the stall. There is all the difference between a Brazilian nut on the Tocantin or a fresh cocoa-nut gathered in Jessore or Nuddia, and the same products when sold five thousand miles from their native home.

In spite of all that Mr. Herbert Smith can say for the Amazon and its tributaries, life, whether at Para, Santarem, or Alenquer, strikes us as singularly unpleasant. You are just on the Equator. There are the usual tropical inconveniences—heat and damp, constant rains and thunderstorms—without any of those alleviations which make life endurable at Calcutta, Singapore, or Hong Kong. Mr. Smith speaks favourably of a certain preparation known as *vinho d'assai*, a sort of sherbet, made out of dark berries and mixed with sugar or a little mandioca flour. It has "a brisk nutty flavour," and you can make a decent lunch off it. But we confess that this delectable syrup by itself would not reconcile us to a life at Para; the morning heat, almost invariably followed by a deluge of rain and a thunderstorm in the afternoon; the filthy courtyards, the occasional typhoid fever, the low standard of social morality, the utter corruption of the clergy, the usurping vegetation, and the perpetual sunshine. Mr. Smith gives lively sketches of the different fates of two of his countrymen who had "located" themselves in the valley of the Amazons. Mr. Platts had been invited, apparently by the Brazilian Government, to settle near Santarem. He was supported at first on rations, and lodged in a huge thatched building. But he had soon to shift for himself; to build his own shed, cut his own road, bring his stores on his own back from the town just six miles off, and to buy a sugar-cane plantation from an old Indian woman. He had to get everything on credit, and to be his own carpenter, mason, and engineer. No wonder that poor Mr. Platts looked careworn and discouraged. On the other hand, Mr. R. J. Rhome was a thoroughly practical citizen, who believed in his own theories and was prepared to carry them out. He joined the Baron of Santarem as managing partner of a fine plantation twenty miles below Santarem. The property is not measured by acres but by square miles. On it we find sugar-cane plantations, pastures, forests, lakes swarming with fish and turtle; a capital house, beautifully situated, with a fine river in front and a range of hills at the back; house servants and negroes, thriving industry, profuse hospitality, and the latest inventions for crushing sugar-canes and making rum. But it is not every intelligent citizen of New York or Boston who can find a Brazilian baron ready to admit him as partner in an estate of great capabilities. We must here join issue with Mr. Smith, who, quoting Mr. Wallace, holds that it is a vulgar error to say that "in the tropics the luxuriance of vegetation overpowers the efforts of man," and that nature and climate are nowhere so favourable to the labourer. The experience of any Anglo-Indian in tea, indigo, rice, or coffee, is, we venture to say, in flat contradiction to the assertion. But we quite agree with our author in the remarks to intending emigrants made at page 175, and would recommend no one to try the Tocantins or the Tapajos without some amount of capital and a very definite idea of what he wishes to buy or grow.

The chapter on Ceara and the famine will suggest to many readers the analogy of these calamities in Behar and Madras. Ceara is a province of Eastern Brazil on the sea coast. It is tableland known as *Sertao* or Wilderness, broken by ranges of mountains varying from two to five thousand feet in height. Here we must not expect to find the luxuriance of the Amazonian forests. We hear of thin woods, sandy tracts, pastures more like North America, and a marked division of the seasons. From June to December the rains almost entirely cease, and the dry trade winds blow from the east and north-east. But when after January the rainy season fails, as it did in 1877, the condition of the province becomes as bad as was that of Orissa in 1866 and Behar in 1874. Ceara had a scattered population, and there were owners of large estates who maintained a sort of feudal sway over a number of non-proprietors of a type created by the admixture of white, Indian, and negro blood. Communication was carried on by pack-horses or clumsy carts over very rough roads, and the inhabitants hunted on the hill ranges or cultivated mandioca and vegetables on the "rolling plains." In 1877 the ordinary dry season of the latter half of one year was followed by a drought in the spring and summer. The terrible scenes of 1824-25 were repeated. The helpless peasants called in vain on St. Joseph, or, pale and emaciated, flocked to the towns. Private charity did not fail, but the author accuses the Government of blindness and insensibility, and of mismanaging the relief which it tardily doled out. After the famine there came, as usual, fever, smallpox, and the paralysing disease called *beri-beri*. Any kind of garbage was consumed by the sufferers, and there were even stories of cannibalism. It is calculated that half a million of the population died from these causes, all taken together. Mr. Smith delights to record the energy and benevolence of a certain Dr. Gomes Pereira, a quiet, unassuming lawyer, who practised very little at the Bar, as he had to manage a large estate of his own. This gentleman seems to have had that administrative capacity and vigour which Anglo-Indians have so often displayed. He set the immigrants to work on building a town hall, a church, a prison; he housed them in well-ventilated barracks; he exacted a moderate amount of labour for rations; comforted the widow; clothed the naked; saved ten thousand lives; and, to this hour, does not know that he has done anything wonderful. Mr. Smith was there at the time, and evidently speaks of this unpretending advocate in the tone "Si quid mea carmina possunt, nulla dies unquam," &c.

From Ceara the author went down the coast to Pernambuco, Bahia, and Rio Janeiro, and has suggestive remarks about each place. Pernambuco is the outlet of a rich region of forest, but it has an awkward reef, within which small vessels can find shelter, while large ocean steamers must anchor out in the roads. There is here an old and a new town, and a delightful suburb where the residents enjoy sea air and bathing. Bahia has a harbour, inferior only to Rio. It is a picturesque old town; exports sugar, cotton, hides, and diamonds; and enjoys a practical monopoly of the tobacco trade. At Rio Mr. Smith finds most to praise in the Sugar Loaf Hill, the splendid harbour, and the gardens of Botofogo. Social life is tainted and corrupt. The mothers spoil their children, who grow up luxurious and disinclined to work. Yellow fever is localized by bad drainage and want of sanitation. The country lies under the curse of slavery, though this detested institution must end by 1892. The commercial system of the Brazilian Government is eminently unsound, according to Mr. Smith. Heavy duties are laid on almost every article of export. Cotton has been ruined in this way; sugar is confined and narrowed; American merchants hardly meet with fair play, and when they import cargoes of flour can carry away little or nothing but coffee. As to the production of this article Mr. Smith has a good deal to tell us. He was hospitably received and shown over a fine coffee plantation. The owner was quite alive to the necessity of keeping pace with the times. He had brought under cultivation 2,400 acres out of 4,000; he had introduced new machinery; he employed a steam-engine to air and dry the berry; he owned fine oxen and mules; his poultry yard was crowded; and his gangs of negroes were drilled, fed, called to prayers, summoned to their meals, and sent to bed with the precision of clock-work. But the whole system seems to us as unsound as it did to Mr. Smith. There is no room in this part of the Empire for small coffee proprietors. Rich owners have been permitted to seize on large tracts and to hold them without cultivation. There is a railroad of three hundred and sixty-five miles in length to which constant additions are being made. But the directors of these lines are compelled to charge heavily for freight, and could not exist were it not that Government guaranteed them a good rate of interest. Altogether the picture drawn by Mr. Smith leads to the conclusion that progress in Southern Brazil must be slow. Immigrants will not be tempted by a hot climate, a strong competition, a high tariff, and a meddlesome Government. We note with surprise not unmingled with admiration, that Mr. Smith warns Brazilians who

"murmur for a republic" that "a republican government is precisely the most difficult to carry on."

There are several other interesting topics to which we can only draw attention. We are told some amusing myths and stories of folklore, in which stupid jaguars are outwitted by clever land-tortoises and monkeys, and the cotia or agouti plays all kinds of amusing pranks. There is one good map of a part of the Amazon river which makes us long for a more complete one of the whole kingdom. The letterpress is enlivened by more than a hundred neat illustrations of the scenery and inhabitants of different parts of the Empire. We find a tolerable index, and can recommend the work to those readers who desire materials for drawing a comparison between the numerous Republics of South America and its sole surviving monarchy. With all its faults and imperfections, we take the Brazilian Empire to be, on the whole, as superior to Ecuador, Peru, and the Argentine Republic, as Mr. Smith's work is undoubtedly superior to the general run of such bulky publications.

HOLLAND'S ELEMENTS OF JURISPRUDENCE.*

PROFESSOR HOLLAND is to be congratulated on having done a piece of work that was much called for. Though several years have passed since the Universities and the Inns of Court proclaimed the importance of jurisprudence as a part of legal education, nobody has taken up Austin's unfinished work in a serious or satisfactory manner, or succeeded in making it very clear what jurisprudence really is. To English students it means at present, for all practical purposes, the two volumes of Austin's Lectures, or the one volume into which their matter has been more lately condensed by his able editor. It may be true of Austin's work, as Professor Holland says (though he seems to confine his praise to the introductory part, originally published as "The Province of Jurisprudence Determined"), that no one can read it without improvement; but it is not desirable that it should remain for an indefinite time the only means of improvement in this department of knowledge available for our seats of learning. Austin's book is, after all, a fragmentary publication, and has the faults incidental to this character, in addition to the others with which it is chargeable. As we are not now criticizing Austin, we will only say that these are precisely of the kind which make a book less fit for the use of beginners. Besides, the increase of general knowledge and interest has a certain effect on the relative importance of different parts of a great subject. "Those distinctions upon which Austin after his somewhat superfluously careful manner bestows most labour, are put in so clear a light that they can hardly again be lost sight of"; and if there is one thing more than another for which we ought fervently to thank Austin's labours, it is that at this time of day no rational being could or would occupy six lectures with the discussion of what positive law is not. For the rest, Professor Holland's preface, while it points out with unquestionable truth that "works upon legal system by English writers have hitherto been singularly unsystematic," is studiously courteous to his predecessors. It is perhaps an excess of courtesy to mention Dr. Broom's work on Legal Maxims, a thing of neither fish nor flesh, on the same level with Smith's *Leading Cases*, which, though it never pretended to be anything but technical, stands in the first rank of our technical books.

Jurisprudence is defined by Professor Holland as the formal science of law: "not the material science of those portions of the law which various nations have in common, but the formal science of those relations of mankind which are generally recognized as having legal consequences." It stands towards actual legal systems, past or present, in a relation like that of grammar to particular languages. As a matter of fact, its construction has been suggested by the comparison of different systems, but such comparison is not in itself a necessary condition for the existence of such a science. "Just as similarities and differences in the growth of different languages are collected and arranged by Comparative Philology, and the facts thus collected are the foundation of abstract Grammar; so Comparative Law collects and tabulates the legal institutions of various countries, and from the results thus prepared the abstract science of Jurisprudence is enabled to set forth an orderly view of the ideas and methods which have been variously realized in actual systems."

The parallel is felicitous; only we fear that, if it be just, it goes a little too far for the writer's purpose. Abstract grammar, in the sense here specified, is evidently a conceivable science. But is it an actual science in the sense of being explicitly taught or learnt by any one? We have never heard of its professors or text-books; and, while the reviewer of a treatise on jurisprudence may disclaim any pretension or obligation to be acquainted with the latest developments of modern philology, we may also say that if any such teachers or books existed we think we should have heard of them. Abstract grammar is given by implication in every systematic grammar of a particular language, and its generality appears as soon as the grammatical structure of two different languages is referred to a common type. When the English schoolboy who has learnt Latin learns (if he ever does) enough of his own language to know that the verbal-substantive forms in "I go a-fishing" and in "Lusum it Mæcenas" are homologous, he makes an application of abstract grammar. When the comparative philologist performs a like process on a larger scale, he must either come to his task equipped with a scheme of abstract grammar or make one as he goes along. But neither boys nor men learn abstract grammar by itself. The reason, we suppose, is that the subject-matter cannot be understood until the learner has mastered the grammar of at least one concrete language; and, if the language be a tolerably developed one, and the grammar arranged on a tolerably rational plan, in learning the matter he has learnt the form also. There is no need for his learning it over again in the abstract; to appreciate its importance as form he has only to await the occasion of applying it to new matter. Perhaps it may be said that a person who, being empirically master of his own language, takes up the grammar of it for the first time, is really learning abstract grammar; for in this case the matter consists of what he knows already. Not the less does he acquire the abstract system through the concrete application. We may observe in passing that Philology is considerably richer than Jurisprudence both in the variety of actual types to be observed and in the number of distinct systematic arrangements that have been constructed. Greek, Indian, and Arabic grammarians worked out their schemes in perfect independence. It would seem that philologists have great opportunities for elaborating the science of abstract grammar; what use they have made of them is more than the present writer can say; but we cannot help suspecting that our leaders in philology would not think such an operation very profitable.

Again; the student of medicine learns vertebrate anatomy, which is the knowledge of particular vertebrate structures. He learns comparative anatomy, whereby he comes to perceive the analogies of different vertebrate structures. Hence he forms the idea of a general vertebrate type, which is not the image of any existing skeleton, but is a generic symbol of a certain disposition and relation of parts which any specific vertebrate skeleton embodies and makes visible. Shall we regard this as a new and distinct knowledge or science, and call it abstract vertebrate anatomy? and, if we do, can it be taught or learnt in its abstract character?

It appears to us that jurisprudence, as more or less vaguely understood in English usage of the term, and now clearly defined by Professor Holland, is doomed to vacillate between two alternatives, of which both are unsatisfying. It may confine itself to making out a catalogue of blank forms; in other words, to the pure theory of legal classification. We do not for a moment deny that the scientific arrangement of the law is a subject worthy of the most careful discussion. But we do not think it a good subject to be dwelt upon by students at an early stage. The reasons for or against a particular scheme cannot be understood until the matter to be dealt with by it is to some extent familiar. If, on the other hand, jurisprudence undertakes to explain and illustrate the blank forms of its classification by showing how they are filled up, its constant tendency is to slide into the partial exposition—comparative or otherwise—of some particular system. This tendency appears more than once in Professor Holland's work, as where he brings in a statement of the peculiar and by no means elementary English doctrine of contributory negligence. One feels, again, that his broad mention of the results educible from the tangle of statutes that make up our law of copyright is either too much or too little; too much for a treatise on the general form of laws, too little for a treatise on the laws of England.

Since the law of England is, by the consent of all persons who have seriously thought about it, in sore need of a systematic expounder, the best and most profitable way to prove the value of jurisprudence would perhaps be to show it in that specific application. If Professor Holland, or some other equally competent worker, or two or three such together, would give us a good book of Institutes of English law, that would indeed be a boon for lawyers and students to welcome. As it is, our young men hear lectures on jurisprudence and legal method in general, and have to pick up their first notions of the law of their own country from mauled and tinkered editions or imitations of Blackstone put together in open defiance of all rational arrangement. Blackstone's work was an excellent one in his time and according to his lights; we might honour him better at this day than by a blundering lip-service which, as a rule, effectually excludes the knowledge of what Blackstone really wrote.

And, in fact, if we turn to Germany, where the academic teaching of law is more fully developed than with us, we shall find a state of things which Professor Holland mentions with a certain air of surprise. Although the last thing that can be said against the German school is that the philosophical and theoretical consideration of legal conceptions fails to find expression in it, there are no distinct organs or departments for the purely formal science of law. What in England we have lately called jurisprudence is embodied by German writers in their extensive and methodical treatises known as *Pandekten*, of which the subject is modern Roman law—that is, so much of the Roman civil law as has furnished, or may be considered capable of furnishing, the groundwork of the modern law of German States. Most, if not all, of these works contain a certain amount of matter of a highly general nature; but this is treated, and as we think rightly so, as preliminary to the study of the particular system.

At the same time, we by no means wish to undervalue Professor Holland's enterprise. Thinking it good as far as it goes, we think a scientific exposition of English law would be still better, and

* *The Elements of Jurisprudence.* By Thomas Erskine Holland, D.C.L., &c. Oxford: Clarendon Press. 1880.

should be regarded as the end to which our provisional study of abstract jurisprudence is to lead up. This position may be illustrated by returning to the philological comparison which has already been our text. Let us suppose that the English language, instead of being the simplest member of a group, stands apart from all others, and is exceedingly complex in structure and full of anomalies. Let us also suppose (a thing less widely remote from the truth) that the literature relating to it—comprising grammars, dictionaries, and philological works of all kinds—is of enormous bulk and contains much matter of great value, but is terribly diffuse, and arranged partly on wrong systems and mostly on no system at all. In this state of confusion it might well be that the cultivation of abstract grammar would precede the actual reform of English grammar, and it is even conceivable that this might be the only way to it. And this imaginary case is roughly parallel to the real state of English legal literature. A general view of the field of Positive Law, with only just so much concrete illustration as is needed to make it intelligible, may do much to clear the heads of learners, and beget in them a just discontent with the crude and formless condition in which the details of almost every topic are still left. To make a cosmos out of this chaos of disjointed particulars is a task which a later generation, prepared by such teaching as Professor Holland's, may be able to attempt with good hope of success. Meanwhile Professor Holland's treatment of his subject deserves a fuller consideration than we can give to it at the end of an article, and we accordingly reserve the specific discussion of his work for a future notice.

THE PURCELL PAPERS.*

THE literary ambition of the Fat Boy in *Pickwick* was to make the old lady's blood run cold. The genius of the late Mr. Sheridan Le Fanu (the author of *Uncle Silas*, *Wylder's Hand*, *Through a Glass Darkly*, and other romances) was also of a chill and curdling nature. No author more frequently caused a reader to look over his shoulder in the dead hour of the night. None made a nervous visitor feel more uncomfortable in the big, bleak bedrooms of old Highland houses. Mr. Le Fanu did not deal much in actual ghosts. His apparitions were much more fearful wild-fowl. "What a sell it would be for a ghost," said a clever but slangy little boy, "if he appeared to a lunatic!" The behaviour of the lunatic, so unlike that of a sane person in the presence of the supernatural, would indeed be likely to vex and discomfit a spectre accustomed to rational society. Mr. Le Fanu's ghosts, on the other hand, had a way of turning out to be the family idiot, the monstrous birth, or other horror of flesh and blood which fine old families are supposed to keep in a secluded corner of fine old castles. These substantial apparitions were more horrible in Mr. Le Fanu's books than the airy banshee or immaterial bogey of civilization. You had first the horror caused in well-regulated minds by the supernatural—which is an evanescent feeling, for familiarity with the bodiless breeds indifference, if not contempt. Next you had the revulsion of feeling caused by the discovery that the supposed ghost was something human and yet not human, something wild and semi-bestial, like the "Alastor" or avenging fiend that haunted the House of Atreus. Indeed, if Mr. Le Fanu had dealt in classical and mythological horrors, he would doubtless have hinted that the hateful and hungry spirit whom Cassandra beheld in vision was only old Thyestes in his dotage, moping and prowling in the scenes of murder and worse than murder.

To these amiable and attractive qualities of fancy Mr. Le Fanu added considerable power of dealing with the real old-fashioned supernatural. Dom Calmet knew no better vampire than his Carmilla, beside whom the young person in Mr. John Payne's *Lautrec* is a mere sentimental impostor. *Carmilla* is a tale that every parent should make haste not to place in the hands of the young. Neither Poe nor Richepin ever invented anything more horrible than the dusky, undulating nocturnal shape of her who was a fair woman by daylight and an insatiate fiend at night. M. Le Fanu's skill in the weaving of plots was greater, we think, than that of Mr. Wilkie Collins, as his humour was more spontaneous and less mechanical. *Wylder's Hand* is a very well managed story. *Guy Deverell* might, we venture to think, have been improved by a very simple device. The wicked baronet should have died (of apoplexy) in the secret chamber of his vicious pleasures, whereby we should have gained a mystery, and been spared a murder.

We have been led to make these retrospective criticisms on Mr. Le Fanu's genius by the publication of a posthumous work, a collection of short tales called *The Purcell Papers*. To this collection Mr. A. P. Graves has prefixed a short memoir of Mr. Le Fanu. Little was known of the novelist's quiet history by the English public, though most novel-readers greatly miss the talent that died with Le Fanu, six years ago. Mr. Le Fanu came of a noble Huguenot stock. His ancestors emigrated to England after the Revocation of the Edict of Nantes, and some of them served in the armies of the Prince of Orange. The novelist was the grandson of Joseph Le Fanu and of Alicia, sister of Richard Brinsley Sheridan. He was born in Dublin, on August 28, 1814. His first literary productions were, of course, poems and rollicking Irish ballads. He became a barrister, but only in name, and at the age of twenty-four purchased an Irish newspaper. His literary life, Mr. Graves says, may be divided into three periods. Till his thirtieth year he was an Irish ballad, song, and story writer, who published his works, as a rule, in the *Dublin University Magazine*. He married in 1844, and devoted himself for fifteen years to journalism. During this period he attempted one or two novels, which had no great success. In 1863 he published the *House by the Churchyard*, which was followed by *Uncle Silas*, and till the end of his days he was best known as a writer of fiction. Mr. Le Fanu was a man of quiet and retiring life, with an amateur interest in the supernatural. He had too much sense to believe in Spiritualism, but he dearly loved an honest ghost for its own sake.

The *Purcell Papers* are a collection of Mr. Le Fanu's early stories and sketches. They vary much in power, though a certain simpleness and sobriety of style is common to all of them. Nothing spoils a ghost story more than a florid, or pretentious, or too ingenious style. The narrator ought to seem absorbed in his topic; his tale should be plain and unvarnished. Mr. Le Fanu's manner in the more serious, not to say sepulchral, of the Purcell stories is just what it ought to be. In the humorous tales, as in "The Ghost and the Bonesetter," he is less amusing, but probably more true to Irish nature, than Lever. One tale has nothing in it of the supernatural, nor even of the extraordinary, and yet it is a story of very great power. The "Last Heir of Castle Connor," who gives his name to the narrative, was a young man of great beauty and great promise, the only son of his mother, and she was a widow. Unfortunately, he became intimate with the noted duellist Fitzgerald, whose appearance is thus described:—

> He was a tall, square-shouldered man, who stood in a careless attitude, leaning with his back to the wall; he seemed to have secluded himself from the busy multitudes which moved noisily and gaily around him, and nobody seemed to observe or to converse with him. He was fashionably dressed, but perhaps rather extravagantly; his face was full and heavy, expressive of sullenness and stupidity, and marked with the lines of strong vulgarity; his age might be somewhere between forty and fifty. Such as I have endeavoured to describe him, he remained motionless, his arms doggedly folded across his broad chest, and turning his sullen eyes from corner to corner of the room, as if eager to detect some object on which to vent his ill-humour.

To know "fighting Fitzgerald" was a dangerous privilege. On the slightest shadow of a misunderstanding his acquaintances felt bound in honour to ask for an explanation, and the explanation usually ended in a fatal duel. Fitzgerald's personal vanity was interested in killing his man, and nothing could be less like a duel with M. Gambetta at forty paces on a misty morning than a combat with this murderous Irishman. O'Connor, like so many others, had to ask Mr. Fitzgerald to "explain" his conduct. At first the duellist replied in a satisfactory way, but, distrusting his first impulse, "which is generally good," he declared that he was compelled to consider himself challenged. O'Connor was obliged to fight, and, believing himself to be a doomed man, he purposely fired wide. Fitzgerald then deliberately murdered him, under the forms of "honour," in the manner thus described:—

> The principals took their places once more, and M'Creagh proceeded, with the nicest and most anxious care, to load the pistols; and this task being accomplished, Fitzgerald whispered something in the Captain's ear, who instantly drew his friend's horse so as to place him within a step of his rider, and then tightened the girths. This accomplished, Fitzgerald proceeded deliberately to remove his coat, which he threw across his horse in front of the saddle; and then, with the assistance of M'Creagh, he rolled the shirt sleeve up to the shoulder, so as to leave the whole of his muscular arm perfectly naked. A cry of "Coward, coward! butcher, butcher!" arose from the crowd.
>
> . . . .
>
> There was now a breathless silence. O'Connor stood perfectly motionless; and, excepting the death-like paleness of his features, he exhibited no sign of agitation. His eye was steady—his lip did not tremble—his attitude was calm. The Captain, having re-examined the priming of the pistols, placed one of them in the hand of Fitzgerald—M'Donough inquired whether the parties were prepared, and having been answered in the affirmative, he proceeded to give the word, "Ready." Fitzgerald raised his hand, but almost instantly lowered it again. The crowd had pressed too much forward as it appeared, and his eye had been unsteadied by the flapping of the skirt of a frieze riding-coat worn by one of the spectators.
>
> "In the name of my principal," said the Captain, "I must and do insist upon these gentlemen moving back a little. We ask but little; fair play, and no favour."
>
> The crowd moved as requested. M'Donough repeated his former question, and was answered as before. There was a breathless silence. Fitzgerald fixed his eye upon O'Connor. The appointed signal, "Ready, fire!" was given. There was a pause while one might slowly reckon three—Fitzgerald fired—and O'Connor fell helplessly upon the ground.

This description loses in a curtailed quotation, and ought to be read in the original narrative. People who deplore, as sometimes people do, the decline of duelling, should remember the condition into which the practice brought Irish society. This man Fitzgerald is represented as a gambler and scoundrel who had the life of every gentleman in his hand. O'Connor ought, doubtless, to have shot him dead when he had the chance; and O'Connor's peasantry could hardly have been blamed if they had avenged the master whose butchery they went to witness as they might have gone to a steeplechase.

Putting aside the comic portions of the *Purcell Papers*, which are only moderately funny, the remainder form a series of delightful nightmares. M. Le Fanu appears to have studied the horrors of visions in which "we dream of the devil and wake in a fright"; or lie benumbed with dread while some fancied horror approaches us. "The Fortunes of Sir Robert Ardagh" are "all about the devil," as the small boy said, when asked to give some account of the tract presented to him by a pious relative. The same ghostly

* *The Purcell Papers.* By the late J. Sheridan Le Fanu. With a Memoir by A. P. Graves. 3 vols. London: Richard Bentley & Son. 1880.

foe is very nicely managed in "The Drunkard's Dream," where "the bad place" is treated with much delicacy of touch and originality of design. This is a story which, to quote De Quincey's amateur, "one can recommend to a friend." "A Chapter in the History of a Tyrone Family" reminds one of an incident in *Jane Eyre*. Here is a good supernatural touch:—

> I accordingly opened the door, and was about to enter, when something like a mass of black tapestry, as it appeared, disturbed by my sudden approach, fell from above the door, so as completely to screen the aperture; the startling unexpectedness of the occurrence, and the rustling noise which the drapery made in its descent, caused me involuntarily to step two or three paces backwards. I turned, smiling and half ashamed, to the old servant, and said:
>
> "You see what a coward I am."
>
> The woman looked puzzled, and, without saying any more, I was about to draw aside the curtain and enter the room, when, upon turning to do so, I was surprised to find that nothing whatever interposed to obstruct the passage.
>
> I went into the room, followed by the servant-woman, and was amazed to find that it, like the one below, was wainscoted, and that nothing like drapery was to be found near the door.
>
> "Where is it?" said I; "what has become of it?"
>
> "What does your ladyship wish to know?" said the old woman.
>
> "Where is the black curtain that fell across the door, when I attempted first to come to my chamber?" answered I.
>
> "The cross of Christ about us!" said the old woman, turning suddenly pale.

The efforts of a blind lunatic to cut some one's throat with a razor are also described with singular felicity. A good manslaughter, the operator tooling with a novel instrument, will be found in "Hardress Fitzgerald," while the "Passage in the Secret History of an Irish Countess" contains the germ of *Uncle Silas*. There is a realism in these Irish stories which one misses in the sufficiently horrible account of an "Incident in the Life of Schalken the Painter."

A judicious reader of the *Purcell Papers* may enjoy many moments of what are called "creepy" sensations. The book is ill-timed for summer, and London; it should be read in winter, when the nights are long, and in some country house where banshees are still strictly preserved, and brownies are as common as ground-game.

MOHL'S HISTORY OF ORIENTAL STUDIES.*

THESE volumes will form the most enduring record of a life full of energy in the cause of learning, and crowned with a conspicuous measure of success in the task to which it was devoted. Jules Mohl will live in the memories of Persian scholars by his noble edition and translation of Firdousi's great epic, which his widow has now wisely removed from the dignified seclusion of the gorgeous and cumbrous *éditions de luxe* of the Imprimerie Nationale, and reissued in a convenient and purchasable form; but Orientalists and the scientific world in general will chiefly associate the name of the Persian Professor at the Collège de France with the annual reports which, as secretary, and latterly as president, he used to deliver to the Société Asiatique on the progress made in Oriental studies during the preceding year, and Mme. Mohl has done a good service to the history of research, as well as to her husband's memory, in rescuing these valuable literary surveys from the precarious and dispersed existence of separate *brochures*.

The great desire of Mohl's life was to obtain for Oriental studies the same recognition which had always been accorded to the so-called classical literatures. The science, the letters, the history, the whole development of the East are an integral part of the world's history, just as much as the science and the progress of Europe; but the former have always been kept at arm's length, treated as things afar off, and relegated to the studies of recluses. Mohl wished to bring the East more into the public light, to force people to take an interest in matters which, if they were only called Hellenic, would have been long before pronounced fascinating, and to encourage the prosecution of Oriental studies in an equal degree with classical research, until it should be possible to conceive of the great unknown East as an intelligible whole, and not as a collection of curious superstitions and barbarities which formed the amusement of middle-aged men who had nothing better to think about. This co-ordination of Oriental learning was his constant aim. His whole life was a protest against extreme specialism. He maintained that the great thing needed was to arrange our knowledge of the East, to co-ordinate fragmentary and isolated ideas and facts, to find their positions in relation to each other and fit them together, and thus to arrive eventually at a scheme of Eastern life and history which should be no less sure and consistent, and far more wonderful, than the history of European civilization. Mohl's *Rapports Annuels* are a series of ascending steps in this direction. In each of them (except on the few occasions when he devotes a whole report to an account of the rise and progress of the Société Asiatique or to the results of recent travel) he surveys the whole field of Eastern learning, enumerates with marvellous completeness the works that have been issued during the preceding year in every branch of Oriental studies, gives a brief account of the character of the principal works and their place in relation to other works in the same subject, and points out what is most urgently needed in each department; in short, inspects the work of all sections of Orientalists, shows what has been gained, and what is still to be done. It is a matter for reasonable wonder how one man could accomplish all this; and Mohl's verdict on many subjects might be questioned. He was a fine Persian and Chinese scholar, and on these branches of learning he needed no help; but on other subjects he had only that general knowledge which belonged to all the pupils of the great Parisian school of Eastern studies at the beginning of this century. That general learning, however, joined to the constant influence of a renowned circle of Oriental scholars, whose friendly counsel was always at the service of their colleague, was sufficient to direct to the truest ends the naturally fine critical faculty with which Mohl was endowed. No one who reads these reports can fail to be struck with the peculiarly clear perception of the relative value of different portions of research, the comprehensive grasp of Orientalism as a whole, and the accurate placing of each individual part within the whole, which will be found in their pages. Not less remarkable is the sound good sense which rebukes all useless pedantry, and teaches that all good work is subordinated to an end, that end being, not the display of the author's learning, but the diffusion of a right knowledge of the author's subject among the largest possible number of readers, with a view to a general and comprehensive understanding of the history and life of the East. It is in this spirit that Mohl is constantly urging the necessity of translations, and complaining of the increasing practice among German scholars of publishing Oriental texts without translations, and, still worse, of inserting in German works quotations in Arabic or Sanskrit character without giving any rendering of them. This last is a perfectly gratuitous interruption to the average reader, but the publication of a text without translation must certainly be excused when the work is a large one, and the editor has not time to execute the double task. Undoubtedly the French plan of publishing both text and rendering on the same page is the more excellent way; but it must be remembered that if we had to wait for the admirably perfect issues of the French presses for all Oriental authors, we should not possess a quarter of the invaluable authorities which now stand on our shelves, and which are owing mainly to German activity. Nevertheless Mohl showed his usual good sense in his protest against the isolation of texts without translations, and every one who, like him, has the cause of Oriental studies at heart must join in his efforts to give the great authors of the Eastern world a wider audience than the narrow circle of the initiated.

Turning over these pages, one cannot but compare the history they narrate to the revival of letters in the fifteenth century. Mohl's chronicle extends over the golden age of Oriental studies. A new life had been imparted to the wise men of the East. The French expedition had opened up Egypt, and Champollion and Wilkinson had discovered and explained the mysteries of the hieroglyphs; India had been made at last the subject of many researches by the servants of the East India Company, and two societies for publishing Oriental works had been established in London; Sir William Jones and Sir John Malcolm had popularized Persia; Professor Wilson had produced a great development in Sanskrit learning; De Sacy had given a stimulus to the study of Arabic which has never since died; Bopp had founded the science of comparative philology. In 1840, when Mohl took up the pen of chronicler, the fruits of these masters' examples were growing and multiplying. From all sides editions of unpublished authors; memoirs on obscure points of Oriental literature, history, or religion; grammars, dictionaries, chrestomathies; works on every branch of Eastern lore, which are now our leading authorities, and are likely so to remain, kept pouring into the library of the Société Asiatique, and taxed to the utmost the energy of the secretary-chronicler. And, as the reports went on, more discoveries, new fields of exploration, came to light. In these annual surveys we read the whole history of Assyrian discovery, the first labours of Botta, then the excavations of Sir A. H. Layard, the interpretation of the Behistun inscription by Sir Henry Rawlinson, the discoveries of Place and Fresnel and Oppert. Every step in the gradual progress of Assyrian research can be traced here. Mohl was indefatigable in his efforts to secure the encouragement of the French Government for Assyrian discoveries, and he dwells in every report on the immense importance of those discoveries, on the wonderful and seemingly inexhaustible treasures of the valley of the Euphrates and Tigris, and on the necessity for public encouragement and support if the excavations were to go on. There is so full and interesting a history of Assyrian discovery in Mohl's *Rapports* that it was quite needless for Professor Max Müller, in the biographical notice prefixed to these volumes, to recapitulate and emphasize the facts. If the reading public are generally under the impression that Sir A. H. Layard was the first discoverer of Assyrian remains, it is only because, as Mohl himself frequently pointed out with regret, anybody could buy Sir A. H. Layard's book, whereas Botta, the original discoverer of Nineveh, was fated to have his discoveries published by the French Government in so magnificent and costly a form that the very scholars who afterwards explored Nineveh could not buy the *Monument de Ninive*, whilst the vast body of readers who marvelled over Sir A. H. Layard's book of course never saw its French rival. All Eastern scholars, however, are perfectly acquainted with the value and the priority of M. Botta's discoveries,

* *Vingt-sept ans d'histoire des études orientales: rapports faits à la Société Asiatique de Paris de* 1840 à 1867. Par Jules Mohl, membre de l'Institut, secrétaire de la Société Asiatique. Ouvrage publié par sa veuve. 2 vols. Paris: Reinwald.

and also with the ignorant and fatuitous manner in which his Government treated him; and there was really no necessity for Professor Max Müller to excite himself about what he apparently considers the undeserved reputations of Layard and Rawlinson. It would have been better if he had devoted his pages to a clearer and more detailed portrait of the scholar whose life he has sketched with a somewhat uncertain hand. No one can write more charmingly than Professor Max Müller; and it is no small disappointment to find how little he has made of so fine a subject as the biography of Jules Mohl. Scarcely less surprising is the weak and perfunctory character of M. Renan's preface, which is apparently merely a poor abstract of his much more satisfactory *éloge* published shortly after Mohl's death.

A peculiarly interesting part of these volumes consists of biographical notices of the great scholars from whom Mohl learned, or with whom he worked, during the golden age of Oriental letters. Some of these obituaries are written with remarkable tact and grace, and in some we can trace the hand of a man sorrowing for a close friend. Such is the long notice of Burnouf, to whom Mohl gave the whole of his annual *brochure*, for he had not the heart to write or think of anything but the loss which he, in common with all scholars, but above others, had suffered. The notice of Fresnel is a fine example of Mohl's tact; for the impulsive life of the brilliant writer of the *Letters on the Arabs before Islam* needed a delicate hand to draw it truthfully yet tenderly. Another biography well worthy of its subject, and remarkable for its grace, is that on Von Hammer. Many others might be cited—H. H. Wilson, Gesenius, Cureton, Schlegel—but the bare citation is useless. Every one who takes an interest in the history of Oriental literature and the lives of scholars will find a real charm in these *Rapports* of Jules Mohl. They deal with a great epoch in Oriental research, and they chronicle it worthily.

GERMAN LITERATURE.

AFTER an interval of eleven years, the biography of Blücher's great chief of the Staff (1), left incomplete by the death of Dr. Pertz, is resumed by Herr Delbrück, with every prospect of being brought to a satisfactory conclusion. It would indeed have been a subject for regret if the history of one of the chief captains of his time had been interrupted at the most eventful period of his career. The third volume had brought the narrative down to the expulsion of the French from Germany in 1813; the new one describes Gneisenau's part in the campaigns of 1814 and 1815, this being the part of his career most interesting to English readers, from the relations into which it brought him with Wellington. It is seldom that the life of a great strategist is thus written by two civilians, and Herr Delbrück's share of the work, no less than his predecessor's, illustrates both the advantages and disadvantages of an unprofessional biographer. On the one hand, he seldom appears to have a perfectly firm grasp of his subject, and many important details are dismissed with undue brevity. On the other hand, the work is free from the aridity of professional writers, the narrative is flexible and continuous, and due attention is given to political as well as to merely military considerations. The account of the campaign of 1814 is necessarily written from a Prussian point of view, and serves in some degree as an answer to the attempt in Metternich's memoirs to rehabilitate Prince Schwarzenberg and the Austrian operations in general. It is some presumption of its accuracy that Napoleon, rather than Gneisenau, appears as the hero of the story. The controversy on the respective shares of the English and Prussian armies in the Waterloo campaign is treated by Herr Delbrück with exemplary fairness. He virtually censures Wellington for having failed to support Blücher on the day of Ligny, and rates him as essentially a general of the old school; but he renders full justice to his masterly conduct of a defensive like that assumed by the English army at Waterloo, and is free from any tendency to disparage English troops and English commanders as such. Throughout his history Wellington appears as the soldier statesman, who has wider views than the simple winning of battles; Gneisenau as the mere soldier, though a consummate one. Such was in fact the relation between the two, and it is not surprising that it should have led to an irreparable breach, and that Gneisenau's correspondence should exhibit many traces of irritation against his coadjutor. A fifth volume will complete the work.

Herr Caro's essay on the League of Canterbury (2) concluded between the Emperor Sigismund and Henry V. of England is substantially a vindication of the former against the imputation of treachery to France. Herr Caro thinks that France drove Sigismund into an alliance with England; that his intentions were wholly upright at first; and that he is chiefly censurable for instability, not with respect to his old ally, but to his new one, who never derived any real benefit from the treaty. Henry, however, showed himself pretty well able to dispense with Sigismund's help, and the visit of the latter to England is chiefly memorable for the influence which it exercised upon the deliberations of the Council of Constance.

Georg Friedrich, Prince of Waldeck (3), was an intimate friend of William III., one of the most attractive parts of whose generally cold and reserved nature is admitted to have been the affection he entertained for the few of whose disinterested fidelity he was assured. No one merited his esteem more than Waldeck, whose integrity and soundness of judgment—although his parts were rather solid than shining—caused him to be frequently selected as William's representative, both in civil and military affairs. The correspondence published in Dr. Müller's second volume relates principally to military operations in the Low Countries during William's absence in England, from the Revolution to 1692. It is prefaced by an able and interesting essay from the editor's pen on the coalition against France formed under William's influence between 1684 and 1689. The more interesting portions of the work to an English reader are, however, the occasional glimpses of English affairs in William's letters. He protests, for instance, his extreme disinclination to accept the throne of England, *quoyque je prévois fort bien que le monde en jugera autrement.*

The first part of an interesting review of Prussian administration between the death of Frederick the Great and the outbreak of the War of Liberation (4) is chiefly devoted to the educational and religious alterations which ensued on the accession of Frederick William II. Frederick William, the reverse of his great uncle in everything good and bad, was, although a dissolute prince, greatly addicted to religious mysticism, and sympathized with the contemporary reaction against the *Aufklärung* which found expression in secret Societies of the Illuminati, Freemasonry, and the Rosicrucian brotherhood. These tendencies were represented by his Minister Wöllner, a curious compound of craft and fanaticism, who overcame his rival Zedlitz, and gave Prussian public education the unfortunate direction which, by undermining the moral vigour of the nation, so largely contributed to the ignoble part performed by Prussia during the first years of the French Revolution. The economical administration of the country was also feeble and wasteful; and, on the whole, no reign in Prussian history is so unsatisfactory as Frederick William's, though few sovereigns have been better intentioned.

The last part of the general historical series edited by Professor Oncken (5) contains portions of Professor Hertzberg's History of the Roman Empire and Professor Kugler's History of the Crusades. Both are sound and useful manuals of information, with no especial literary pretensions. Compared with similar popular publications in former times, the most remarkable advance is perhaps in the number and beauty of the illustrations, which prove how useful an auxiliary art may be to history.

The Poniatowski (6) are one of the most interesting of celebrated families, and M. Szymanowski's essay on their genealogy is more worthy of general attention than the majority of such investigations. He thinks that they are not improbably an offshoot of the Italian House of Torelli. The most entertaining part of his work, however, is a translation of a curious letter addressed to his son by John Firlej, treasurer of King Sigismund about the beginning of the seventeenth century, in elucidation of the status of the Polish nobility, and in deprecation of the unpatriotic practice of soliciting foreign titles.

A work on European statistics (7), if accurate, cannot fail to possess a certain value, and much useful information may without doubt be derived from Herr Krümmel's volume on the subject, which is nevertheless not handled in such a manner as to suggest a thorough mastery of the subject. The arrangement seems confused, and many of the details irrelevant, and we can hardly believe that the posthumous papers of the late distinguished geographer Peschel, stated to have been employed in the preparation of the work, have really contributed much towards it. The strictly statistical part is generally better than the sketches of physical geography, which, though full of interesting details, appear rambling and capricious. The colonies and foreign possessions of the European States being included as well as the mother-countries, and Great Britain falling within the scope of the first volume, great part of this is occupied with regions beyond the limits of Europe.

Dr. von Thanhoffer's (8) useful work on the microscope is especially intended for medical men, and accordingly treats not only of the construction and application of the instrument, but of several branches of anatomy and histology.

A bibliography of books relating to Icelandic and Norse literature, by T. Möbius (9), is a continuation of a similar work, bringing the subject down to 1855. Like its predecessor, it is invaluable to students of the Northern languages and literatures, especially as it is classified according to subject.

Theodore, Bishop of Mopsuestia (10), one of the most influential

n Scripture in the early Church, flourished in the latter part of the fourth and the first quarter of the fifth century. He had been a fellow-student with Chrysostom, and himself became the head of the theological school of Antioch, then at the zenith of its reputation. His method of interpretation was allegorical, and bore a strong resemblance to Origen's. Like Origen, he incurred the suspicion of heresy, and although he retained his bishopric during his life, his writings were condemned after his death, and have almost all perished. This severe treatment was owing to the use made of them by the Nestorians, who regarded Theodore as their principal authority. Dr. Kihn's account of him is interesting, and as impartial as can be expected from a Roman Catholic divine; but the principal novelty of his work is the examination he has bestowed upon the Western representative of Theodore's ideas, Junilius Africanus, the author of the *Instituta regularia divinæ legis*. Junilius has been hitherto supposed to have been an African bishop. Dr. Kihn, however, maintains, and apparently on good grounds, that he was an official holding high rank at the Court of Constantinople, and that his work was composed about the year 551. It is principally important as a summary of the theology of Theodore, derived mediately through the great Nestorian school established under Persian protection at Nisibis, where Theodore's writings were used as text-books. Dr. Kihn seems to make this point out very clearly, especially by a comparison of Theodore's canon of Scripture with that recognized by Junilius. The text of the latter's work is appended.

A History of Jewish Culture, by Otto Henne-Am Rhyn (11), although a volume of no great literary merit, and indeed bearing internal evidence of having been hastily put together for circulation under favour of the present anti-Jewish agitation in Germany, is nevertheless useful as a compendium of information not readily accessible in a popular form. The post-Biblical portion of the work, to which this remark principally applies, seems to be mainly an abridgment of Grätz's great history. The author could not have chosen a better guide, especially as he is in no danger of imbibing his somewhat exclusive and Rabbinical spirit. His own tone is tolerably impartial, although some of his observations on the status of Jews in Germany indicate an imperfect mastery of the principles of civil and religious liberty. It is fair to consider, however, that Jews have not trebled their numbers within the last eighteen years in London, as they appear to have done in Berlin.

Dr. Berger's collection of the fragments of Eratosthenes (12) is accompanied with copious disquisitions, and amounts to a restoration of the geographer's work, as far as practicable. That it should be practicable at all is principally due to Eratosthenes's inveterate adversary, Strabo, who, in attacking his cosmography and his mathematics, has preserved considerable portions of his treatise. Dr. Berger has arranged these, together with the fragments obtained from quotations or references by other writers, according to their subject, and has thus obtained materials for a series of dissertations both on Eratosthenes's views on mathematical geography and on his accounts of the particular countries he undertook to describe. The work is thus more than an edition of the remains of Eratosthenes, and is almost equivalent to a treatise on the geographical knowledge possessed by the ancients in his day and in that of his principal critics, Hipparchus and Strabo.

Otto Hense's volume of Sophoclean studies (13) is intended as the precursor of a complete critical edition, and is almost entirely confined to the *Trachiniæ*. The notes are chiefly philological, but points connected with the economy of the drama and the art of Sophocles in general are occasionally discussed in such a manner as to show that Herr Hense is something more than a merely textual critic. He lays, in fact, great stress on the necessity of a thorough comprehension of Sophocles as an artist as a qualification for the study of his phraseology, and is perhaps inclined to rely even too much upon this higher criticism.

It would have been creditable to England if Mr. Blaydes's edition of Aristophanes (14) had been produced in this country. Since this was not to be, it is at all events flattering that Germany should have for once imported an English scholar whose work will bear comparison with any produced in the land of Meineke and Ritschl. Judging from the specimen before us, Mr. Blaydes's edition will want nothing to make it a perfect model of the style in which Greek plays should be edited. A copious critical commentary is placed at the foot of the page; a still more ample explanatory and illustrated one is subjoined to the text. The student and the scholar alike are amply provided for, and it is very satisfactory to learn that the remaining plays of Aristophanes are to be edited upon the same plan.

The first part of Herr Milchsack's work on the Resurrection and Passion miracle plays (15) contains the text of an Easter play derived from various MSS., and arranged in parallel columns, so as to illustrate its gradual development from the most primitive forms. An introduction is prefixed reviewing the various theories respecting the origin and design of miracle plays, whether purely Christian institutions, designed from the first for edification, or survivals of ancient heathen spectacles converted to the purposes of the Church.

Dr. Elze's judgment is sounder than that of most professional emendators of Shakspeare's text (16); and it is not too much to say that, out of nearly a hundred passages in the poet and his contemporaries discussed in his *Notes on Elizabethan Dramatists*, there is not one where his opinion is not entitled to respectful consideration. His mind is rather judicial than original, and hence perhaps his review of the various opinions advanced by other commentators in disputed passages is more valuable than his independent suggestions. The copiousness and appositeness of his illustrations from passages in Shakspeare's contemporaries add greatly to the importance of his work. It is to be wished that he would publish an edition of the pseudo-Shaksperian plays, "the rank corruption of which," he says, "justifies a larger tether than is granted elsewhere."

There is a great deal of *esprit* in Herr E. Hermann's attempt to prove that the *Midsummer Night's Dream* (17) is in some degree a literary satire directed against Marlowe, Greene, and Nash; but not too much common sense. That bad poets are ridiculed in Bottom's mock play is plain enough; but, if Shakspeare had really entertained the polemic purpose attributed to him, the purport of his allusions would have been equally plain; and Herr Hermann's endeavour to prove Nash's *Summer's Last Will* to be a formal reply to the *Midsummer Night's Dream* is even more far-fetched, though some occasional references and allusions may be admitted. The best part of the book is Herr Hermann's essay on the date of the play, which he ascribes with much probability to 1595.

The aphoristic is the most difficult of all styles of composition, for it allows no room for mediocrity. It requires no small self-confidence for a writer to appear before the public with the profession of having made seven hundred and two remarks sufficiently out of the common to justify their publication in an aphoristic form. Many of Herr von Oertzen's (18) "prose epigrams" are not only just, but pointed; but, although they might have enlivened an essay, they will seldom bear entire isolation from any kind of context.

The fame of Mr. Morley's *English Men of Letters* (19) has reached Germany; and Herr L. Katscher is performing a really acceptable service to German literature by the free translations, enriched with notes, which are appearing under his direction. His version of Andersen (20) is also very good, and the introductory biographical notice is very well done.

Im Schillingshof (21) may not be the best of Miss Marlitt's novels, and perhaps even indicates that she has reached the stage at which most prolific novel-writers inevitably arrive, when the contrivance of plot and incident becomes to a certain extent a manufacture. Regarded from this point of view, it is nevertheless a very creditable piece of work. Attention is excited from the first, and ably maintained throughout; the style is clear, the characters are natural, and many of the scenes are powerful. The idea on which it is built is the joint occupation by two families of a house divided into two portions connected by a secret door, the existence of which is known to the head of one of the families only. He profits by his knowledge to learn what is going on in the residence of his neighbours, who are naturally bewildered at finding their most intimate affairs divulged. At length the secret is discovered by the innocent incautiousness of his child. The scene in which this occurs is powerfully conceived and written. A rapacious and intriguing Roman Catholic priest—too much like some of the characters to whom Miss Marlitt has on previous occasions accustomed us—plays a considerable part in the story.

"A Secret Despatch," by Robert Byr (22), possesses at all events the negative merit, rare in three-volume German novels, of being neither overdone with long speeches nor with long soliloquies by the writer in his own person. The dialogue, in fact, is unusually animated, and the novel is mostly dialogue.

Spielhagen is not a master of the art of concise narrative; and his last work, *Quisisana* (23), though designed as a novelette, extends to no inconsiderable length. It is indeed much too elaborate for the materials, the characters and the incidents being alike almost devoid of interest. The chief originality consists in the ingenious method of suicide adopted by the hero, who, having been

(23) *Quisisana: Novelle.* Von F. Spielhagen. Leipzig: Staacke. London: Williams & Norgate.

jilted by the heroine, wilfully contracts an incurable heart disease by sleeping on his left side, in defiance of the family doctor. Before dying he composes a congratulatory telegram to the young lady, who is staying at the Hôtel Quisisana at Capri—hence the title of the book. These incidents read like a burlesque on a bad French novel, but have neither the liveliness of French novels nor of burlesque.

Helmar (24), by Fanny Lewald, is a romance in the form of an autobiography, professing to record the history of an artist. It is natural, but tame, and might almost pass for the *bonâ fide* narrative it represents itself to be. "The Riddles of Life" (25), by E. Juncker, is, on the other hand, emotional and sentimental, and graced by such incidents as the transfusion of blood from the veins of the hero to those of the heroine, with a tempest to bring about the catastrophe. Brachvogel's "Battle of the Demons" (26) is an ordinary circulating library novel. "From the Cradle to the Grave," by E. Valentin (27), is a pretty story, of no great pretensions, but well adapted for use by English students of the German language, the more especially as the scene is laid in this country.

The *Rundschau* (28) concludes Herr Rudolph Lindau's excellent Anglo-Japanese story, and has one of those pretty finished tales of modern Italian life which Paul Heyse has acclimatized in German literature. "Lazy Beppo" is short, but a perfect picture in its way. Another brief but agreeable contribution is a paper by Friedländer on funeral ceremonies in Imperial Rome, illustrative of the lavish expenditure which frequently prevailed on such occasions. It is a chapter from the forthcoming third volume of his *Sittengeschichte Roms*. A criticism on Brahms, by Louis Ehlert, notwithstanding professions of strict impartiality, bestows as much praise on the composer as even an artist's appetite can well require. Mme. de Rémusat's Memoirs are very fairly reviewed by Karl Hillebrand, who uses her portrait of Napoleon as the groundwork for a vigorous delineation by himself.

THE BRADLAUGH DEBATE.

THE remarkable division in the BRADLAUGH case expresses perhaps the feeling and instinct of the House of Commons quite as much as its deliberate judgment on the legal and constitutional question. It was not through enthusiasm for any interpretation of ambiguous statutes that the majority cheered loudly for several minutes when the result was announced. The repugnance which is felt for the publications and acts of Mr. BRADLAUGH requires no explanation; but his moral and theological aberrations had no real bearings on the merits of the case. Every fresh stage in the controversy has been more embarrassing than the last. It is greatly to be regretted that the issues raised by Mr. BRADLAUGH himself and by Sir DRUMMOND WOLFF should have become to a certain extent party questions, though only one of the two parties is united. That the law of the case with respect both to oaths and to affirmations is doubtful is sufficiently proved by the division of opinion among lawyers both within and without the House of Commons. One Select Committee reported against the claim to make affirmation, and another against the claim to take the oath; and the second Committee, disregarding the limits of the reference under which it acted, recommended the House to overrule the judgment of the first. The supporters of Mr. LABOUCHERE's motion may be further divided into two classes. Some of them, including Mr. LABOUCHERE himself, who contended that the House could legally allow the affirmation, were perfectly consistent in voting for the motion. Those, on the other hand, who professed uncertainty as to the law defended a wholly untenable position in appealing from the House of Commons to the Courts of Law. Conflicts between the Houses of Parliament and the Bench are sometimes unavoidable; but they have only occurred at long intervals, and they ought not to be deliberately provoked. It was absurd to propose that the House should voluntarily assume the position of a litigant who commits a nominal trespass for the purpose of raising a question of title. Members who voted for the claim of affirmation without a strong conviction that it might be legally allowed challenged a judicial condemnation, not merely of Mr. BRADLAUGH, but of the House of Commons. It would be impossible to impose the statutory penalty in an action by an informer, except on the ground that the House of Commons had infringed the law. The further proceedings would for a considerable time leave the question in suspense. A judgment for the plaintiff in a *qui tam* action would be brought before the Court *in banc;* and, if it were affirmed, before the Court of Appeal. The case might ultimately be taken to the House of Lords, which would be required to decide whether a member of the House of Commons had, in accordance with a resolution of the House, committed a breach of law and forfeited his seat. There is a similar objection to the proposal that the question should be decided on a motion for a *habeas corpus*.

The warmth of feeling and of language imported into a debate which ought to have been strictly argumentative was unfortunate, though it may have been inevitable. Such a speech as that of Alderman FOWLER, who seconded the amendment, may explain, though it cannot excuse, the characteristic bitterness with which Mr. BRIGHT always discusses matters in any way connected with religion. The demerits of Mr. BRADLAUGH's opinions can only form a reason for excluding him from the House on the assumption that, as Mr. BRIGHT said, a new test of theism is to be casually established. The risk and inconvenience of such an innovation would admit of easy proof. The only faith which has at any time been legally or officially recognized in England is not theism, but Christianity. The House of Commons has no aptitude for investigating or appreciating the modern heresies of Positivists or Agnostics. At this moment a majority of its members, instead of regarding Mr. BRADLAUGH's intrusion with horror, probably wish that he had complied with the ordinary form and taken his seat in silence. On the present occasion his opponents eagerly disclaim any pretension to inquire into the opinions of any member who abstains from forcing them on the notice of the House; but if unbelief in any case excludes a member, it may be hereafter contended that the disqualification ought to be discovered even when it is not publicly avowed. An obvious mode of escaping from the difficulty would be a declaratory Act; but it is doubtful whether such a measure would pass the House of Lords. The most awkward contrivance was to pursue a course which might perhaps be illegal, with the purpose of transferring the responsibility of a decision from the House of Commons to the Courts of Law. Mr. GLADSTONE, though he supported Mr. LABOUCHERE's motion, argued in favour of administering, not the affirmation, but the oath. If his advice had been followed, a question might possibly still have been raised as to Mr. BRADLAUGH's legal competence to sit or vote; but there can be little doubt that the decision of the House would have been supported by the High Court of Justice. No speaker in the debate explained so clearly the nature and importance of the issue raised by the motion and amendment. His contention that in administering the oath the House discharged a merely ministerial function might have deserved consideration at an earlier stage of the question. Literal compliance with the directions of a statute might be dissociated from moral responsibility if the law allowed no exercise of discretion. In the less technical part of his speech Mr. GLADSTONE urged more persuasively and less pugnaciously than Mr. BRIGHT the embarrassments which might ensue on an attempt to define and stigmatize atheism.

Sir DRUMMOND WOLFF, though his intervention in the BRADLAUGH case has been in one sense almost unanimously approved by the House of Commons, has been the cause of much trouble and embarrassment. It is a sufficient personal apology that the House has both treated the matter seriously and made it the subject of a laborious and elaborate investigation. It may be fairly or plausibly asserted that so grave a question ought not to have been evaded or passed over in silence; yet, if Sir DRUMMOND WOLFF had been accidentally detained on his way to the House, no moral, religious, or constitutional issue would have been raised. It had not occurred to the SPEAKER, who was aware of all the circumstances, to direct that Mr. BRADLAUGH should not be allowed to take the oath. His application to affirm had already, by a st[illegible] interpretation of a statute, been rejected by the House on the Report of a divided Committee. His unnecessary declaration that the religious sanction of the oath was to him a meaningless form mainly created the complications which have since ensued; but it was well known that many members of the present and former Parliaments held the same opinions with Mr. BRADLAUGH. To them also the religious sanction was unmeaning, though they

had the good sense or good taste to abstain from thrusting their unbelief on public notice. In a similar case a Court of Law would probably reject the testimony of the witness; but it would be able under the statute to allow him the alternative course of making an affirmation. A promissory oath, notwithstanding its doubtful utility, is alleged by Mr. BRADLAUGH's opponents to stand on the same footing with the oath of a witness, as long as it is prescribed by law.

Throughout the debates the judgment of some highly respectable members appeared to be warped by their intelligible dislike of Mr. BRADLAUGH's opinions; but no religious belief or unbelief affects the eligibility of a member. Tests which have since been repealed were imposed for the purpose of excluding persons who held opinions which were considered dangerous to the State. The oath of allegiance was aimed at the partisans of the Pretender, and the oath of supremacy at the adherents of the Pope. The sanctions of the oath were those which were universally admitted to be binding; and they were not adopted with the design that they should operate as tests. Roman Catholics of course refused to take the oath of supremacy; but they could have no objection either to appeal to a Supreme Power, or to profess the true faith of a Christian. The effect of the sanction in becoming a supplementary test was first perceived in the case of the Jews, whose case had never been thought of when the oath was framed. Mr. BRADLAUGH is prevented from taking his seat in the House on similar grounds, though the objection is now made, not by himself, but by his adversaries. The religious formula was not framed on the supposition that it would be in any circumstances refused. The simplest remedy would have been to allow an affirmation to be substituted for an oath, not, as Mr. LABOUCHERE proposed, by resolution of the House, but by Act of Parliament; but it is not certain that such a measure would be passed even by the House of Commons. The assumption by the House of a power to prohibit in the present case the administration of the oath may probably not be inconsistent with the analogy of its practice, *though it is not supported by direct precedent*; but Mr. BRADLAUGH is left in a different position from O'CONNELL when he was returned for Clare, and from Baron ROTHSCHILD, who was for several years member for the City of London without taking his seat. In both cases the House had only judicial notice of the fact that the member had not taken the oath, and it was possible that at any time he might change his mind and conform. Mr. BRADLAUGH's compliance with the requisition of the law depends on the improbable contingency of his becoming a convert to sounder doctrines. The expulsion of a member on the ground of religion or irreligion would be within the power of the House, but scarcely within its practical competence. In the modern law and practice of England no conceivable heresy creates political disqualification; and it would be impossible, even if it were advisable, to establish a new system of disabilities. It is true that the House of Commons cannot be compelled to assign reasons for the exercise of its power; but, if Mr. BRADLAUGH's seat were declared vacant, a new writ must be issued; and it is quite possible that the electors of Northampton might repeat their former choice. The House would not, as in WILKES's case, assert the power of permanently disqualifying a member; but the process of imposing conditions on the right of taking the oath, and of making non-compliance an excuse for exclusion, might be indefinitely repeated. Mr. BRADLAUGH could never have been so troublesome if he had been admitted to take his seat. The confused proceedings of Wednesday last justify the uneasiness which is felt by thoughtful politicians, and which will certainly not be diminished by Mr. GLADSTONE's subsequent persistence in declining the responsibilities of his position. In further discussions it may be hoped that he will assume his proper position as adviser and guide of the House. He showed doubtful judgment in recognizing Sir STAFFORD NORTHCOTE as leader of a majority which included many Ministerial supporters.

ABDICATION OF THE GOVERNMENT.

IT would be idle to pretend that the scene of Wednesday last in the House of Commons, with its sequel, has not brought about a situation of great embarrassment. The conduct of Mr. BRADLAUGH on that occasion was probably calculated and arranged for the purpose of producing such a situation, and was characterized by the peculiar kind of ability of which no one disputes him the possession. His first step involved the House in the difficulty of either hearing him or deliberately refusing him a hearing, and though Mr. GLADSTONE afterwards hinted that there was no necessity for adopting the former alternative, he was careful to give no advice to that effect. The permission accorded to Mr. BRADLAUGH was one which gave a great advantage to a clever man and a practised speaker. He was careful to advance no argument. But his rhetoric about his own and the people's rights was well calculated to catch the applause of democratic societies; his defence of the "other names" which had been introduced threw an air of chivalry over his attitude, and this was judiciously enhanced by his posing as "one man against six "hundred." In the singular series of alternate removals and reappearances in which he was subsequently the central figure something of this dignified air was lost, though it was not wholly destroyed. But it was not so much the actual passage of arms which ended in Mr. BRADLAUGH's incarceration, as the incarceration itself, that constituted the difficulty. It was terminated on the following day by a motion of Sir STAFFORD NORTHCOTE's, who was reasonably desirous to hasten the finale, and to relinquish the unnatural part which had been forced upon him of leading the House with a minority of a hundred and without official position. But Mr. BRADLAUGH's friends have threatened a repetition of the scene of Wednesday; and even Mr. GLADSTONE, in his own tortuous language, has announced that he does not consider such conduct a necessary vindication of what he does consider to be Mr. BRADLAUGH's rights. The question How is all this to end? naturally forces itself upon the attention, not the less that there was nothing surprising in the mere fact of the difficulty, which was an obvious result of the division of Tuesday night. We necessarily write in ignorance of what may or may not have occurred at yesterday's sitting of the House.

That which is really surprising in the matter is the extraordinary line of conduct which the PRIME MINISTER has thought it proper to adopt. We have before now pointed out that the one desire of the Government throughout this matter has apparently been to avoid responsibility. But for this desire, to which they have clung with a desperate tenacity contrasting curiously with their irresolution in some other matters, the affair never would have got into its present muddle. But at its every stage the determination of the Ministry not to take a definite line has been evident. From this came the reference to the two Committees, the extraordinary *coda* tacked, obviously under Government inspiration, to the finding of the second, and the attitude of Ministers in the actual debate. But the conduct of Mr. GLADSTONE on Wednesday was the most singular embodiment of this determination not to lead that has yet been seen. That it was deliberately adopted cannot be doubted. One of the ingenious persons who brew Parliamentary small beer for the consumption of the public has informed the world that Mr. GLADSTONE appeared in the House with gloves and a stick, and that his appearance with gloves and a stick was in the penultimate Parliament the signal that he did not mean to perform the part of general. These equipments are apparently Mr. GLADSTONE's *Tarnkappe*, or recipe of fern-seed, the sign of intended incognito and invisibility, which his followers know how to respect. Accordingly, when Mr. BRADLAUGH appeared to force the hand of the House Mr. GLADSTONE made no sign. He was waited for, he was even called by name. The SPEAKER, anxious to have the definite commands of the House in a matter so weighty, made a perhaps formally unnecessary appeal for instructions. But Mr. GLADSTONE remained inactive. This being the case, Sir STAFFORD NORTHCOTE had at last to step into the breach, and for the remainder of the battle to officiate as general. Then, and not till then, did Mr. GLADSTONE open his mouth, to say practically that he had washed his hands of the business. He did not oppose Sir STAFFORD's recommendations; on the contrary, he supported them with his voice and his vote. But he would have nothing to do with the initiative, and practically abdicated for the time his functions as leader of the House for those of the leader of Opposition, acquiescing in, but not proposing, the steps taken for the restoration of order and the defence of the authority of the House. By this curious conduct he indeed avoided the charge of conniving at rebellion against the authority of the SPEAKER. But at the same

time he avoided still more dexterously the charge of inflicting harsh measures against Mr. BRADLAUGH. This responsibility, like the responsibility in all previous stages of this business, has been shifted upon the shoulders of the Opposition. The odium of those frequently necessary measures which have to be taken for enforcing the authority of the House is justly supposed to rest upon Ministers as an incident of the general responsibilities of office. It has remained for Mr. GLADSTONE to devise a means of evading this unpleasant concomitant of the pleasures of Downing Street. The office of executioner is not a grateful one, and it is doubtless very satisfactory to be able to delegate it, with the additional advantage of placing it in the hands of a political adversary.

We have called this proceeding an act of abdication, and we see no milder term which can be applied to it. Doubtless Mr. GLADSTONE's position—in consequence, let it be remembered, of his own action—was a delicate one, and Sir STAFFORD NORTHCOTE, with a generosity contrasting singularly with the attitude of the Government, fully recognized this. But it seems impossible to contend that his action, or rather inaction, was legitimated by the circumstances. Mr. GLADSTONE seems to wish to take the vote of Tuesday night as a kind of partial vote of want of confidence, justifying a partial resignation. The doctrine is, no doubt, an exceedingly convenient one, and, carried a little further, would make it almost impossible for a Government ever to meet with serious disaster. But it is not one which can be for a moment accepted as fair, or the acceptance of which can be regarded as for the public welfare. No Government can be permitted in the case of important public questions to wash their hands, to stand aside and to say, "Settle it among yourselves." Such conduct must be set down either to childish petulance, to incapacity for management, or else to an elaborate design to evade the responsibilities of office. It might indeed be contended that no one of these three motives is wholly absent in the present instance, and certainly no one of them is particularly creditable to the Government. Still less creditable perhaps was Mr. GLADSTONE's jaunty remark on Thursday that, "only twenty-four hours" having elapsed, the Ministry had not yet thought it worth while to consider the situation. Had they honestly met the case instead of adopting a course which was almost equivalent to moving "the previous "question," there might be some shadow of excuse for the attitude of dudgeon assumed on Wednesday. But, in face of their actual conduct, the vote of the House must be taken as a direct appeal to the Government to propose a settlement of the difficulty, instead of a way of avoiding it. To this conclusion they must come sooner or later; nor will it be always possible to make Mr. LABOUCHERE and Mr. Serjeant SIMON stalking-horses for action which they dare not take, and Sir STAFFORD NORTHCOTE the scapegoat for responsibility which they are afraid to incur. The extreme awkwardness of the question in its present state everybody admits; but the Government cannot in the long run escape the task which they have hitherto so resolutely avoided. The conduct of the Opposition hitherto, if it has lacked "opportunism" to some extent, has been strictly within its rights. It has sought solely to ascertain the law and the facts, and then to act on both. The conduct of the Government, on the other hand, has been based apparently on a desire to avoid action of any kind. In this, as in the more overt proceeding of Wednesday, they have simply abdicated their functions. It is open to the Government, if they think it absolutely necessary to seat Mr. BRADLAUGH, either to propose the relaxation of the oath or the definite extension of the affirmation, and in doing either of these things they would, whatever may be thought of the intrinsic merits of either proposal, be resuming and discharging the functions of Government. These they are now refusing to discharge, with the inevitable result of confusion and deadlock. It is idle to charge this state of things on the Opposition or on any member of it; even Mr. BRADLAUGH is only partially to blame for it, because his present attitude is clearly encouraged by the indirect but decided support given him by the Government on Tuesday and since. The Ministry—and the Ministry almost alone—are to blame, and they will continue to bear that blame, unless they make up their mind to take the fence at which they have so long been "craning."

THE DEBATE ON THE BUDGET.

SINCE the introduction of Mr. GLADSTONE's new Budget, its provisions have necessarily had to undergo a considerable change. He was then sanguine enough to expect that a new treaty of commerce with France might be concluded by the middle of August. This expectation he has now had to abandon. The French Government is not to be hurried, and in its critical relations with the Senate cannot afford to have it assumed that it is going to modify in favour of England the tariff which the Senate has not yet approved. The contemplated reduction in the wine duties must therefore be postponed; and if the French are willing to make a treaty of commerce at all, the course taken will probably be that the two Governments will conclude the treaty during the autumn, and that the English Government will apply to Parliament at the beginning of next Session for the requisite authority to carry out the English part of the bargain. We have nothing whatever with which we can bargain except the wine duties, and it is therefore only the wine duties that any future application to Parliament for authority to carry out a treaty with France can affect. Mr. GLADSTONE has gained by his premature dealing with these duties the knowledge that Parliament will heartily support him in reducing them as a means of bargaining with France. The obvious objection that it is very imprudent for a bargainer to disclose all that he has to concede before he begins to bargain is in this case satisfactorily met by the reply that the French know perfectly well that we have only one possible advantage to offer them. But this is not all that Mr. GLADSTONE has gained by laying his proposal at an early date before the public. He has received the criticism he invited, and has had considerations forced upon him which, as he acknowledges, may induce him to change his opinion on some very important points. For some time past there has been a keen contest as to the proper mode of charging duties on wine. According to our present system, introduced when the French treaty was made in 1860, all wine above 26 degrees and up to 40 degrees pays the same duty. The growers and shippers of strong cheap wines complain that this is unfair on them, and Mr. GLADSTONE proposed to make everything fair by having a sliding scale, so that each increasing degree of strength should carry with it a fractional increase of duty. The trade, however, strongly objected to this on account of the minute and vexatious testing to which wines would be subjected. And Mr. GLADSTONE has been so far moved by their appeals to him that he now says that he is prepared to consider whether it would not be better to divide the wines above a certain degree of strength into classes, so that all wines of approximately the same degree of strength should pay the same duty. It is certainly very desirable that Mr. GLADSTONE should have time to enlighten his mind on such a point before he negotiates with France. But it is impossible not to feel some surprise that he should have made his proposals to Parliament without having examined such a matter so exhaustively as to have reached a conclusion which he was prepared to defend against any criticism to which it might be exposed.

It is less surprising that Mr. GLADSTONE should not have foreseen every possible objection that could be made to his plan for taxing beer. How to tax beer so as to do complete justice both to the revenue and the brewers is, as Mr. GLADSTONE asserts, one of the most difficult problems with which he has ever undertaken to deal. Taxing malt is theoretically wrong, as it is taxing the manufactured article beer at too early a stage; but it has the enormous practical advantage that the tax is easily levied, is scarcely ever evaded, and its proper amount can be readily ascertained. If the tax on beer could be imposed when the whole process is finished, there would be no great practical difficulty in levying it. If, for example, the plan adopted in the United States could be followed, and a stamp had to be affixed on every barrel sent out for consumption, the duty could be got in with little risk to the revenue and scarcely any annoyance to the brewers. But the beer drunk in the United States is of one uniform strength, while in England the strength of the beer consumed differs widely, and the English tax is to vary according to the strength of the beer. This strength must therefore be tested, and the only way of testing the strength of beer is to test it while it is in the process of fermentation. How this is to be done is the problem to be solved. The puzzle is so great that Mr. GLADSTONE

stated on Thursday night that even then he was not prepared with a final proposal; but he acknowledged that the brewers had convinced him that, if his original proposal had been adopted, he would be getting a larger revenue than he intended or thought right. Mr. ARTHUR BASS, who spoke with as much knowledge of the subject as any one could possess, put this unintended increase of income at nearly a million and a half sterling. Mr. GLADSTONE did not accept these figures; but he owned that, if he did not wish to take too much money, he must make a concession to the brewers in the direction pointed out by them. The technical form which the change will take will be an alteration in the measurement of the specific gravity of the liquid when it is in the fermenting vats. There were also other minor changes which Mr. GLADSTONE said he was prepared to adopt in deference to the remonstrances of the trade. He was prepared to allow a larger margin for waste, to modify the presumptive charge upon the materials used in brewing, and to take monthly instead of fortnightly payments. He further stated that it had been represented to him that a number of families might combine to brew in a common brewhouse the value of which would not render it liable to duty, and that what he termed Brewing Clubs might thus be established. He proposed therefore to cut the ground from under these jovial institutions, by enacting that the brewing exempted from duty must be brewing upon the premises of each person benefiting by the exemption. All these changes would, he calculated, diminish the revenue which he expects to derive this year from the Beer-tax. But then this year there will be no reduction on the wine duties, so that altogether his surplus will be even larger than he anticipated, and may be even expected to reach something like half a million sterling.

Sir STAFFORD NORTHCOTE, without offering any criticism that could be called captious, objected to the Budget altogether. There was, he thought, no use in having a new Budget at all. He had left behind him a Budget which did not provide any surplus; but then he did not see what good it was to have a surplus. The use to which Mr. GLADSTONE proposed to apply his surplus was to give some possible and hypothetical aid to India. Until the Government knew whether it was going to help India, it was useless to call on the taxpayer to provide money for a purpose for which the money might never be needed. Even if there was to be a new Budget, Sir STAFFORD NORTHCOTE thought that the proposals of Mr. GLADSTONE were open to innumerable objections. He readily owned that, if it was a good thing to abolish the Malt-tax, the credit due to the Government for the proposal was not in any way diminished by the fact that the substitution of a Beer-tax for a Malt-tax has been often suggested. It is easy to make suggestions for financial changes; the difficulty is to find a Ministry that has sufficient courage to shape vague suggestions into a definite scheme for which it makes itself responsible. Nor did Sir STAFFORD NORTHCOTE object to what he called a political budget. It was, he thought, quite fair that the Government should try to please the farmers if it had a fancy to do so. But he prophesied that the farmers would be very much disappointed with the results of this repeal of a tax against which they have long been clamouring; and it must be owned that the precise advantage that farmers expect to derive from the repeal of the Malt-tax has never been placed in any very clear light. Even if the Malt-tax was to be abolished, Sir STAFFORD NORTHCOTE thought that the increase of the Income-tax was not the proper mode of purchasing its abolition. He suggested what he himself would have done had he been in Mr. GLADSTONE'S place. By the payment down of a million sterling a permanent increase of revenue exceeding 300,000*l.* is to be obtained. Sir STAFFORD NORTHCOTE would have borrowed the million and have paid it off in three years with the proceeds of the increased revenue. In making this suggestion, and in arguing that a surplus was useless, Sir STAFFORD NORTHCOTE summed up what may be termed his system of finance as contrasted with that of Mr. GLADSTONE. Sir STAFFORD NORTHCOTE wishes to give the taxpayer the greatest amount of ease which at any moment it is possible to give him. It seems hard on the taxpayer to make him provide a penny beyond what must necessarily be spent, and equally hard to make him pay down a sum that can be easily paid in course of time by instalments. Mr. GLADSTONE thinks not so much of the taxpayer as he exists at any particular moment, but of the national credit which it is the business of the taxpayer at all times to maintain. His maxims are, that there ought always to be a surplus as a sign of the financial strength of the nation, and that each year ought to provide for its own charges. The Income-tax-payer is now the sufferer, and it certainly seems hard on him that he alone should pay for what is to be a general financial improvement. But he must console himself as well as he can with the thought that he supplies the machinery by which Mr. GLADSTONE'S maxims of finance are to prevail.

RUSSIA AND CHINA.

TWO or three years ago the prospect of war between Russia and China might have been regarded by some English politicians not without complacency. A formidable diversion would have removed immediate apprehension of Russian interference in the affairs of Afghanistan. It is probable that the whole disposable force in Central Asia may be required in Kuldja and the neighbouring provinces, though it is still difficult to believe that the Chinese troops will venture on an encounter with an enemy so greatly superior in arms and discipline. It is said that more than one incursion has been made into Russian territory; but there is little facility for obtaining accurate information as to the state of affairs in that remote region. Other rumours are current of conspiracies in the recently acquired Russian dependencies, which must undoubtedly contain many elements of disturbance; but, little as the Mussulmans of Khokand and Bokhara may like the rule of their conquerors, their kindred tribes of the same faith have a still deadlier feud with the Chinese. There is no bloodier episode in Oriental history than the total or partial extirpation of the population which had for some years belonged to a newly established kingdom under a Mussulman chief. It had been supposed that the Turkish tribes of the border had achieved permanent independence; but on the death of the founder of the dynasty they were unable to resist the slow and resolute advance of the Chinese forces. The imagination may well be impressed by the deliberate resolution of generals who halted on their march to sow and reap a harvest as a substitute for an ordinary commissariat. The terror which was inspired by the numbers and steady purpose of the conquering army probably tended to produce submission in a district which had not yet been overrun.

The moral or diplomatic merits of the quarrel between Russia and China will have but little influence on the result. The facts are still imperfectly known; but it seems that Russia several years ago occupied Kuldja with the assent of the Chinese Government, under an undertaking to restore the province to its former owners as soon as they were in a position to maintain their authority. At that time the ATALIK GHAZEE was still prosperous and apparently powerful; and it may probably have been supposed that the engagement to restore Kuldja was merely nominal. When the Mahometan power was finally overthrown the Chinese demanded the evacuation of the province; and, to a certain extent, the justice of their claim was admitted. The Russians stipulated for the retention of certain districts in repayment of their outlay during the occupation of Kuldja, and the division of the territory was arranged in the treaty which has since been disavowed at Pekin. On the face of the transaction the bargain seems to have been equitable, though it is possible that the Russian claim of territory may have been excessive. At Livadia, where the treaty was signed, the unfortunate Chinese Ambassador may possibly have been cajoled or overawed, but there is no reason to doubt the loyalty with which he interpreted and executed his instructions. According to European precedents, his Government was entitled to withhold ratification of the treaty, at the risk of the consequences which might follow an unfriendly proceeding. It was nearly certain that, on the rupture of the negotiations, the Russian Government would regard as no longer binding the provisional arrangement under which Kuldja had been held. If the Russian garrison, with due reinforcements, continued to hold the province, it seemed and still seems a hopeless enterprise to repel it by force.

The war, if it begins or proceeds, cannot be immediately dangerous to Russia, but it may be extremely inconvenient. The numbers of the Russian army are sufficient to meet graver emergencies; but the movement of troops from distant

provinces of the Empire is costly, and a chronic quarrel with China would involve a large and permanent drain on the finances. If Kuldja is kept or reconquered, it must be defended against an obstinate enemy, who will not be deterred by defeat from attempts to retrieve his losses. For some time past the Russians have had no external adversaries to fear in Central Asia, with the exception of the nomad Turcomans. The Khanates have been effectually subdued, and the paramount Power can take care that the native rulers have no opportunity of organizing an army. The Chinese in the interior of their own territory are out of reach; and they will probably have no difficulty in supplying the losses which they may suffer in the war. The reinforcements which may be required on the Eastern frontier cannot safely be provided from the ordinary army of occupation. The restlessness which will ensue on the outbreak of a new war must be kept in check by the presence of sufficient forces at all the principal posts. The Turcomans, if they find themselves relieved from the danger of an invasion during the present summer, will not fail to make themselves troublesome. Were it not for the continuance of the Afghan war the neighbours and rivals of the Russians in Asia might look forward to the proverbial pleasure of watching from a place of rest the troubles of strangers; but in the present case there are reasons of self-interest as well as of philanthropy for deprecating a contest which is apparently imminent.

The chief danger to Russia will be that in a prolonged struggle the Chinese may learn to fight; and other European nations, including England, may have reason to watch with anxiety the progress of their military education. China has almost all the elements of power; but it has not yet mastered the modern art of war. A proud and ignorant dislike to imitation of foreign practices has alone prevented the organization of a formidable army. In the war of twenty years ago a comparatively insignificant French and English force occupied the capital and enforced the signature of the Treaty of Tientsin; yet the Chinese were animated with deadly hatred of the foreign invaders, and the vast population furnishes the material of an effective soldiery in inexhaustible abundance. The Chinese are for the most part robust, temperate, obedient, and extraordinarily exempt from fear of death. Even now a Chinese army, properly equipped with arms of precision, and led by European officers, would perhaps be more than a match for equal numbers of any other Asiatic nation. The French and English war lasted for so short a time that the lessons which it taught were imperfectly learned; for soon afterwards the weakness of the Empire was illustrated by the wide success of the Taeping rebellion. When the Imperial troops under an English officer of genius finally restored the authority of the Emperor, the Government probably believed that it had at last created an efficient army. In the contingency of a rupture with Russia, the Chinese troops will discover their own helplessness; and probably they may be induced to profit by their experience. If, after successive defeats, they renew the struggle year by year, each campaign will be more and more evenly contested. Colonel Gordon's sudden resolution to proceed to China will excite reasonable comment; but confidence may be placed in the sincerity of his intention to dissuade the Chinese Government, if possible, from war. It is to be regretted that he has left his subsequent intentions in doubt.

No policy could be more shortsighted than encouragement on the part of England of Chinese hostility to Russia. It is well known that all the Foreign Embassies at Pekin have urged the Government both to release the unfortunate dignitary who negotiated the Treaty of Livadia, and to come to terms with the Russian Government. There are many reasons for regarding a war with anxiety. The aggrandizement of Russia would not be altogether welcome; and, on the other hand, any successful resistance would confirm and increase the ordinary arrogance of the Chinese. If war occurs, the Russian Government will not content itself with the occupation of the disputed territory, or with the annexation of neighbouring provinces. A squadron is already preparing to threaten the coast; and the institution of blockades will offer great impediments to trade. The commerce of England with China, though it is hampered by vexatious restrictions, still exceeds in value the collective trade of all other nations. Russian cruisers would at least not facilitate the commercial intercourse of a rival, and, as in all similar cases, collisions would inevitably ensue. At the same time the Chinese would become more and more hostile to foreigners, who, in contradistinction to themselves, are all regarded in a certain sense as a single community. Their opinion is not altogether without foundation, for Europeans and Americans have a common interest in resisting the encroachments of Chinese functionaries. The little commonwealth of Shanghai, though it is nominally subject to China, has for the most part been harmoniously administered by a kind of Board representing all civilized nations. With the Kuldja question, even if it were fully understood, the English Government could have nothing to do. Its business is to profit by every opportunity to prevent a rupture or to shorten the war.

EGYPT.

A NEW Parliamentary Blue-book on the affairs of Egypt has just been published, containing the diplomatic history of Egypt from the end of June to the end of December of last year. In one sense its contents are now out of date, for it treats of the state of things when the new Viceroy began to reign, and this state of things has passed away; of negotiations regarding the Rothschild Loan, which long ago were brought to a conclusion; and of the measures taken to institute the Commission of Liquidation, which is now on the point of concluding its very useful labours. But in another sense there is much to be found in the volume which is of present, because of permanent, interest. Things in Egypt are very much improved, a better system of government having concurred with an exceptionally good harvest in lightening the burdens of the peasants. But a country like Egypt cannot be radically changed all at once, and the Blue-book throws a very instructive light on the condition of the peasantry less than a year ago. Egypt is still under a joint Protectorate, and the machinery of this Protectorate is now working smoothly; but difficulties may arise any day, and anything is useful which shows, as many of the documents in this Blue-book tend to show, what are the relations of the protecting Powers to the other great Powers. Lastly, there is a cluster of minor Powers who are each allowed to have something to do with Egypt, although it is difficult to say how much; and, in considering the present and future history of Egypt, any instance of the leaning of one of those little Powers to the great Powers on an Egyptian question, and of the attitude assumed towards a recalcitrant little Power, deserves notice. On one occasion referred to in the Blue-book, it was thought necessary to get the consent of Greece, and Greece amused itself with giving as much trouble as it dared to give, until at last it was told that it must not give any more trouble. What has happened in this instance may happen again, and so a Blue-book which tells the story of this incident cannot be said to be treating of a matter that has no further significance now that it is once over.

After the late Viceroy had made the *coup d'état* by which he attempted to set the protecting Powers at defiance, and to arrange with his creditors after his own fashion, great efforts were made to get in money. An appeal was even made to those who had paid all they owed to pay something more to help their beloved ruler out of his difficulties. Few, if any, responded, and it does not appear that voluntary loans or contributions were extorted. Nor would it seem that there was anything more than the continuance of a bad system. And, as has always been the case in Egypt, and in every country like Egypt, there were differences in the treatment and sufferings of the peasantry in different districts. One local governor was more rigorous than another, the crops were good in one district and bad in another, legal remedies were enforced with more or less harshness. One Consular agent reports that in his district the rich were favoured; another reports that, so far as he has had an opportunity of knowing, rich and poor were treated alike. Where the peasant was in debt to moneylenders and was asked to repay what he owed, and at the same time was called on suddenly to pay up his taxes, he was in extreme distress, and often had to sell his land. But the agents of the English Government were not agreed as to the effect which the intervention of the International Tribunals had had, one thinking that it had been a source of unmixed evil, inasmuch as far too great facilities had thus been given to the moneylender, and another reporting that the expense and delay of having re-

course to these Tribunals was too great for the money-lenders to bear, and that they had preferred to wait. When the peasants were obliged to borrow money, they had often to borrow it on most extravagant terms, 13 per cent. per month being by no means an unusual rate. But when the crops were good the peasants did not need to borrow, or found no difficulty in getting money at 6 per cent. No doubt peasants who did not, or would not, pay these taxes were bastinadoed; but we find from one report that rich and poor were alike in danger of the bastinado, and one Consular agent even went so far as to assert that he considered that those who were bastinadoed in his district had no one but themselves to reproach, for due notice was given of the instalments of taxes that were to be paid, and the taxpayers ought to have got their money or produce ready in time. All the reports agree on some points. All state that recruiting continued to be enforced in an unfair way. "Wherever they see a strong-"looking man they take him," as one agent briefly put it. But this abstraction of the strong caused no dearth of labour. Nor was it found that there was any forced labour worth special notice. On one occasion labourers were made to load a boat with produce belonging to the Government, and were imprisoned for refusing. But the very fact that so much attention was drawn to this instance may be taken to show that there was nothing like a system of forced labour. There was, however, a general agreement that in the distribution of the water provided for irrigation the rich, or those in authority, had a very unfair advantage, the Government engineer in some places taking the water as far as his lands or the lands of his friends, and then stopping, although all the labour of making the watercourses was provided by the peasants. It is scarcely necessary to add that everywhere peculation went on, and funds that ought to have come to the Government were stopped on the way. As the new Government got more settled things got a little better everywhere, and towards the end of the year a very stringent circular was addressed to the district authorities, pointing out that they would personally be held responsible if proper protection was not given to the peasants. Altogether the state of things in rural Egypt cannot be said to have been particularly bad. What is shown is the facility with which abuses of all kinds might revive if European supervision were withdrawn.

The story of the ROTHSCHILD Loan has been so often told that it is not necessary to refer to it now, further than to say that the documents now published show how anxious Austria was to make it understood that on every ordinary question due deference would be paid to the wishes of the protecting Powers. It was only because in this special case the issue seemed to be raised whether the decisions of the International Tribunals should be allowed to have effect, that Austria, on behalf of herself, Germany, and Italy, refused her consent to the proposals of France and England. A very different question was raised when, not Austria directly, but a leading Austrian official in Egypt, made a suggestion, communicated as deserving consideration by the Austrian Government to Lord SALISBURY. The suggestion was, that as the system of Controllers-General had not worked previously without friction, it should be improved by adding members to represent others of the leading Powers. Lord SALISBURY took his time to deal with this suggestion, as he did not conceive that any official notice of it was desired. But when Austria pressed for an expression of his views, he took the opportunity of recording with decision and clearness the relations which, in his opinion, the two protecting Powers held in regard to Egypt and to the other Great Powers of Europe. Lord SALISBURY could not admit that the English and French Controllers had failed to exercise a salutary influence over the Egyptian Government. If friction had arisen, the way to increase, not to diminish, this friction was to bring in new Controllers, and open a door to new jealousies, rivalries, and misunderstandings. He had sufficient warning from the history of the Commissions acting under the Treaty of Berlin to be on his guard against so prolific a source of discord and disappointment as a Control in which many Powers were represented. In the interest of Egypt, therefore, he had to decline any proposal for increasing the numbers of the Controllers. But he frankly added that this was not all. England and France had, he said, a preponderance of influence in Egypt by virtue of the gravity and importance of the interests, political and other, which they possess in that country. The proposal to increase the number of Controllers was in effect to propose that England and France should surrender this preponderance. This would, at any rate, be the interpretation put on such a change in Egypt itself, and it was therefore impossible for England to accede to a proposal which would prejudice the position she held in conjunction with France. It must, however, be understood that none of the Powers concerned ever addressed themselves to the discussion of Egyptian affairs without recognizing that England and France alone have political interests in Egypt. All allow that it is only through their commercial interests that the other Powers are entitled to discuss Egyptian questions.

As the decree confirming the security by which the ROTHSCHILD Loan was protected imposed a new law on the International Tribunals, and as Greece was one of the parties to the treaties by which these Tribunals were established, the assent of Greece to the decree had to be procured. For some weeks Greece kept all the Great Powers waiting for this assent. After the date of the inscription of the ROTHSCHILD mortgage several creditors had registered judgments on the mortgaged lands; and among these creditors were some Greek subjects. The Greek Government thought that these Greek creditors would be prejudiced by its acceptance of the decree. It asserted that it could itself be sued for any damages thus caused; and, further, that the sanction of the Greek Chamber was necessary to any act by which the interests of any Greek subject could be considered to be imperilled. As these creditors would be liable to be treated as any other holders of the Floating Debt when the Commission of Liquidation proceeded to settle all outstanding questions of Egyptian finance, and as Greece would not be represented on the Commission, the Greek Government feared, or affected to fear, that Greek claimants would ultimately be treated worse than French claimants. It might have been regarded as somewhat offensive to France that such a supposition should have been gravely put forward. But so anxious were the Great Powers to finish a troublesome matter that not only France, but the other Powers, gave a solemn assurance to Greece that the anticipated injustice should not be done. Even this was not enough. The Greek Government still hesitated. Solemn protests against the conduct of the Greek Government were made, and the Austrian Minister was instructed to represent how unwise it would be for Greece at that moment to run counter to the wishes of England and France, and to dwell on the political considerations that ought to make the KING's Government pause before it assumed an obstructive policy in a matter on which the two Western Powers were intent. Ultimately this very significant warning had its effect, and the Greek Government yielded. But it took care to record that it yielded for political reasons only. It adroitly managed to establish some sort of claim on the good offices of the Western Powers against the day when its own affairs were to be debated in the councils of Europe. That Greece should have been able to give so much trouble, and that such powerful machinery should have been called into play in order to overcome the difficulty, cannot fail to raise some apprehensions as to the embarrassments which the protecting Powers may have hereafter to encounter in their conduct of the affairs of Egypt.

LOCAL OPTION.

THE effects of the late election and of the agitation which determined its result find a striking illustration in the majority which approved of Local Option. In the earlier Sessions of the last Parliament the House of Commons was still profoundly impressed by the influence which the publicans had exercised in the election of 1874. The Permissive Bill was again and again contumeliously rejected; and it was not until last year, when the Opposition was bent on seeking allies in every quarter, that Mr. FORSTER and some other leading members of the Liberal party professed their acquiescence in Sir WILFRID LAWSON's opinions. He had furnished them with a superficial excuse for conversion by changing the title of his scheme from a Permissive Bill, which meant the control of the sale of liquors by majorities in every parish or district, to Local Option, which means exactly the same. When Mr. GLADSTONE was bidding high in Midlothian for the support of every petty sect and faction, he professed to under-

stand by local option that the ratepayers should, by their representatives or otherwise, have a voice in the issue of licences. Such a system would be vicious in principle and pernicious in practice, but it has nothing to do with Sir WILFRID LAWSON's scheme of local option. The justices, who are far more competent to discharge the duties belonging to a licensing authority than an elected body, are charged with the duty of considering applications for licences on the understanding that every neighbourhood shall be provided with convenient accommodation. Sir WILFRID LAWSON candidly admits that he proposes to give the ratepayers a power of absolutely refusing licences. In this way the temperate and respectable portion of the community is to be unnecessarily exposed to interference with its habits and comforts for the supposed benefit of drunkards and for the gratification of fanatics. The House of Commons, in passing the Resolution, has openly proclaimed its own narrowness and incompetence, if indeed it is not rather liable to the charge of insincerity.

Modern democracy tends more and more in this country, as in Germany, to cultivate equality, which consists in the sovereignty of the greatest number, rather than the liberty which has hitherto been the main political characteristic of England. The doctrines of political economy, while the science was in fashion, coincided with the old national tradition, inasmuch as they involved the assumption that every man was the best judge of his own interests and business. The philanthropic and dictatorial spirit which has since prevailed is as officious and meddling as the bigotry of a religious sect in the seventeenth century. The sourest Scotch elder who ever denounced whistling on Sunday had as good a right as Sir WILFRID LAWSON or the House of Commons to dictate to his neighbours. It is perhaps not surprising that the same Assembly should approve of the Hares and Rabbits Bill and of Sir WILFRID LAWSON's Local Option. In one case the two parties who are exclusively interested in a certain subject-matter are prohibited from making a binding contract; and the personal conduct and habits of every man are by local option placed under the control of others. The extreme advocates of abstinence are more consistent, and, so far, more excusable, than the numerous supporters whom they have contrived to enlist on their side. A belief, however baseless, in the bad moral and physical effects of fermented and distilled liquors is on a level with the convictions which have always suggested religious persecutions. Sir WILFRID LAWSON's partisans wish to do good to others without consulting their wishes, as the Spanish Inquisition burnt heretics partly for their own spiritual benefit, and principally for the protection of the general orthodoxy. The greater number of those who voted a week ago for local option had not even the questionable merit of sincerity. Few of them have considered the inevitable results of the Permissive Bill, if it were passed into law. In some districts the population would be deprived for a time of its ordinary comforts, with the probable result of an early and violent reaction. In other places the trade in beer and spirits would flourish as at present, except that licensed victuallers would seek to protect their insecure position by taking every opportunity of increasing their precarious profits. In districts of either class there would be perpetual agitation, and the mischief would generally be aggravated by the alliance of the supporters and opponents of freedom with one or the other political party.

Mr. GLADSTONE avoided the expression of a decided opinion by professing his unwillingness to vote for an abstract resolution. No blame attaches to a Minister who alleges a formal reason for conduct which he may not deem it expedient to defend on the grounds which really determine his action. It is unfortunate that Mr. GLADSTONE was not equally cautious when he wooed the popular breeze in Midlothian. The declaration which he then made in favour of local option commits him to an erroneous theory. It would seem that, notwithstanding his penal legislation in the Budget, he is now desirous to conciliate the publicans by assuring them that they are to receive compensation for any sacrifice which may be imposed upon them for the public good. It would certainly be unjust to destroy the property of licensed victuallers, but their interests are not exclusively or chiefly affected by local option. Their customers, who are threatened with compulsory asceticism, and who cannot be compensated, are at least as much entitled to consideration. Unless Mr. GLADSTONE is prepared to allow the prohibition of the sale of beer, wine, and spirits, he ought not to be neutral on the subject of local option. If the temperance agitators are successful, they will undoubtedly proceed to encroach still further on personal liberty. Clubs, though they offer no temptation to working-men, will be compelled to submit to the restrictions which may have been imposed on public-houses. All the world will be deprived of a pleasure and convenience at the dictation of those who fancy that they require protection against their own tendency to excess. It is strange that members of a Government which proposes to raise a revenue of eight millions on beer alone should encourage a scheme which is intended to prevent the consumption of the article altogether. The deference which some candidates showed to the publicans at the election has been justly censured; but affected subservience to the fanatical party is at least equally blamable. The vote of last week will cause great embarrassment to the Government, which has indeed pledged itself to future legislation, apparently in the same direction. If it is merely intended that the justices shall be superseded by some elected body, licences will in some places be arbitrarily refused, and elsewhere they will become a subject of the most unscrupulous jobs. Perhaps the simple machinery of the Permissive Bill will be substituted for a transfer of the licensing authority. If the publicans whose business may be suppressed are to receive compensation, it may be presumed that the process will not be repeated. Those who afterwards engage in the business, if the prohibition is rescinded, will not be entitled to compensation, and probably they will be less respectable than the present body of licensed victuallers.

At a Liberal meeting at Scarborough, Sir HARCOURT JOHNSTONE, who shares the opinions of Sir WILFRID LAWSON, naturally referred to the vote in favour of local option as a proof of the great superiority of the present House of Commons to the last. To those who are not devoted to special theories and fancies, the triumph of the temperance agitators indicates a general unsoundness of principle. Wise legislators are not hasty to accomplish even an undisputed improvement if it is inconsistent with fundamental rules of policy. A diminished waste of turnips, or even of grain, is dearly purchased at the expense of a violation of the right of freedom of contract. The rhetorical phrase in which the Bishop of PETERBOROUGH once preferred liberty to sobriety expressed a sound doctrine. As one of the speakers in the late debate observed, the little sect of vegetarians might as reasonably demand that the consumption of butcher's meat should be allowed or prohibited by a popular vote. It is certain that, if they could emulate Sir WILFRID LAWSON in the number of their adherents, they would not be less eager to restrain the freedom of their neighbours. No virtue is rarer than tolerance or full respect for the rights of others. General dictation and interference are only restrained by conscious inability to enforce uniform opinion and conduct. Until lately English legislation abstained habitually from intrusion into the sphere of private discretion. Some exceptions from the general rule of abstention which were found to be necessary are now used, as in Sir W. HARCOURT's irritating speech on the Hares and Rabbits Bill, as precedents for further intervention. The vote for local option will form a remarkable addition to the list; but, while the present majority retains power, instances of the kind will become more common than exceptions. Landowners and many other classes are beginning to find that Parliament is prepared to regulate their affairs at its pleasure.

THE AMNESTY AND M. GAMBETTA.

THE resolution of the French Government to propose a plenary amnesty is remarkable for the circumstances under which it was taken, and for the manner in which it has been carried out. It was perfectly understood that an amnesty would be granted by and by. In the February of this year M. DE FREYCINET had for the first time spoken of such a measure as dependent upon the course of events, and he had further explained that by the course of events he meant the conduct of the Extreme Left. We pointed out at the time that a delay which was to come to an end so soon as the Extreme Left had shown themselves to be good children was not likely to be a long one. M. DE FREYCINET would not wish to have to admit that any section of the Republican party had proved hopelessly intractable, and he would consequently be careful not to make the trial of their patience too severe. A mother who distrusts at once her child's temper and her own firmness will be anxious to

make the period of probation as short as possible. Nor, when once the intention to grant an amnesty eventually had been acknowledged, was there any obvious motive for postponing it. The position of preceding Ministries on the question had been quite different from that taken up by M. DE FREYCINET. They had maintained that the acts of the Communist leaders had been different in kind from those of ordinary insurgents. Political crimes are severely punished when severe punishment is demanded by political needs. When the need is over, there is, according to modern ideas, no object in going on with the punishment. But the burning of Paris and the slaughter of the hostages were not in the first instance regarded as political crimes. They were treated as arson and murder, and as arson and murder of a peculiarly bad type. So long as this view of the Commune was generally accepted it was plainly impossible to concede an amnesty, and when the Government ceased to speak of an amnesty as impossible, it was naturally and logically assumed that they had ceased to give the Commune an exceptional rank among insurrections.

Still there was nothing in M. DE FREYCINET's speech last February to show that he contemplated making the concession before Midsummer, or that, when proposed, it would be hurried through the Chamber with such extraordinary speed. These elements in the transaction may fairly be attributed to the influence of a greater than M. DE FREYCINET. What is it that has made it necessary that the subordination of the PRIME MINISTER to the PRESIDENT of the CHAMBER of DEPUTIES should be revealed so suddenly and completely? It has long been believed that M. GAMBETTA has in M. DE FREYCINET a friend who does not despise the function of warming-pan, or who at all events is willing to discharge it, even if he does despise it. Consequently, if M. GAMBETTA had made up his mind that it was time to grant a plenary amnesty, all seemingly that he had to do was to convey his opinion to M. DE FREYCINET, and leave the PRIME MINISTER to determine the best method of carrying out his chief's instructions. As it was, the supremacy of M. GAMBETTA over the Cabinet has been shown with a plainness which would be offensive if it had been employed without good cause. All France is called upon to observe that the amnesty would not now have been conceded had it not been for M. GAMBETTA. The question is raised, it is discussed in a Cabinet Council, it is decided adversely to the proposal. It cannot be supposed that Ministers would have gone to work in this rash way unless they had ascertained either that M. GAMBETTA did not wish the amnesty to be proclaimed immediately, or that he wished it to be more directly associated with himself than it would be if it were brought forward as the unprompted decision of the Cabinet. The determination not to propose an amnesty must apparently have been taken for the express purpose of being overruled in a quarter where will and power are more nearly one than they are in M. DE FREYCINET's Ministry. At all events, as soon as the determination had been taken, the machinery which was to reverse it was at once set in motion. M. GAMBETTA was not content with bringing his influence to bear on the Government; that, as has been said, he might have done in private with quite sufficient effect if the amnesty itself had been his only object. But he wanted, to all appearance, that his share in the business should be notorious to all the world. It was not enough that he should remain a sleeping, though influential, partner; he wished on this occasion to be seen and known as the acting partner.

If it were possible for him to assume this character merely for a moment and then lay it completely aside, the affair would have much less interest and much less importance than it now has. It is easy to imagine reasons why M. GAMBETTA should wish to have his name associated with a plenary amnesty, and why he should think that there is no time to be lost in so associating it. M. GAMBETTA's ascendency over the Left is no longer unchallenged. A newer stratum has come to the surface which prefers M. CLÉMENCEAU, and if M. GAMBETTA is to retain his title to leadership, he must do something to justify it. The amnesty question had some obvious recommendations for this purpose. It is for the moment the popular cry in Paris, and the politician who identifies himself with it may look for at least a passing popularity in a constituency which M. GAMBETTA must find it daily harder to keep in hand. At the same time, no one has lately supposed that it could be staved off for ever, so that when once the discussion of it is over, even moderate Republicans may feel grateful to M. GAMBETTA for getting the question out of the way. But the manner in which it has been got out of the way is likely to land M. GAMBETTA in new difficulties not less serious than those which he has surmounted. If he had no enemies, it might matter little that he has just shown that the Ministers are nothing more than his puppets, and that whenever he wants to act without them, he has only to call a meeting of the Left, or to make a speech in the Chamber, to see his wishes as carefully carried out as though he were an absolute sovereign. As it is, the spectacle is one which is excellently suited to stimulate the ambition of those deputies who think themselves equal to M. GAMBETTA in everything but the actual possession of power. It is useless for them to deny his supremacy, since the fact that the Cabinet and the Chamber have rivalled one another in the rapidity with which they have accepted the amnesty the moment that they were sure that he wished them to accept it is conclusive evidence that he is supreme. Yet the position he occupies is so unusual that they may fairly hope to make it impossible for him long to hold it. To say that the man who possesses the substance of power should possess the form is not to proclaim yourself the enemy of M. GAMBETTA; it is only to espouse the better opinion in a grave constitutional controversy. The French Constitution knows of a President of the Republic, and of Ministers appointed by him, who are responsible to the Chambers for their policy. It knows nothing of a man who is neither President nor Minister, and yet enjoys a degree of authority greater than that of President and Minister put together. With two offices virtually awaiting his acceptance—for, if M. GAMBETTA chose to be either President or Minister, there is no question as to his ability to get rid of the present occupant of either post—there is much reason in the contention that he ought either to make up his mind which to take, or to cease to discharge informally the functions of both. If he were President of the Republic, he could have Ministers forced upon him. If he were Prime Minister, he could be turned out of office by a hostile vote. In his present position he is free from both dangers, and, by consequence, it is perfectly natural that those who secretly wish to see him discredited and dismissed should be eager to force on him the greatness which they hope would prove so fatal a possession. The course which M. GAMBETTA has taken on the amnesty question will very much strengthen the hands of those who know that he must rise higher yet before they can hope to drag him down. A President of the Chamber who is at once the master and the servant of those whose deliberations he guides—a dictator who wears no recognized ensign of power and can shelter himself behind the neutral character of his functions whenever it pleases him —is a personage whom it is not difficult to attack with a fair prospect of success. France has long looked forward to the eventual assumption by M. GAMBETTA of the chief place in the State, and it may not be difficult to convince her that the time when this desire should be gratified has at length arrived. There can be no question that M. GAMBETTA realizes this as clearly as any of his adversaries, and it can hardly be long before we shall be able to judge whether he thinks himself strong enough to resist the pressure or is convinced that the time has come for yielding to it.

PERMISSIVE VACCINATION.

THERE is every reason—it would be more logical, perhaps, to say that there has until now been every reason—to suppose that HER MAJESTY's Government are anxious that the spread of small-pox and of contempt of the law should alike be discouraged. If this theory of their wishes is to be retained, as we are sincerely desirous it should be, it becomes exceedingly difficult to account for a Bill which has recently been introduced to modify the laws relating to vaccination. That these laws need modification is possible. They are not infrequently disobeyed from carelessness; they are occasionally openly defied. As neither of these modes of treating a statute deserves any encouragement, any proposal on the part of the Government to make the observance of the law more general would have a good claim to the consideration of Parliament. HER MAJESTY's Ministers have apparently got as far as the recognition that some change

is wanted in the Vaccination Acts; but, having reached this point, they have unfortunately persuaded themselves that any change in them will be an improvement. At least, if they have not persuaded themselves of this, it is impossible to explain the contents of their Bill. The object which the legislator ought to keep in view is the enforcement of vaccination upon the wrong-headed minority which is determined, so far as in it lies, to make every Englishman's house his own small-pox hospital. It is not to be denied that there are difficulties in the way of doing this. During the prevalence of a small-pox epidemic it might be easy, if only the epidemic were universal enough, to obtain fresh legislation of the most stringent kind. To a great extent, however, vaccination is its own worst enemy. It has made small-pox so rare by comparison with what it once was that people are no longer keenly persuaded of its absolute necessity. If the Anti-Vaccinators could have their way, and every third person met in the street was once more marked by small-pox, to pass a highly satisfactory Vaccination Act would be the simplest thing in the world. The only danger would then be that Parliament, in an excess of fear, might make the penalties for omitting to have a child vaccinated too severe for magistrates to care to inflict them. As it is, nobody seems much to care whether small-pox is increasing or diminishing. But, if it is useless to appeal to people's fears, it may not—at least it ought not to—be useless to appeal to their sense that the law should not be brought into ridicule. That the operation of the new Vaccination Bill must tend directly to bring the law into ridicule seems to be clear. The conversion of a positive command into a command which may be evaded by the simple process of taking out a licence for disobedience puts the legislator into this dilemma: Either he thinks the command important, and then he has no business to treat it as a matter to be compromised by a money payment; or he thinks it unimportant, and then he has no right to punish people for disobeying it. At present the law orders every parent to have his child vaccinated, and in the event of his omitting to do it punishes him by a fine. If Mr. Dodson's Bill passes, the law will still order every parent to have his child vaccinated; but at the same time it will intimate to him in a sort of aside —unless you would prefer paying a pound to be let off. Indeed, in districts where the feeling against vaccination happens to have infected the magistracy, a man may be let off for much less than a pound. There is an alternative provision in the Bill that no proceedings shall be taken against any person for breaking the law if the offender has already been fined twice. Two penalties, therefore, however small — say a shilling each—will enable a man to snap his fingers at every sanitary authority, and to secure for his children the sacred privilege of catching small-pox whenever there is small-pox to be caught.

The only possible explanation of this measure is one which traces it to an exaggerated dread of being illogical. Its defenders will probably maintain that, to be consistent, the law ought to go a great deal further than it does. If the end to be attained is the vaccination of every child, to set about attaining it by punishing those who refuse to have their children vaccinated is to prefer a highly roundabout process to a direct one. Why not leave the parent alone, and order the policeman to take the child to the vaccinator? The answer of course is that to do this would be to render the working of the law so unpopular that it might in the end defeat its purpose. A process is efficacious in proportion as it effects the object for which it is resorted to, not in proportion as it seems calculated to effect it. It would be of very little use to give the police authority to look at every baby's arm, and, if the vaccination marks were not forthcoming, to take the child off to the doctor, if the police perfectly understood that they would get no praise for using their authority, and no blame for omitting to use it. The law might be perfectly consistent, but if at the same time it were perfectly unworkable, the consistency would not make obedience to it at all more general. Well, then, the Government must be supposed to say, since you admit that you are not prepared to vaccinate children by force, what is the good of going on multiplying fines? You get no nearer the vaccination of the child, while you make the law more and more disliked. Neither of these imaginary objections seems borne out by facts. It is true, no doubt, that, in the case of a few obstinate fanatics, the law is no more likely to be obeyed by them when they have been fined twenty times than when they have been fined once. But these are exceptional instances of obstinacy. Probably a large proportion of those who have an objection to vaccination do not feel that objection so strongly as to make them submit to any serious inconvenience rather than forego it. Now to be fined once is not a serious inconvenience. It is hardly more than going to the Post Office to pay the dog tax or the carriage duty. When, however, this fine has to be paid in uncertain amounts, and with uncertain frequency, the constancy of the anti-vaccination fanatic is much more severely tried. No one very much minds being once summoned by a cabman; but, if the chance of a summons had to be incurred every time that a cab was hired, a great deal more walking exercise would be taken. The last thing that the law should do is to encourage those whose obedience it demands to gauge accurately its power of enforcing obedience. A little obscurity is here a decided advantage. The man who knows that, in refusing to have his child vaccinated, he is entering upon a conflict of which the duration and severity are alike uncertain will be very much less likely to venture upon such a refusal than the man who knows that the worst that can happen to him is to have to pay a pound for the pleasure of indulging his whim. In the former case the law does not announce beforehand that it does not mind being disobeyed, and if, as a matter of fact, some very obstinate anti-vaccinator succeeds in wearying the authorities into taking no further proceedings against him, it is the authorities, not the law, that is in fault. Mr. Dodson proposes to make the law proclaim its carelessness about being obeyed in the very same breath in which it issues the command. It would give every recalcitrant parent his choice whether to take his child to the vaccinator or to pay for permission to keep it at home. When that permission could be got for a single payment of a sovereign, it would become a point of honour with every objector to show that he held his opinion to be worth more than 20s. What amount of respect could a law hope to obtain, or feel to deserve, which carried its own impotence thus writ large on its forehead? Just as much, and no more, as the legislators who have made themselves responsible for so wanton a proposal.

WHAT IS ELEMENTARY EDUCATION?

We are not fond of Select Committees. They are often ingenious devices for telling people what they knew before, or for helping them to postpone doing what they very well know that they ought to do. It is to be wished, however, that the victory which Lord Norton won in the House of Lords on Friday had been directed to inquiry into the proper frontier line between elementary and secondary education rather than to the immediate excision of the Fourth Schedule from the Code. We do not mean of course that the Code itself, or any part of it, should be referred to a Select Committee. It is the business of the Education Department to carry out the intentions of Parliament as regards the grants made to schools, and there is not the slightest reason to believe that in this respect the Department has not done its duty. What is now wanted is a clear manifestation of the intentions of Parliament upon a point which has never yet been properly raised. The debate in the Lords has shown that a great deal of misapprehension exists as to the object of Lord Norton's effort. His motion has been represented as a mere expression of a reactionary desire to make elementary education as nearly worthless as is decently possible; and when it is objected that the Bishop of Exeter is hardly the man to take a foremost part in an agitation of this kind, it is answered that the Bishop of Exeter has been led away by his peculiar views about what ought to be included in elementary education. Consequently the result of Friday's division will probably be that the question will be re-argued with a different result in the Commons, and that on the strength of this the Government will meet the address from the Lords with a polite refusal.

If, however, the two questions just mentioned were thrashed out by a really strong Committee, it would be impossible to deal with it in this way. The chatterers about live knowledge would fare but ill under cross-examination by the Bishop of Exeter, and

Mr. MATTHEW ARNOLD's evidence would make it hard to assert any longer that opposition to the Fourth Schedule is opposition to elementary education. It is plain that the end aimed at by Lord NORTON will not be achieved without a good deal more exertion than is involved in a two hours' debate before dinner, and unless some real step towards it is made in a very short time, it will probably not be achieved at all. If Parliament, said the Bishop of EXETER, does not interfere now, interference will soon become impossible. The vested interests of various kinds which have grown up round the present system of elementary education are so many and so powerful that it is yearly becoming more difficult to attack them. The last School Board elections made it pretty evident that no effectual aid is to be expected from the ratepayers. Naturally enough, a ratepayer whose child is receiving a largely gratuitous education is more interested in maintaining this kind of expenditure than half a dozen ratepayers who have no children in this position are in reducing it. Those who are actually engaged in elementary education, whether as managers or teachers, are naturally disposed to magnify their office, and to make the instruction given in their schools more interesting to themselves, if not to the children. Nor, even if it were possible to effect a reconstruction of the Education Code by the aid of educational economists, would it be altogether desirable to do so. Undoubtedly the question of expense has a fair claim to consideration; but the attack upon the present Code ought not to be conducted entirely, or even mainly, upon that ground. If it is so conducted, confusion is sure to arise between the expenses attendant upon a really elementary education and the expenses attendant upon an education which professes to be elementary and is not. A crusade in favour of economy pure and simple would be as likely to cut down the former outlay as the latter. It is important to keep before the public that the fatal objection to the present Code is, not that it spends too much money on elementary education, but that it spends too much money on secondary education given at the wrong time in the wrong place and to the wrong children, and that in consequence of this expenditure elementary education really suffers. If Parliament is of opinion that the extension of State aid to secondary education is desirable, we have no wish to oppose it. The taxpayers have a right to spend their money in the ways which please them best, and undoubtedly there are many ways in which their money is now spent which confer less benefit on the community than would be conferred by a good system of secondary education. What we object to is the introduction of an imperfect and practically useless smattering of secondary education into elementary schools. It is no answer to Mr. ARNOLD's question, Why do School Boards press specific subjects into elementary schools? to say that, if they are not taught in elementary schools, they will be taught nowhere. They might as well be taught nowhere as taught in elementary schools, because they cannot be taught properly there. To teach them improperly is at best simply useless, while, in so far as it prevents their being taught where they might be taught properly, it is actively mischievous.

It is convenient, of course, for the opponents of Lord NORTON's motion to assume that the excision of the Fourth Schedule would condemn the children in elementary schools to a dreary routine of reading, writing, and arithmetic. Those who make this complaint show that they have not read the Code which they essay to defend. If the Fourth Schedule were struck out, and not a word said about "translation of conversa-"tional sentences" into French or German, with "tolerable correctness of pronunciation," or even about the parallelograms of velocities and forces, the 19th article, C. 1, would remain. We will quote this paragraph in full, for the benefit of those who have not time to master the facts of what they talk or write about. Managers, it says, may claim "the sum of 2s. (*or* 4s.) per "scholar, according to the average number of children, "above 7 years of age, in attendance throughout the year "(Article 26), if *the classes* from which the children are "examined above Standard I. pass a creditable examina-"tion in any one (*or two*) of such definite subjects of in-"struction as are shown by the time-table to have been "taught throughout the year *through reading lessons*, illus-"trated, if necessary, by maps, diagrams, specimens, &c., "and according to a graduated scheme which the Inspector "reports to be well adapted to the capacity of the children." Thus, if Lord NORTON had done his worst, and the Fourth Schedule had disappeared into the limbo of abortive educational projects, money would still be paid for proficiency in "geography, natural history, physical geography, natural "philosophy, history, social economy, &c.," provided that whole classes, and not merely individual children, passed a creditable examination, and that these subjects had been taught throughout the year through reading lessons. Thus the Code, with the Fourth Schedule left out, would contain a reasonable scheme for teaching the children such elements of knowledge as can be conveyed through their reading lessons, and thus preventing their reading from becoming a mere routine. All that the Fourth Schedule does over and above the clause which has just been quoted is to provide for the further teaching of individual children in subjects "which have *not* been taken during the year "as class subjects." In other words, it goes beyond the point at which the elementary knowledge of definite subjects can be conveyed as a part of elementary instruction—that is, through the processes by which, and to the children to whom, elementary instruction is ordinarily imparted, and singles out particular children for subjection to particular teaching distinct from that given to the school generally. If this is elementary education the phrase has ceased to be used in its obvious meaning. It will be unfortunate if our educational legislation should need to be accompanied by a lexicon of words employed in an unusual sense.

DEGENERATION.

PERHAPS the last trace of the belief in a Golden Age is to be found in the theory that all savages have fallen from a higher civilization—in other words, have degenerated. It is not easy to understand the comfort which this doctrine has given to many excellent people. Why should we rejoice in man's great alacrity in sinking? The other, and now more successful hypothesis, that most savages are people who have painfully climbed the earliest steps in the ladder of progress, seems really more genial and more optimistic. If we let the natives of the Admiralty Islands alone for a few thousand years, perhaps they may evolve the idea of "making them breeches to wear," like Bryan O'Lynn. And this seems a more cheerful hypothesis than that of persons who hold that the ancestors of the Admiralty Islanders were once quite well dressed, and that they gradually threw away all raiment but the decorative shells in which they now go bravely. But it clearly will not do to deny the existence of degeneration as a fact in human history. The British pauper, the British criminal, is often a creature much more truly mindless, much feebler of will, much less ingenious than the naked savage. Yet the pauper or the criminal may be the descendant of the Plantagenets. In the same way the modern Egyptians are inferior perhaps to the fellahs of the Ptolemys, and the modern Greek does not come up to "the ancient Spartan ticket." No one can deny that the imperial race of Rome degenerated, and if the ferocious Mayas of Central America are the descendants of the builders of Uxmal and Palenque, they too have fallen off sadly from their early glories.

The whole subject of degeneration has lately been dealt with by Mr. Ray Lankester in a little volume which we hope shortly to notice more particularly. It may be worth while to apply his theories to apparent cases of degeneration in man. Mr. Lankester, as a true Darwinian, begins at the beginning, with rudimentary sea-beasts and such small deer. There are, he says, certain animals which show a local or limited degeneration. The common lizard (*Lacerta*) has five toes, the Bipes has only a pair of stumps. The Bipes reminds us of the pobble in Mr. Lear's poem:—

> The Pobble, who has no toes,
> Had once as many as we;
> When they said to him he might lose them all,
> He replied, "Fish, fiddle-de-dee."

Suppose this local degeneration to extend to all the important organs, so that not only the toes, but the mouth and digestive organs, were obliterated, and we have an instance of pretty thorough degeneration. In degeneration, then, "the organism becomes adapted to less varied and less complex conditions of life." The Ascidian's life, for example, is far from being either varied or complex. No animal is less inclined, or indeed less able to "burn," as Mr. Pater says, "with a hard gem-like flame." No creature is more "sessile or immobile," none fails more absolutely to "maintain an ecstasy" or to cultivate high passions. The Ascidian is a tough mass, like a leather bottle with two openings, and sea-water continually goes in at one opening and out at the other. That is all the life of the Ascidian. Now Mr. Lankester holds that the Ascidian is an awful example of degeneration. The creature has known better times. This is proved by the fact that young Ascidians, in the tadpole stage, are comparatively lively and complex. At a certain period the festive tadpole fixes his head to a rock, his eye disappears, and his outer skin grows hard and leather-like. As is the race of Ascidians, so is that of man. In

youth we are lively and complex. We have hearts, sentiments, desires; we try many things. Then, like the Ascidian tadpole, we fix our heads to a rock—that is, take to a profession, or go into Parliament, or otherwise form fixed habits. We lose our eyes, like the Ascidian tadpole, our eyes for the beauty of the world; we live in towns; our hearts cease to exist; the young poet within us expires; we cease to be sensitive; our "outer skin grows hard and leather-like." Thus a scientific observer of a higher species than ours would justly conclude that a middle-aged City man or barrister is really a degenerate, not an elaborated, being. Our youth proves that we were meant for higher things, and that money-making is not really the end and aim of human existence.

Animals degenerate when their ancestors have taken to immobile or to parasitic habits of life. Among men the agricultural labourer represents the animal whose ancestors have taken to immobile habits of life. They have scratched the same acres since the English Conquest. Thus the agricultural labourer is so degenerate from the common English standard that the County Franchise Bill is still a matter of debate. For examples of human parasites we may choose paupers and critics. That paupers breed still lower paupers is an acknowledged fact. That a purely critical or parasitical literature degenerates into drivel and superstition is a truth scarcely less generally admitted. But there are other ways of degenerating. Life may be made too easy and simple, and thus men decay. Let us imagine, with Mr. Lankester, a race of animals fitted and accustomed to catch their food, and possessed of a variety of organs to help them in the task. Then let these animals acquire a taste for carbonic acid, dissolved in the water around them. The animals will give themselves up to the facile enjoyment of carbonic acid. "They would cease to hunt their food, and would bask in the sunlight, taking food in by the surface, as plants do by their leaves." Certain small worms seem to live in this manner, which, to overworked men, seems not without its merits. The stomachs of these happy reptiles have almost disappeared, because they are no longer wanted. It is not difficult to find human parallels to the worm. Races who live in a kind of "ready-made land," near the Tropics, are commonly degenerate. The indignant Englishman bids the emancipated negro toil, but the black man does not see the necessity. He lolls in the sun and sucks sugar-cane. His active powers diminish, but he is not unhappy. In Brazil, says the traveller, the nigger's life is too easy. He goes out and plucks a melon; he scoops out the inside and eats it; he puts one-half of the shell on his head, and sits down on the other half, and is satisfied. Men who find life so easy take it easily. They neither toil nor spin, nor read nor write; and if tobacco is a produce of the soil, they degenerate into mere smoking vegetables. A European example is the degeneration of the Irish, as a consequence of the introduction of the potato. But this topic has furnished an undying illustration for the use of political economists. Perhaps the degeneration of the Roman people may be traced to the ease with which bread was obtained from the granaries of Egypt and the public charity under the Empire. When the demagogue in Aristophanes offered the spoils of the Athenian Empire to all the citizens, he was preparing a similar degeneration.

Mr. Lankester thinks that degeneration may partly explain the condition of "the most barbarous races, such as the Fuegians, the Bushmen, and even the Australians. They exhibit evidence of being descended from ancestors more cultivated than themselves." This is a statement which is frequently made, though we do not precisely know where the evidence to which he refers can be found. But, granting that he is right, we scarcely see how the processes of degeneration already explained came into action, for example, among the Fuegians. It is rather the hardness than the opulent ease of their existence that strikes the observer. Probably no race ever willingly settled in such a land of starvation, of fire and frost, as that which they inherit. To get shellfish enough for each day's meal seems a sufficiently difficult task. It may be the changelessness of their mode of lingering on the earth's surface that has stinted their growth in body and mind. But surely poverty and hardness of life alone will make men degenerate as readily as will indolent ease. The life of the Australian black fellow can only make him degenerate by causing him to cultivate the animal to the prejudice of the human faculties. The continent of Australia lacks the plants and animals necessary to civilization. There are neither cereals nor beasts of burden. If the Australians are really degenerate, it must be because they came from some other land where their ancestors had advantages in the way of food and of domesticated animals. You cannot train the kangaroo to draw carts; and the opossum, the wombat, the bandicoot ("that wildly sympathetic brute," as the poet calls it), the native cat, and the native bat are equally useless for the purposes of domestication. The clover-fern, too, is a poor substitute for wheat, and the yam is about as nutritious as the radish. Gums, raspberries, and wild cherries do not supply what Homer calls the "marrow of men," and thus the bareness and meagreness of their resources constrained the Australians to a wandering hunting life. Considering the nature of that life, perhaps they are rather to be reckoned as advanced and progressive than degenerate. Indeed Mr. Alfred Wallace, in a recent article in *Nature*, seems to look on the hard careful life as a cause, not of degeneration, but of improvement. He draws the moral that "labour and effort, struggle, and difficulty, discomfort and pain," are the necessary conditions of all progress, whether physical or mental. "The lower the organism, the more need there is of these ever-present stimuli, not only to effect progress, but to avoid retrogression."

Plato solved the problem of degeneration in a manner very unlike that which science suggests. Starting from perfection, he imagined that in all human affairs a fatal element of imperfection must manifest itself. "Fertility and sterility of soul and body occur when certain circles are completed. But to the knowledge of these things in men all the wisdom and education of your rulers will not attain; the laws which regulate them will not be discovered by an intelligence which is alloyed with sense." There is a necessity, a fatality, in the process of degeneration, which mortal wisdom can neither detect nor retard. And, so far, Plato's wisdom is wisdom still. It is only in the past, and when we deal with evils beyond remedy, with races sunk hopelessly from their ancient vigour, that we can explain the slow process of degeneration.

Our own times are too near us to be studied in a correct perspective. The forces at work are too many, too subtle, and too powerful to be diverted from their scope. We advance or decline insensibly, and neither the Darwinian nor the statesman can avert or hasten the inevitable end. Probably we must be content with the optimism of Mr. Wallace, who sees in evil "the essential condition of progress . . . which will only cease when the mind has become so thoroughly healthy, so well balanced, and so highly organized that the happiness derived from mental activity, moral harmony, and the social affections will itself be a sufficient stimulus to higher progress and to the attainment of a more perfect life." But it is certain that degeneration will take its turn in weaving the web of history till we are all what Mr. Wallace hopes we may be, after which will follow the coming of the Coquecigrues. Till that happy hour too much ease and too much hardness of life, failure and prosperity, will work towards national degeneration. But for individuals it is a safe rule to avoid the example of the Ascidian, and not to fix the head to the rock of habit.

POLITICAL HIGH-COCKALORUM.

KING CHARLES II., on the authority of Sir Walter Scott, is reported to have said that half the things he saw in this world reminded him of the tales of Mother Goose; and it is certain that to the philosopher the sports and legends of his youth constantly supply parallels to the experience of his riper age. The sufferings of Her Majesty's Government have recently reminded us of a quaintly named pastime which used to be—perhaps which is—a favourite one with the youth of England. A board having been set at an inclined plane, you pushed with a miniature cue a glass marble up a sort of alley, the top of which it occasionally failed to reach. But when it had reached it, and turned the corner, its troubles began. Apparently the laws of gravity might be relied on to conduct it to the bottom of the board, where its haven was; but the way was beset with many cunning brass pegs, against which the poor marble was not merely sorely bumped and buffeted, but also deflected out of its path. To the philosophic eye, Her Majesty's Government recalls that marble very strongly, both in its apparent inability to govern its own course, and in the vicious way in which the pegs seem to present themselves in all directions to affront and justle it. During the last few days four at least of these impediments have risen up in its way, and the afflicted marble has either rolled from one to the other, chipped and bruised by each, or is in imminent danger of similarly unpleasant contact. There is, first of all, the exceedingly angular and awkward *offendiculum* known as the Bradlaugh business; there is, secondly, Mr. Forster's celebrated anonymous Bill; there is, in the third place, the remarkable proposal of Mr. Dodson in reference to vaccination; while in the background rise a whole group of threatening obstacles, each worse than the other, and each raised by the Home Secretary's Hares and Rabbits Bill. Among these the Ministerial marble conjugates the verb "I am bumped" in all tenses—past, present, and future; and it is by no means certain that the future will not be the unpleasantest tense of all.

As for the Bradlaugh debates of Monday and Tuesday, and their result of a Ministerial minority of forty-five in a House where there is a normal Ministerial majority of a hundred, it is difficult to rise to the height of that catastrophe. Like almost all great defeats of the kind, it was preluded by a defeat in debate almost as remarkable. The balance of debating power in the House of Commons can hardly be said to be equal by the most devoted antagonist of the Ministry; yet the cause was so bad a one that, save Mr. Gladstone and Mr. Bright himself, hardly any champion on the Ministerial side made anything like a fight. As for Mr. Gladstone, his very able address may be said to have resolved itself into the following plaintive appeal to the House of Commons. "*We* don't mind evading difficulties and taking back ways, and why should you be so particular?" But Mr. Bright's appearance on Monday made up for this by anticipation. After all, the Chancellor of the Duchy of Lancaster is the man for an occasion like this, where the tactics obviously are to hit out all round and never mind fouls. Mr. Bright had not been long on his legs when, to borrow the words of a famous legend, "bang! went" the justice, generosity, and Christianity of the Opposition at a single blow. We always knew

that all Tories were liars; but we had thought that some filthy rags of the other virtues were possibly left them to cover their nakedness. Not a bit of it. The vigorous grasp of Mr. Bright has torn off these lendings, and the Tory stands in his nude and native blackness. But, to do Mr. Bright justice, his speech was not built wholly on party lines. The working classes, he says, generally care as little for the dogmas of Christianity as the upper classes do for the practice of the virtues it inculcates. This is something like a swashing blow. At one swoop Mr. Bright divests the poor of their faith and the rich of their works, and leaves British Christianity in a state which even the Tory, maltreated as he is, may regard with compassion. A member of Parliament and a Cabinet Minister must, we suppose, be counted among the upper classes; and, if so, we must admit that Mr. Bright is, as regards one at least of the primary Christian virtues, a very fair example of the doctrine he lays down. But there was one part of the orator's utterance with which we have the pleasure of agreeing most cordially. These were the occasions, he said, "which try men," and we can readily believe that the occasion is an exceedingly trying one, at least to the Government. The division of Tuesday was as much a direct Government defeat as if Lord Richard Grosvenor and Lord Kensington had been in the places of Mr. Labouchere and Mr. McLaren. It is not dignified for a Government to come in at back doors like thieves and robbers; but for a Government to try to come in at back doors and to fail, and to be upset into the *immunditia* that are wont to lurk about such places, into the bargain, is truly a painful fate.

Yet this painful fate, unfortunately for those who suffered it, has plenty of background. The nameless Bill and the Vaccination Bill and the Hares and Rabbits Bill have not yet resulted in any actual division against the Government; but they have already added to the list of eccentricities which make even their supporters shake the doubtful head and droop the saddened eye. Of all the quaint documents that ever issued from the Parliamentary press, the Bill which once was a clause, and is now we can hardly say what, perhaps presented the quaintest appearance in the shape in which it was first given to the world. If we wielded Mr. Tenniel's pencil instead of the humbler implement lent by the grey goose, we should like to depict Mr. Gladstone as Macbeth addressing Mr. Forster as a promising witch, with the obvious legend appended, "What is't thou bring'st? A Bill without a name." Though indeed the name of that Bill, if not that of its too modest sponsor, is not hard to fix. The name of that Bill is Robbery, and it is closely related to several more robust children of the same family which have been openly and manfully fathered by certain Irish members. Mr. Parnell and his friends are anxious that the Legislature should make all Irish tenant-farmers a present of so many years' rent out of their landlords' pockets. Mr. Forster (or the nameless one, whoever he is) is anxious that only certain scheduled counties should confer this precious privilege on their inhabitants. But the counties are not fixed by any hard and fast line, and with a little steady effort on the part of the Parnellites they can doubtless be multiplied. We can only say that, if English and Scotch landlords do not give the Government another rebuff as hard as the Bradlaugh one, it will be strange. And this brings us to yet another rock of offence to which the unfortunate Ministerial galley is hurrying, and that is the Hares and Rabbits Bill. The blast of that dread horn which Sir Charles Trevelyan blew in last Monday's *Times* ought to warn them of the consequences of the collision. *Malo mori quam fœdari*, says Sir Charles, in the most delightfully feudal style, and he continues to state that "in every age it has been the custom to begin by rendering weak and contemptible those who are intended to be victims." These, be it remembered, are the words of as stout a Liberal as these kingdoms contain. But if it will render the landlords of England weak and contemptible to be made to go shares with their tenants in their own rabbits, how much more will it make them so to be made the instruments of robbing their Irish brethren? Between the nameless Bill and the Bill which bears the name of Sir William Harcourt we fear that many a brunt awaits the hapless marble. Last of all in our present list—present we say, for the best of Ministries takes care to provide a new one every week—comes Mr. Dodson's superlative Vaccination Bill, the Bill which provides that when an anti-vaccinationist has been adjudged to pay the full penalty once, or any penalty twice, he shall thenceforward go uninterfered with. In this sublime proposal, often as the Government have disappointed us by taking a fresh flight, we cannot but think that even they have reached their apogee. The anti-vaccinationist is to be punished, but he is not to be prevented. Some shillings are to be taken out of him, but then he is to be at liberty to "murder the country" at his will and pleasure. We have only one suggestion to make, with the utmost respect for the President of the Local Government Board. If his excellent measure be carried, we trust that there may be issued placards like those now used to indicate beer and tobacco licences, and bearing the Red Cross and the words "licensed to spread small-pox." At the second conviction, these should be affixed to the anti-vaccinationist's door, that the rest of the population may at any rate be enabled to give him the widest of berths. But ere that day we think that, in the modest language of M. Veuillot, we can promise the Government "des sensations."

Amid these rocks of ridicule, or worse, our poor marble blunders about, a sight to draw tears from iron eyes. But there is one little point in which the comparison does not hold good. It is not the fault of the marble that it gets into these uncomfortable situations; and we fear it is the fault of the Government. No *force majeure* obliged them to hesitate and muddle, to palter and evade about the Bradlaugh matter, until at last the majority of forty-five at once rebuffed them and left them in a worse difficulty than before. They are not, as far as we can see, under any physical or moral compulsion to mulct the English landlord of half his shooting, or the Irish landlord of the whole of his rent. They certainly need not have executed the extraordinary series of evolutions which ended in the appearance of the nameless Bill. Nor can we think that accident or the higher powers forced on Mr. Dodson the sublime proposal of establishing licensed nurseries for small-pox. In this last case indeed, if in no other, it must have taken much study, many weary hours of thought, before even such a Ministry can have arrived at such a pitch of folly. The explanation must be sought elsewhere, and we fear it can be found only by reference to the instructive literature of burlesque. In the celebrated voyage undertaken by the Bellman and his crew it will be remembered that the bowsprit occasionally got mixed with the rudder. We suspect that in the Government vessel this difficulty has occurred, and has been obviated by doing away with the rudder altogether. Certainly there are singularly few signs of guidance in the extraordinary progress which that vessel makes, or rather does not make. Judging by the way already made, the House of Commons will have to sit till Christmas, and even that will be no good. If Bills are to shed their clauses, polyp fashion, into other full grown Bills at a moment's notice; if every crotcheteer is to be licensed to carry out his crotchet at the peril of the nation for a few shillings; if Select Committees are to be appointed and reappointed to contradict each other, and the House is then to be requested to ignore both, the cheerful earth will not soon be seen by the weary crew. Or, to recur to our first parallel, it is to be feared that the marble will be so bumped and chipped, and will find itself lost so inextricably among the ever-multiplying pegs, that it will never get to the bottom of the plane at all.

MOVING.

The Feast of St. John the Baptist has for a large number of English people a not wholly festival aspect in virtue of its character as one of the usual quarter-days. In various outlying parts of Europe the day is celebrated with rites, nominally perhaps dedicated to the saint, but really surviving from præ-Christian, it may be from præ-Aryan, forms of society. In our centres of commerce it is kept with much balancing of accounts, and the sacrificing priests are the bankers, through whose convenient ministration leaseholding customers are wont to discharge their Midsummer rent. But Midsummer brings to a certain number of householders a more exacting and visible solemnity than the depletion of their banking account by a simple act of transfer. If we will be oracular with Dogberry, we may say that to pay one's rent is the gift of fortune, but the end of a lease comes by nature. And he whose lease is ended must needs find some new shelter, which, paying his rent and performing his covenants, he may call his own for a certain term of years. There are those, too, who leave their habitations before the time, being straitened in them either in fact or in fancy, waxing ambitious in prosperity, or penurious in adversity; spurning an unfashionable quarter, shunning the expensive honour of the situations described by house-agents as having "an eligible address," or seeking elbow-room for growing children. Of these it may perhaps be said that they have turned their houses inside out by their own wilful act, and that any inconvenience they suffer in passing from the old dwelling to the new must be reckoned to their own folly. Nevertheless pity, though disallowed by the Stoics and some other severe philosophers as a weakness not befitting the character of the wise man, is human. *Mentem mortalia tangunt;* it were too nice an exercise of critical justice to inquire whether the flitting and dispossessed householder on whose condition we moralize has been brought into his troubles by mere inevitable effluxion of time or by his own anticipation of the fates. We call the operation a *move*—a term coming short of the gravity of the subject, though perhaps as pregnant and sonorous as a monosyllable allows. The French *déménagement* is more apt, perhaps because more imposing; to ears sharpened by experience its five-syllabled march has in it something of a rumbling to and fro, of groanings of furniture, of pushing, hammering, and scraping, of bare boards, of half-unpacked cases, of the materials of civilized habitation resolved into their elements and lying in heaps, of desolation and dislocation.

The helpless and exiled condition of the housefather to whom a child is born has for long years been a theme of irreverent mirth to flippant and irresponsible scribblers, presumably bachelors. Far more helpless is the state of the householder on the move, but less noticed by those whose occupation is to make sport for the public of the sufferings of mankind, perhaps because in this case the sting of envy is absent. He is for two or three days as it were an uneasy and infirm Colossus of Rhodes, having one foot in each of two houses, and neither secure. His fortunes are embarked in the hazards of a furniture-remover's van. There are moments when the possession of his most necessary and personal belongings is no better than a mockery and a legal fiction. He possesses them, as the civilians say, *animo*, but corporally they are as inaccessible to sense and use as if they were on the wrong side of the moon. What avails it to be bidden forth

to dinner, and to be the lawful owner of a dress-coat, boots, and all other garments and things to that function appertaining, if the coat is in West Kensington, the boots in Bloomsbury, and the shirts *in transitu* somewhere in the Bayswater Road? The master of all these appliances of an oppressive culture is barely master of that which he stands in (having, indeed, not much to sit down upon while the great process of removal is pending), and is happy if there is open to him some hospitable door within which that ambiguous formula "Dress as you please" really means what it says. Happier yet is his lot if that door, set apart from the din of London traffic and the frowning bulk of the furniture van, looks out on some sunny and wholesome prospect of English country; happiest of all if, not to him only, but to his innocent offspring, it opens a wide harbour of refuge during the days of anarchy, and makes them remembered only as a holiday-time interpolated in the common order of lessons and London walks by a mysterious and benignant dispensation. Then he knows the worth of that saying of the poet, forgotten or passed over as commonplace when the round of life goes smoothly, "Eines Freundes Freund zu sein," and, gladly obedient to Schiller's precept, adds his voice of grateful jubilation to the general chorus of those who are still simple enough to enjoy life and think well in the main of their fellow-men.

But we have spoken of compensations out of the common run, say of delights. Such relief, worthy of much thanks, does not fall to everybody. Not attaining this, the houseless man may in a lower way be content if his daily work lies not in his house. If it be otherwise, if he has a favourite study table, and if his club cannot offer him a good working library, his fate is too pitiable to dwell upon. He stares and gasps at the chaos that has swallowed up his familiar dispositions. The table in a new room, in an unaccustomed light; its drawers jammed against the legs of other tables upside down, and crowded by the corners of packing-cases; its inkstand vanished; the writing chair in the furthest corner, fenced about with fenders and rolls of carpeting—these things dismay him and freeze the current of the soul. Probably there are some who in such a case throw themselves upon the Consolidated Fund, and make the Reading-room of the British Museum their port of refuge for a season. It is said, moreover, that a stylographic pen and half-a-dozen post-cards in the pocket will afford a certain amount of moral support. But the frequenter of an office or chambers has a better comfort than this. He is not a tottering two-legged Colossus, but a Manx tripod with one of his three feet on solid earth. The place of business which at other times, perhaps, he has looked on as a mere workshop appointed for needful and unloved toil, assumes a homely and welcoming air. Here at least he has a few square feet of space and some hours of time in which he knows where to lay hands on the common objects of his interests and occupations; here he tastes the joys of a free chair and an unincumbered table. Not for long, however, can he thus flee from the evil day. The field of action calls for his presence; books and bottles, those two peculiarly manly cares, lie stacked and packed as the remover has left them, demanding assignment to their fitting places. Then are prepared for the lord of an unhanselled house and newly transported goods, according to his tastes and the bent of his apprehensions, hours of anxiety and minutes of anguish. He groans for the rude shaking of the wine he has tenderly laid down, or sighs over the wounds and bruises of his cherished volumes. A book-lover involved in these catastrophic adventures goes over his books, as he lifts them from the cases into which unhallowed violence has thrust them, like an officer counting his men after an engagement. One well-known comrade after another comes up with battered corners and scratched sides. Meditating sadly on the responsibilities of ownership, their master establishes a hospital tent for them in some corner where they will at least not be trampled on, till such time as their excoriations can be healed or palliated by judicious application of the gum-brush. As for the *biblia abibla*, prize-books, leaving-books, gifts of well-meaning relations in schoolboy days, partly of the heavy edifying kind, partly remnants of unreadable travels bought up by astute booksellers to be retailed for these purposes, Mogg's Patagonia or Logg's Mountains of the Moon, these emerge unharmed and unabashed. Nothing and nobody hurts them; their greasy yellow calf binding and tawdry gilt backs (do booksellers at this day perpetrate such enormities?) are clad in their own shabby smartness as in armour of proof. Meanwhile other and equally welcome discoveries are being made in other regions. For weeks the builder's men have been diligent in pulling the house to pieces under the directions of an eminent surveyor; not a drain-pipe, water-pipe, or gas-pipe has been left unexplored. At the last moment a mysterious outbreak of damp in the room that has been specially chosen for a linen-cupboard throws out all the plans of domestic arrangement; or an innocent-looking stove is found, instead of sending its smoke into the nearest chimney, to drive it through a deviously winding and descending flue, which is carefully led under an unprotected flooring of deal planks. Thereupon ensues hurried consultation with the eminent surveyor, and a violent recrudescence of digging, picking, hammering, stamping, trampling, cementing, plastering, tarring, and painting; the whole, as by long prescription of right accustomed, being once more enveloped and glorified in a nimbus of London dust. Then the new water and gas apparatus, which have been tried with the utmost satisfaction, are sure to break down on the very day when the house is first occupied; the water will not run where it ought, and runs everywhere where it ought not; or a particularly ingenious automatic arrangement for lighting the gas-lamp in the hall is found to be chiefly effectual for cutting off the supply of gas from all the rest of the house.

It is said that great emergencies bring out the deep and primitive traits of human character which in ordinary circumstances are overlaid by the routine of civilization, as men in delirium will speak in forgotten languages or recall in every detail the long mislaid remembrances of infancy. And in this case it is seen that the harried householder reverts to the bachelor ways of club life, it would seem neither willingly nor unwillingly, but under a fate stronger than himself. Nor in this does he meet with any reproach from the club-hating sex, but is encouraged, nay driven, to conduct which at other seasons is denounced as barbarous and unnatural. For there rises in the feminine mind a corresponding impulse, but apparently of more primeval date, which makes for a kind of fearful joy in living in the midst of disorder, and feeding on orts and scraps; a relic, peradventure, of the days when the savage hunter left for the nutriment of his squaw merely the bones and offal of his prey, after she had cooked and ministered the feast to him. However this be, if the more civilized man, thinking to gain some little diversion in the general turmoil, should propose to his careworn wife an expedition to some comfortable and not too extravagant restaurant, his invitation will be sternly repelled. He will be told that the work is much too pressing, though all his inquiries fail to inform him what work is done on the new house in the later evening hours. And so he is commanded to betake himself to his club, while the womankind sustain themselves by strange methods of their own. It is not probable that the mysteries of those snatched and formless repasts, at which no male is allowed to be present, will ever be fully disclosed. It is darkly rumoured that they are in the nature of heavy teas, and that Chicago beef is their staple ingredient. But Nature has not wholly withheld consolation from the man who thus dwells in his own house as in an encampment. The hardships of camp life bring something of its licence in the one point of tobacco. Domestic ordinances against the weed are perforce relaxed while the rooms stand curtainless and carpetless.

THE POPULAR VIEW OF ATHEISM.

THERE can of course be no doubt that the exceptional prolongation and bitterness of the recent debates on Mr. Bradlaugh's case in the House of Commons did not arise out of the legal and constitutional questions alone supposed to be under discussion, but were due to the widespread hostility felt towards the opinions associated with Mr. Bradlaugh's name, or, as the *Times* puts it, to "the social and religious instincts of the House." One member quoted the familiar verse of the psalm about "the fool"; another protested against the atmosphere of the House being "tainted" or "polluted"—it does not seem clear which word was used—by Mr. Bradlaugh's presence; a third "shrank from contact with" him; a fourth roundly asserted that "the question was not one of law at all but of religion"; a fifth, in still worse taste, denounced the admission of a member "who repudiated not only the claims of our Royal Family, but the claim of the King of Kings." There are few popular sayings so delusive as that "there is nothing in a name"; on the contrary there is often everything in it. We cannot indeed in this instance exactly apply that other, and far truer, proverb about "giving a dog a bad name," for Mr. Bradlaugh has not shrunk—creditably so far to his candour—from giving himself the detested name of atheist. It is precisely from the fact of his having done so that the whole controversy has arisen. Into that controversy we do not propose to enter here. Our immediate concern is not with the claim of an avowed atheist to enter the House of Commons, but with the demonstration of hostility towards atheism which that claim has evoked, and its probable causes. Let us say at once that we have no desire to treat this widespread feeling of abhorrence of atheism with levity or disrespect, or to deny that it has a genuine religious basis, and may even point—as has been often and plausibly urged by theistic apologists—to a general consent of mankind in the acknowledgment of a Supreme Being. But that is clearly not the whole explanation of the matter. The name, as we observed just now, has a good deal to do with it. There are other members of Parliament, against whose fitness to be there no shadow of objection has been raised by anybody, who are credited commonly and not unreasonably with views which it is the modern fashion to designate Agnostic, and who are not understood to resent the imputation. Yet it is surely a truism to say that in nine cases out of ten Agnosticism is but old atheism "writ large." And it has come to be writ large, because it is gaining ground in respectable society, where the older and simpler designation carries with it—if we may borrow a convenient term from the logic manuals—an offensive connotation; very much on the principle that vice is said by losing its grossness to lose half its evil. The new nomenclature may or may not be an advantage; those who like to call a spade a spade will be disposed to regret it. But it is anyhow a fact, and it confirms our view of the importance attached to names. This may be illustrated by a parallel case. The words Theist and Deist, like the cognate derivatives Theology and Divinity, have of course precisely the same meaning, the sole distinction being that one is derived from the Greek, the other from the Latin. Yet deist is invariably used as a term of reproach, theist as a term of praise; the former suggests to ordinary apprehension a man who rejects revelation, the latter

one who believes in God. Not that those who so apply the words mean at all necessarily to imply that a "deist" does not really believe in God, or that a "theist" does really believe in something more also; but in speaking of a deist they fix their attention on the negative, in speaking of a theist on the positive aspect of his belief. And so, if a man is called, or calls himself an Agnostic, he is generally looked upon, not without a touch of compassion, perhaps, as in a condition of involuntary, if not sorrowful, perplexity; while an "atheist" is regarded as what the Prayer-book calls an open and notorious evil liver and blasphemer. There is supposed to be an air of insolent defiance about him, such as is shown in the current story about Mr. Bradlaugh and his watch which, whether true or not—and we believe it is still literally *sub judice*—illustrates fairly enough the popular conception of atheism. The report of Shelley's inscribing himself in a Visitor's Book at a Swiss hotel ὁ ἄθεος, excited far greater horror than anything in "Queen Mab" or the "Revolt of Islam." And there is just this to be said for the prevalent view, that a man who avows himself an atheist, and declines to take shelter under any of the polite sobriquets provided by modern conventionalism, does betray a determination to brave the opinion of society; but that is not exactly what is meant.

We suspect then that the popular antipathy to atheism attaches as much to the name as to the thing named, though it is of course a further question how the name originally attracted to itself this evil connotation. Buddhists, according to the general and probably correct belief—to which Mr. Gladstone referred in his speech the other day—do not recognize a Supreme Being, but they are not looked upon with at all the same feeling of aversion as atheists. That aversion however is not a growth of yesterday. Atheism was the favourite taunt hurled against the early Christians eighteen centuries ago by their Pagan persecutors, and re-echoed by the Jews, though it practically meant that they refused to worship idols; and the same charge had been brought five centuries before against Socrates by the Athenians. Dugald Stewart tells us that at one period of English history those who rejected the doctrine of apostolic succession were commonly branded as atheists. In the present day the term is often used, especially by women, as interchangeable with infidel; yet the two words have quite a different meaning. Nor is this loose and opprobrious use of language by any means confined to the vulgar. Joseph Glanvil was one of the ablest divines and most brilliant thinkers of his day, and it has even been said of him, not without considerable reason, that "the predominating characteristic of his mind was an intense scepticism." That is certainly the impression produced by his *Vanity of Dogmatising*—eventually republished under the title of *Scepsis Scientifica*—which at once gained him a place in the Royal Society, then recently established. Hallam describes him as "far more sceptical than Descartes or even Malebranche." But that did not prevent his writing another able work in defence of the waning belief in witchcraft, under the title of *Sadducismus Triumphatus*, which became far more popular and passed through several editions. We cannot indeed say of him what used to be said of the late Harriet Martineau, that he "would believe anything as long as it was not in the Bible," for there is no reason to doubt the sincerity of his faith in the Bible; but he considered that "things remote and long past are either not believed or forgotten, whereas these [preternatural portents] being fresh and new, and attended with all the circumstances of credibility, it may be expected they should have most success upon the obstinacy of unbelievers." But our main ground for referring to the work here is that Glanvil begins by commenting on the growth of disbelief in witchcraft then coming into fashion, and expressly denounces it as a sign and precursor of atheism. "Atheism is begun in Sadducism, and those that dare not bluntly say there is no God content themselves to deny there are spirits or witches, *which sort of infidels*, though they are not ordinary among the the mere vulgar, yet are they numerous in a little higher rank of understandings." Cudworth endorsed this view, and said that disbelievers in witchcraft might justly be suspected of atheism. In short, it is clear that for above two thousand years atheist has been found a convenient label to attach to any class of religionists, or irreligionists—if the term may be allowed—who had specially outraged the national sentiment and thus incurred popular odium. We may trace a certain analogy in the use prevalent in England not so long ago of the word Papist. It had an unpleasant sound about it, and conveyed to ordinary apprehension the same sort of notion of a person with something uncanny about him which prompted the sense of "shrinking" and "pollution" expressed the other day in Parliament in reference to Mr. Bradlaugh. Indeed we are not sure that the feeling has quite died out now, though the word Papist has been banished from polite society. It is a curious coincidence that at the very time this Bradlaugh discussion was in progress an angry meeting was held in Exeter Hall to protest against Lord Ripon's appointment as Viceroy of India, when one of the speakers is reported to have indignantly asked how the work of evangelizing the millions of India and bringing them back from the abominations of idolatry could go on—we must confess to having feared it had hardly yet begun—under a Viceroy "who worshipped an image." This orator evidently considered the idolatry of Papists as bad as the idolatry of Brahminists, if he did not consider it as bad as atheism. And we seem to detect in the eager disclaimers of some Roman Catholic speakers in the recent debate a desire to repudiate any analogy between their own case and that of Mr. Bradlaugh, which had not, however, that we are aware of, been imputed to them in any other sense than that the Parliamentary oath was formerly so framed as to exclude them also. In the last century, when John Wesley's preaching was beginning to rouse the wrath of ecclesiastical authorities, Bishop Lavington of Exeter published a little book entitled *The Zeal of Methodists and Papists Compared*, with the object of proving that the former were as bad as the latter, and thereby effecting a *reductio ad absurdum* of their whole system. And we have no doubt there are in the present day many excellent persons who would tolerate nearly all varieties of political or religious belief, but would feel equally and unfeignedly uncomfortable if they found themselves sitting next to either an atheist or a Papist. The difference is that, whereas the sinister meaning attached to the word Papist was peculiarly English, and must be accounted for from specialities of English history, the popular antipathy to atheism is confined to no age or country.

To cite a few examples of the opprobrious use of the name besides those already noticed; for it was not only applied by the Athenians to Socrates, or by the Pagans to the early Christians. In the *Æneid* it is used of the wicked Mezentius, by Cicero of Theodorus and Bion. Christian apologists retorted the charge on their Pagan assailants, and the champions of orthodoxy on heresiarchs. St. Jerome calls Eunomius, and St. Athanasius calls Arius, an atheist. In later days Roman Catholics and Protestants have freely flung the odious imputation at one another. Jesuit divines affixed the stigma of atheism on Erasmus and on Macchiavellians. Perkins affixes it on Jews, Turks, and Papists; Calvin on the Pope and Cardinals, Tycho Brahe on Aristotle, Luther on a usurer. Epicureans, Cabbalists, Socinians, Arminians, Mahometans, have all incurred the charge from their opponents. Spanish theologians branded their Gallican rivals, and Gallicans the Spanish, with atheism. Voet and Mersenne gave the name to the French deists, and Maréchal is said to have applied it in his *Dictionnaire des Athées*—a very rare work now—"to almost every eminent person who ever lived." We could indeed mention contemporary theologians who are much in the habit of insinuating that all who differ from them by a hair's breadth are only saved by a happy inconsistency from rank atheism. It is no doubt obvious to remark that a name, however stupidly or maliciously it may sometimes have been misapplied, which at all times and places has provoked so widespread and bitter a detestation must signify, or be universally understood to signify, something which is really detestable. And the fact may be plausibly adduced, as was intimated before, in evidence of that general consent of mankind which is one of the standing arguments for theism. But the inquiry thus opened out as to the true meaning of this popular repugnance to atheism, which is so strong as to make the very name an effective weapon of offence, is far too wide a one to be entered on at the end of an article. But we may at least remark that some atheists have done their best to provoke and justify the feeling. It becomes at any rate intelligible when a French atheistic writer of the day blandly assures us that "virtue and vice are the results of a current of electricity, and are natural products in just the same way as sugar and vitriol"; while a German writer of the same school, Hellwald, points the moral of such teaching in the cynically frank avowal that "the object of science is to destroy all ideals, and to show that belief in God is a fraud, that morality, equality, freedom, love, and the rights of man are lies." It would be absurdly unjust to hold atheists, as such, responsible for these and similar offences against the common feelings of mankind; but they may serve to explain, if they fail to justify, the popular estimate of atheism.

THE *ATALANTA*.

SOME traces of this vessel, real and not forged—as the inscriptions in the bottle and on the oar-blade probably are—may yet be discovered; but it is by no means certain that, if discovered, they will give any clue towards ascertaining the cause of her loss. It may be utterly impossible to gather from such wreckage as is likely to be found the smallest knowledge of the circumstances under which the vessel went down, and certainly it will tell nothing respecting the place of the catastrophe, as it will necessarily have drifted far. In all probability, the loss of the *Atalanta* will remain an unsolved mystery, and a variety of opinions respecting it will be held with that confidence which is always shown where nothing certain can ever be known. Although, however, certainty, or any approach to certainty, with regard to this calamity is at present hopeless, and seems likely to remain so, some facts are now known on which a reasonable conjecture as to its possible cause may be made. Information of considerable value respecting the *Atalanta* has recently been published, and from a consideration of this, and of the remarks of a writer in the *Nautical Magazine*, who obviously is well acquainted with that part of the ocean in which the training-ship was lost, we propose to show that there are grounds for a surmise respecting the cause of her loss. The information to which we have referred was contained in a brief account of the *Atalanta's* commission in 1853-58, when the late Captain Stephen Fremantle commanded her. This account is apparently the work of two naval officers who were in her during the whole of this period. Two men are likely to tell a story at greater length than one, and in this case the writers might certainly have been more concise with advantage. They have thought it necessary to give a description of the

these are now far better known than they were at the time when the *Atalanta*—or rather the *Juno*, to call her by the name she then bore—sailed in the Australian seas and the Pacific, and have been told of in many books of travel. The reader who, it may be presumed, is anxious to learn something of the qualities of the ship which has been so lamentably lost, has to wade through an account of the Pitcairn Islanders, the Polynesians, and the aborigines of Australia, which no doubt is accurate enough, but contains scarcely anything that is not familiar to all who have paid the smallest attention to the literature of travel. All that is really pertinent in this prolix narrative may be very briefly summed up as follows:—The *Juno* sailed from England in 1854, and went round the Cape to Zanzibar and Muscat. After leaving the latter place she had, when on her way to the Kooria Mooria Islands, to beat to windward against a gale, and, according to the opinion of all on board, behaved admirably. From the islands she went to Bombay, and thence to Sydney. Her commander became senior officer on the Australian station, and during a period of some three years she made many voyages in the Pacific and went to Java. In 1858 Captain Fremantle was relieved by Captain Loring in the *Iris*, and the *Juno* sailed round Cape Horn to England, arriving in November 1858. It need scarcely be said that during her commission of nearly five years, in the course of which she sailed round the world, doubling both capes, there must have been opportunities innumerable of judging the vessel's behaviour in gales and heavy seas. On this point the writers in *Land and Water* are fortunately explicit, when at the end of their long story they at last state what is really interesting. They say:—"The *Juno* was paid off at Portsmouth in December of the same year [1858] after a most eventful commission on a stormy, rough weather station, and it may be safely said few ships have experienced a more tempestuous one, and none could have weathered it better. The ship on all occasions behaved admirably, every one on board having the greatest confidence in her capabilities to withstand the force of any wind or any weather that could be brought against her." They also state that, in a tremendous sea which was encountered when rounding the south point of New Zealand, the "gallant little ship" behaved "as heretofore," that is, extremely well.

This evidence respecting the *Atalanta*, coming as it does from sailors who were in her during so very long a time, carries the greatest weight, and it should be remembered that it exactly coincides with that of other officers who knew the *Atalanta* at the time when she was a frigate. We are able ourselves to corroborate to some extent the statement of the writers in *Land and Water*, having had three years' experience of a Symondite frigate of almost precisely the same size as the *Juno*, and closely resembling her. This vessel, though faulty in some respects, was admirable in a heavy sea, labouring but little, and steering easily when the management of the helms of other vessels was a very difficult matter. It may be held as tolerably clear that the *Atalanta* was a good and safe ship in a sea, and the self-contradictory statements which have been published as the "evidence" of some ordinary seamen who were lately on board her may be altogether disregarded. A vessel which is easy in a sea may, however, be capsized by a sudden gust of wind, and it has been frequently suggested that this was the fate of the *Atalanta*. On this point one of the writers of the account is able to give information which is of the greatest value. He saw a vessel of the same construction hove down. "When down to 76 deg.," he says, "with her keel three feet out of the water, the masthead purchase block strops carried away, and there was no mistake about the spring up to her upright position when released; the blocks were afterwards stropped with her breeching hawser, and she was then hove down to 78 deg., the hardest heave being the last few degrees. Everything was cleared out of the ship, she was a mere shell." This fact certainly shows in a marvellous manner the stability of form of these vessels; and it need hardly be said that the capsizing of a ship of this kind is a most remote contingency. It could only happen if the main deck ports were left open, as in the case of the *Eurydice*, or if the ship were thrown absolutely on her beam-ends and stopped in that position long enough for large quantities of water to enter through the upper-deck hatchways. We should add that the *Atalanta* was even safer from capsizing than she had been when called the *Juno*. When she was commissioned as a training-ship her masts were shortened by some six or seven feet, and additional water-tanks were put into her. It may therefore be presumed, without any great assumption, that the loss of this vessel was not due to her capsizing or to her bad qualities in a sea. The supposition that she had not able seamen enough to handle her, which has been boldly put forward, may be dismissed as ridiculous. The authors of the article in *Land and Water* treat it with just contempt, and the writer in the *Nautical Magazine* pertinently observes that "a merchant ship of her tonnage would be considered well manned with twenty-four hands, all told," and that the *Atalanta* had a complement of forty-four able seamen, which number was certainly increased during her run in the West Indies. This writer, who is apparently a merchant captain of long experience, also dismisses the supposition that she got into a high Northern latitude and drifted into the ice, pointing out that Captain Stirling had every reason for keeping to the southward and for not taking a course which "not only sailing ships, but steamers when possible, avoid in winter." After thus dealing with one conjecture respecting the ship, the writer proceeds to indicate the possible causes of her loss. She may, he thinks, have come into collision with a dismasted wreck, or may have been taken by the lee in one of the furious revolving gales which are not uncommon in that part of the ocean which she had to traverse. The first danger is, no doubt, a very serious one; and the loss of the *Atalanta* may, as is suggested, have been caused by collision with the hull of a timber ship, scarcely more than awash, and therefore not easily seen. It must not be forgotten, however, that, owing to the extremely careful look-out which is kept, men-of-war run far less risks of collisions of this kind than other vessels, and that, by all accounts, Captain Stirling was the last man to neglect any possible precaution. With regard to the other danger, the writer in the *Nautical Magazine* gives his own experience, describing in a forcible and graphic manner what befell him when homeward-bound from Baltimore. When the vessel was near the forty-fourth degree of west latitude, a breeze from the south-east which had sprung up drew aft, but as the barometer was falling slightly, and as the sea had a curious disturbed appearance, all the sail that she could carry was not set. At nightfall "an unusual dark shadow in the north-west" was observed. As the night wore on the wind and sea got up rapidly, and at midnight a violent gale was blowing. While the main topsail was being taken in, the wind shifted from south-west to north-north-west "with the force of a hurricane," and for awhile the ship was in very great danger. The writer of the account—who, as we have said, commanded her—seems to think that the *Atalanta* may have had a similar shift of wind, have been taken aback by lee and sunk. We doubt the justice of his conclusion. With some indications of a revolving gale he does not seem to have obeyed the cardinal rule, and to have brought his vessel to on the tack on which she would have come up as the wind shifted. If such a mistake was made it was a most pardonable one; but it is not such a mistake as a careful captain of a sailing man-of-war in no way pressed for time would have made. It is permissible to suppose that, under the circumstances described, so competent a commander as Captain Stirling would have hove to on the starboard tack and have much diminished the risk of being taken by the lee.

To what, then, is the loss of the *Atalanta* to be ascribed? Possibly to a collision with a hull awash, as has been suggested; possibly to a fact which hitherto seems to have received scarcely any attention. Those who have speculated as to the cause of this terrible catastrophe, scarcely seem to have taken into account the age of the vessel. As a general rule, with a wooden ship age means weakness, and the *Atalanta* was a very old ship. It is scarcely necessary to point out the difference between defects of form and want of strength. A ship's proportions may be such as to make her easy in a sea, and at the same time she may be very dangerous owing to weakness. The seams of a very old vessel are wide, and many of her fastenings are often weakened. She is not necessarily unseaworthy, especially if she be built of teak, but the chances are against her being able to withstand exceptional gales in the stormy belt. Does it not seem to some extent probable, as we previously suggested, that the *Atalanta* worked terribly in a series of very heavy seas, and that at last her seams opened so much as to let in more water than the pumps could keep down? The vessel which could weather any gale in 1855-56-57, may have been extremely different in 1880. It seems clear that her shape was not such as to cause any danger in a gale, but her timbers may have been no longer fit to stand the tremendous strain. It would be absurd to speak confidently respecting the calamity of which at present nothing is known for certain; but it is permissible to point out probabilities, and it certainly seems to some extent probable that this ship foundered from weakness. As it happens, on this point the opinions of the most practical men are easily obtainable. It will be well if the Committee which has to investigate the circumstances relating to this disaster, asks the underwriters what the rates of insurance are for wooden vessels as old as the *Atalanta*.

EXEUNT MARTIN AND MACKONOCHIE.

ENGLISH life has been made conscious of a deep void. The great suit which has for so many seasons and in so many forms preoccupied so many Courts, alimented so many leading articles, comforted so many lawyers, distressed so many devotees, and ruffled so many dignitaries, is now no more—gone like the *Atalanta* down in the viewless ocean, with no one point of difficult interest, either ritual, or legal, or constitutional, over which it has ranged a bit nearer solution for its fourteen years of sinister existence. All that survives is the triumphant personality of Mr. Mackonochie, monarch of all he surveys, from the centre of St. Alban's, Holborn, all round to the see of St. Alban's, Herts, lord of the Church Association, and true Pirate of Penzance. Poor Church Persecution Company, "Limited"—limited indeed at last!—where be your spies now, your jumbles, your howls, your mashes of muddlement, that were wont to set the Judges on a roar? Not one now to mock your own sinning? quite chapfallen. The worst, too, is that you are finally done to death by your own dupe; the arrow that has pierced you was winged from the bird whom you have yourselves been so long plucking. Mr. Martin, at last resipiscent, and even like "a prophet new inspired," instinct with a fine spirit of irony, thinks it due to "the Christian friends with whom I have been associated, to state publicly that I did not leave them free

to act on their own opinion as to enforcing submission by imprisonment to the judgments of the Court in the former suit; but positively refused to allow my name to be used in any measures which might have that end in view." Cruel, cruel Mr. Martin! not content with preventing an association of Christian friends from perpetrating an act of vindictive cruelty against a clergyman whose worst fault was pig-headedness and his least virtue self-sacrificing devotion to his spiritual duties! In his own defence he actually reveals by his letter to the Bishop of London of what spirit those men have been into whose hands he had long since so rashly placed himself, and whom at last, with much difficulty as it would seem, he has succeeded in shaking off. Mr. Martin, as it appears from his own explanation, is a good, unlitigious man, who was induced to enter into the Courts on explanations poured into his simple ear that he was merely lending his name to a friendly suit to ascertain the law, to which either party, once it was ascertained, was anxious with prompt attention to conform its practice.

In Mr. Martin's innocent imagination Mr. Mackonochie, if the Judges should have bidden him so to behave, would have felt it a privilege to conform his ceremonial to the standard of Curzon or Bedford Chapel, and the leaders of the Church Association were no less eager, if only the path of duty led them in that direction, to don the chasuble, to light the lights, and swing the censer. *O sancta simplicitas*—and much long-suffering, we must add—as a good many incidents must have occurred during the almost decade and a half of litigation which could have hardly failed to provoke suspicion in the mind of the guileless prosecutor that the men with whom he was working were more like lambs of Nottingham than lambs of the true fold in their notions of seeking peace and ensuing it. All has, however, at last ended well. Mr. Martin has shown himself to be, if not a very acute and far-seeing tactician, at all events an honest and a charitable Christian gentleman; while the revelation which he vouchsafes of the persecuting acrimony of his former accomplices exposes more emphatically, because unconsciously on his part, the overbearing tyranny which underlies their ostentatious zeal for the Church's welfare. After all, the Protestantism of England might buy at a heavy price the substitution of crumpled surplice for silken vestment, and the unquestionable preference of the odour of concentrated school-child for the sweet smell of frankincense, if the consideration which was to be given in return should be that the great tolerant Church of England had to be handed over to the unforgiving vengeance and narrow ignorance of the men whom at last their own chosen mouthpiece and hero has been driven to disavow and to denounce.

Mr. Mackonochie has now some time for quiet reflection, and we venture to suggest to him a topic which he will find alike original and instructive. He has not only from time to time amused the world with fervid pleadings in favour of disestablishment, but upon one occasion he cast his ideas into the form of a Bill, which was not far short in burlesque wrongheadedness of the one of which Lord Elcho gave ironical notice, or even of the Government Bills for fining Irish landlords and propagating small-pox. Genuine Liberationists laughed at their would-be ally, and average Churchmen regarded the extravagance as a gratuitous aggravation of Mr. Mackonochie's practical offences. Still nothing worse befel the athlete of confiscation than temporary ridicule; while he was left free to fight out his peculiar views of worship, till now, after so many years of struggle, he finds himself, through the collapse of jurisdictions ecclesiastical and secular, sole master of the field, and on the broad way, if only he uses his success with wisdom and moderation, to secure solid concessions of guaranteed toleration. All this good luck has befallen Mr. Mackonochie, not only within an Established Church, but because he belongs to an Established Church. Does Mr. Mackonochie for one instant flatter himself with the vain delusion that, supposing the community at one of whose altars he ministers had been what is called "free"—that is, governed exclusively by its own members and officers in total irresponsibility to any external influence—he could have got off so thoroughly unscathed? Let him suppose that his own exuberant programme of ritual was, we will not say in the same minority, in reference to other forms of outward observance within a free Church, in which it actually stands within an established one, but even in a position which, while it was one of recognized and emphatic minority, far more nearly approached equality. In such a case can he be quixotic enough to fancy that he would ever have been permitted by free Bishops, free Synods, and free Courts to go on holding on to his own theories and defying his antagonists until he had reduced them, minority man as he was, to helpless confusion, with his position, emoluments, and exceptional practices intact?

When Mr. Mackonochie has duly digested this speculative question, he may turn his attention to another of a practical nature, and perpend whether even inflexibility has not its limits, and whether, without abandoning any fundamental convictions, or the exhibition of what are to him typal forms of worship, some reserve in the extent of that exhibition might not be conceded to the prepossessions of that large majority to whom his ritual, however edifying to its votaries, is most assuredly unfamiliar and startling, and therefore suspicious. But when once he has set to thinking he need not stop even at that point, for he may well ask himself what is the rationale of the edification which he offers to his followers. The worship question does not solely lie between the ritual of St. Alban's and that of the old proprietary chapel. The existing modes of worship, ceremonial or Puritan, are infinite; and the practical benefits of beauty, life, and unction, of which Mr. Mackonochie is reasonably the advocate—and particularly so as the body of worshippers to whom he ministers is mainly drawn from the poor or the lower middle class—can now, in the present more tolerant condition of social opinion, be reached without requiring exact insistence on the few salient particulars which—not the general grandeur and edification of choral and ceremonial worship—have been at the bottom of that long strife of which St. Alban's Church has been the battle-field.

The time has come when, even from his own point of view, concession by Mr. Mackonochie would be not merely safe but in the long run serviceable to his own cause, for it will be one not wrung from the donor by the thumbscrew. So we hope that no false pride will whisper to him to resist our friendly counsel with a *non possumus*, but that he will recollect that the free offerings of a conqueror may be magnanimous condescension, when these same things extorted from a beaten and persecuted man would only be a weak surrender.

BOUFFÉ'S RECOLLECTIONS.

An addition has lately been made to the literature of the French stage in the shape of an interesting volume called *Mes Souvenirs*, written by M. Bouffé, with a preface by M. Ernest Legouvé. In this preface M. Legouvé dwells upon the double life which most actors lead, and which was peculiarly marked in M. Bouffé's case. The passage in which he does this is a good instance of M. Legouvé's well-known and admirable style. The *Souvenirs*, he writes, have the merits of liveliness, ease, and abundance of anecdote; but they have one which is rarer, that of being a portrait, or rather two portraits. "Vous y verrez revivre deux hommes, dont l'un est admiré de tous, et dont l'autre n'est connu de personne; c'est Bouffé et M. Bouffé. Ils se complètent singulièrement l'un l'autre, par le contraste et par la ressemblance. Au premier coup d'œil, rien de plus différent dans Bouffé que l'artiste et l'homme; en réalité, ils ne font qu'un. L'artiste était verveux, nerveux, électrique, agité; l'homme est correct, rangé, sensible, honnête, patriarcal." He goes on to explain this double identity by saying that M. Bouffé represents "toute une classe, modeste mais très particulière, de la grande société parisienne; la petite bourgeoisie ouvrière." Many actors of eminence have begun their life behind a counter, in an artisan's workshop, or in a porter's lodge, but, children of Paris as they are, "ils ne ressemblent pas à cette petite race vaillante, laborieuse, gaie, active, probe et passionnée pour le spectacle, qui revit toute entière dans Bouffé." M. Bouffé's father was a carver and gilder, and at thirteen years of age the son became his apprentice and showed great quickness in mastering his calling. Two years later the father fell ill, and the future comedian took charge, with his mother, of the establishment, and conducted himself and it with so much judgment that he obtained the nickname of *le petit vieux*. Then he took, in his leisure moments, to private theatricals, of which he gives a very amusing account, and finally he went to M. Allaux, the manager of the Panorama-Dramatique, to ask for an engagement. The story of this first engagement is certainly worth telling, and, oddly enough, is quoted from the book itself in M. Legouvé's preface. M. Bouffé having got admission to the manager's room, was asked by M. Allaux what his business was. When he had stated this, the manager said, "What kind of parts do you want to play?" and he answered timidly and modestly that he thought comedy was his line. At this M. Allaux said, "Very well; be so good as to stand up there." With these words he pointed to a black board divided off into seven measurements of height. The first and highest place was marked "Premiers rôles," the last and lowest "Bas comiques grimes." M. Allaux told his visitor to stand under number seven, and as soon as he was in position exclaimed, "I knew it, you are too short!" M. Bouffé vouches for the absolute accuracy of his account of this odd interview, and adds, "Je n'ai pas grandi d'une ligne depuis ce jour-là." That such a superstition should have as much force as it still has is odd when one recalls the many names of great actors who have been physically small men. The same objection was made to one of the first of French comedians now on the stage when he began his career; happily it did not prevail either in his case or in M. Bouffé's. Just as the aspirant was going away Solome, the *régisseur*, appeared, asked what was going on, made M. Bouffé go through a scene, and induced Allaux to give him an engagement at once at three hundred francs a year. "Trois cents francs par an, c'était vingt-cinq francs par mois, les gages d'une cuisinière de second ou de troisième ordre! Mais enfin j'étais artiste!" Another curious incident, which in the same odd way is told both in the book and in the preface, occurred when the actor was playing an old "invalide" at the Cirque. Among the audience was the oldest inhabitant of the *Invalides*, who expressed a wish to see the player, which was gratified the next day. When M. Bouffé came to the old man and told him who he was, he was met with contemptuous incredulity, and it was only when he sang in his assumed voice a few bars of music belonging to his part that the real *invalide* recognized him and insisted on embracing him. The visit, says M. Bouffé, was not only charming in itself, but was also of great value as a lesson. That M. Bouffé was always thinking of his art and was prepared to sacrifice a good deal for it is proved

by many instances in his *Souvenirs*, the oddest of which, perhaps, was connected with his success as the Sultan Ababa-Patapouf in *La Petite Lampe Merveilleuse* (Aladdin's Lamp). The wig-maker kept him waiting till the last moment for his bald head, and when this arrived it was three or four sizes too large. There was not too much time to spare before the curtain went up, and the actor took his resolution at once. He called to the barber of the theatre, and, in spite of all remonstrances, insisted upon having his head shaved there and then, thus obtaining "la plus belle tête de Chinois que l'on pût voir, même à Pékin." To complete his make-up he had long nails *à la Chinoise* fastened on to his fingers. In connexion with the fact that the actor spared no pains to obtain a real effect, it is worth while to note that he had no sort of liking for what is now called "realism." On this matter he has something to say when speaking of Tiercelin, an actor whom he greatly admired, and who was accustomed to represent types of the people. "C'était la nature prise sur le vif, mais en quelque sorte poétisée par un artiste délicat; un *Callot* sous d'autres costumes. Enfin il n'allait pas prendre ses modèles dans le ruisseau, ainsi que le font aujourd'hui certains soi-disant *comiques* qui dégradent l'homme et l'artiste, car je soutiens qu'on peut être vrai dans le personnage le plus vulgaire sans être ignoble." The writer adds a reference to a well-known saying of Voltaire's, which is as true and valuable in intention as it is coarse in expression.

M. Bouffé's career was, as is well known, full of triumphs; but naturally it was not without some more or less disagreeable incidents. One of these was his passing a night in a police-cell among a crowd of rascals, in consequence of an imprudent piece of "gag." M. Manuel had irritated the Chamber of Deputies by some expressions in a speech of his which he refused to withdraw; a squabble ensued; and finally the President ordered M. Manuel into custody. It was reported, whether truly or not, that a colonel of *gendarmerie* who was present said to the sergeant in command of the detachment which was sent for, "Empoignez-moi cet homme-là!" M. Bouffé had in the part which he played that night to say several times, "Emparez-vous de cet homme-là!" and for this, at some one else's suggestion, he substituted the phrase attributed to the Colonel. The gag raised a storm of applause, and brought down upon the actor a commissary of police and two gendarmes, who kept guard at the wings and outside his dressing-room during the performance, and carried him off to spend the night in a cell, of which he gives a horrible description. Among other misfortunes immediately connected with his dramatic life was an insurrection among the people who were employed underneath a canvas sea to give motion to the waves, and who, when the actor plunged into the boiling flood, managed matters so that when he reached the ship at which he was aiming he was black and blue all over. On another occasion a company of English pantomimists suddenly struck work, and the pantomime was carried on for some time with this remarkable cast:—

Colombine	Déjazet.
Arlequin	Armand Villot.
Cassandre	Dubourjal.
Le Clown	Bouffé.

In this part M. Bouffé had to take the harlequin's leap, or, in his own words, "me jeter à corps perdu dans une trappe anglaise, invention diabolique, dont les deux vantaux se refermaient par des ressorts qui ne laissaient que bien juste la place pour passer. De là, j'allais tomber dans une toile, que quatre hommes tenaient par les coins." One night one of the four men was slightly intoxicated, and the result—it was lucky that it was no worse—was that M. Bouffé fell headlong on the flooring and got a nasty cut on the head. In the course of the same piece Dubourjal, carrying him off the stage, let him drop heavily, and this time the consequences were more serious. Mathieu, who took the place of the invalided Bouffé, nearly died of an inflammation of the lungs; and altogether it is not surprising that M. Bouffé exhibits little enthusiasm for English pantomime.

M. Bouffé's recollections abound with anecdotes of this kind, as well as with reflections of a more serious character. We could wish that he had said more of the art of which he was in some lines a perfect master; but, in default of this, he records for us some curious observations of Potier's, made after he had seen Bouffé play a particular part. "It is not bad," said Potier, "but it is not what it ought to be. Your feeling and your fire win you the applause of the public; but I want something more. I want *la vérité vraie*—that is, I wish to see, not the actor interpreting the author's words with intelligence, but the actual personage whom the author has described; I want you, in short, to make me forget that I am in a theatre. To do this you must forget yourself that you are playing, and that you have learnt your words by heart; in fine, you must forget altogether (whatever certain professors may say) that you are Bouffé." The curious in such matters will do well to compare these instructions with the different opinion given by Diderot and more lately by M. Coquelin. To our thinking, Diderot is in the main right and Potier wrong; but no doubt there have been actors of great merit who have relied on complete self-forgetfulness, and appparently Potier was one of these.

MILITARY DRESS AND EQUIPMENT.

If we remember aright, it was the immortal Major Monsoon who feared that the abolition of pigtails would undermine the efficiency of the army. The gallant Major was, however, only a type of the military spirit of the day, which in those times was so ultra-conservative that the alteration of even a button was regarded with feelings of mistrust and aversion. What would he then have said if he had been informed that the sacrilegious hand of reform had dared to attack that time-honoured and cherished institution known as pipeclay? Yet so it is; for we are told that in the equipment which has been finally approved for the army, pipeclay is made to give way to brown leather belts. Pipeclay had a moral as well as an actual existence, and in both points of view it may be said to be "played out." Its moral aspect represented devotion to the past, love of formality and detail, and jealousy of change. Its physical aspect represented the white belts and accoutrements to which long familiarity has accustomed us—an appearance which, however pleasing to the eye of the civilian, was only attained at the expense to the soldier of much tedious, unwholesome, and incessant labour. We have, indeed, heard it said that pipeclay would have been disestablished long ago, had it not been pointed out that without it the men would have literally nothing to do. This may have been true of the soldier of the past, but certainly does not apply to the soldier of the present.

The abolition of pipeclay is, after all, only one of the numerous changes which the altered circumstances of modern war have necessitated. We appear, in fact, to have arrived at a state of perpetual change, for no sooner is one improvement effected than it becomes obsolete, and has to be replaced by another. During the last quarter of a century Brown Bess has been superseded by the Enfield, the Enfield by the Snider, and the Snider by the Martini-Henry. Each change of weapon has, as a rule, involved some change of equipment; but this would be but a slight matter could we only determine on a suitable dress for the soldier. It is said that when George IV. was once inspecting some proposed alteration in the dress of the cavalry, he sent for a trooper who had served at Waterloo, and asked him how he would like to be dressed if he had such another day's work to go through. "Please your Majesty, in my shirt sleeves," was the unhesitating reply. The truth is, that military dress aims at the impossible—namely, to reconcile the hopelessly antagonistic requirements of parade and work. Let us glance for a moment at the sailor. His dress of to-day is the identical one he wore a hundred years ago, and will in all probability wear a hundred years hence. It combines every possible desideratum both for the taxpayer and the wearer, being inexpensive, loose, comfortable, and serviceable. Any alteration necessitated by extremes of climate is easily and quickly made, and altogether, judging from the stern test of experience, it may be said to be well-nigh perfection; in proof of which, we may add that it has been copied by every nation which possesses a navy. But, be it observed, it makes no attempt at parade. The blue jacket when on shore is always neat and tidy, but never conspicuous. If, as he passes, you turn to bestow a second glance on him, it is the man, not the dress, that has attracted you. The dress of the soldier is exactly the opposite of this in every respect. It is costly, tight-fitting, uncomfortable, and eminently unsuited for physical exertion. We remember once to have seen a company which had just received their new tunics compelled to leave the rifle range and return to barracks to put on their shell jackets because the men were literally unable to bring their rifles up to the "present." Many of our readers who saw *Punch's* picture of the gallant Hussar who was unable to stoop to pick up a lady's handkerchief may have thought it a little exaggerated; but it was nothing of the kind. The close and accurate fit which is considered necessary for the soldier forbids the addition of underclothing in cold weather, and he is reluctant to don his greatcoat, because he knows that to fold it again correctly for the next marching-order parade will involve half an hour's labour. This may seem absurd, but it is perfectly intelligible. The moment a soldier quits his barrack he becomes the most conspicuous figure upon the scene. His dress, his gait and deportment, are all noted and criticized, and military experts will tell you that they can always recognize a smart regiment by the mere appearance of its men in public. But, as we have said, this appearance is purchased at the price of utility. It must be allowed that the helmet, to begin with, is certainly an improvement on the shako; but that is nearly all that can be said for it, and it is not saying much. So long as the wearer maintains an erect position it is all very well, but at rifle practice, in skirmishing drill, or in attack formation, and, above all, in actual action, the position of the soldier in these degenerate days is seldom or never erect; on the contrary, he is generally lying flat on his face, in which position the helmet has an awkward knack of falling over his eyes just as he is taking aim. We are quite aware that on these occasions the helmet is seldom or never worn; but this only induces the question—of what actual use is it at all, especially when it is remembered that it affords but little protection from the sun? The undress cap or Glengarry may be considered ornamental, but, as far as use is concerned, the soldier might as well be bare-headed, for it seems to be a point of honour to perch it immediately over the left ear, leaving the head almost entirely uncovered, the sole advantage it appears to possess being that of lightness. A change has just been author-

ized in the forage caps of infantry officers, and one which we think is a step in the right direction—namely, for ordinary wear a cap somewhat similar to that now in use, but with the old-fashioned drooping peak at present worn by the Guards, and for active service and peace manœuvres the Glengarry. In combined regard to appearance and utility, bearing in mind the contingency of sabre cuts, the cavalry are certainly more fortunate than the infantry, for both the Hussar busby and the Lancer cap are useful and fairly ornamental; but, to our thinking, the dragoon helmet, of burnished metal, and plume is the handsomest and most soldierlike headdress of all. Whatever opinions there may be as to the elegance of the tunic, which is the full dress for all services, there can be none as to its unsuitability for work, for the reasons already given. The undress of the infantry, or kersey frock, is looser and more comfortable; but it is kept in the background, as not being dressy enough. The cavalry retain the old shell jacket, which is as tight and close fitting as the tunic. Before leaving this part of the military dress we wish to draw another comparison between the army and the navy. In the naval officer's uniform the various gradations of rank and the different departmental services are all so plainly and clearly marked on the cuff of the coat, alike in full dress and undress, that any one, after a few hours' residence on board a man-of-war, can tell at a glance the precise rank of every officer, and, in the case of non-combatants, the department to which they belong. In the uniform of the military officer all is, in this respect at least, utter chaos. The gradations of rank are so vaguely and imperfectly marked, that a recruit cannot tell a subaltern from a colonel, a quartermaster from a surgeon, or a major from a captain. We hope to see this defect remedied before very long.

To return to the dress of the men, it may be said that the nether man in the infantry is more sensibly clad than the upper. His trousers and boots cannot by any stretch of the imagination be called either dressy or showy; but they are certainly serviceable, and easily put on or off. We wish we could say as much for the corresponding attire of the cavalry and artillery; but the fact is that, in the mounted services, everything is sacrificed to appearance. The breeches and boots worn in full dress and the overalls in undress are alike objectionable and unsuited to service from their excessive tightness, which renders it almost impossible to get them either on or off. We recently heard a cavalry officer, exhausted with the labour of pulling off a pair of wet boots, exclaim that, if ordered on service, there would be nothing for it but to rush off and buy boots three sizes too large for him. Exactly; but how about the privates? Now it is easy enough to inveigh against all this as sheer folly, and to indulge in unbounded indignation because that which is intended principally for show fails to satisfy the requirements of service when the time comes; but perhaps we must, with the soldier at any rate, sacrifice something to personal appearance in time of peace. We like to see our soldiers smart and well dressed; the public like it; the men themselves like it, and we should have but a poor opinion of them if they did not. Moreover, it is good for the members of any profession to have something on which to pride themselves. The sailor's pride is in his ship; the soldier's pride is, and has been from time immemorial, his personal appearance. We are not sure that it might not be as well frankly to recognize the impossibility of finding a dress suitable alike for peace and war, and to provide separate uniforms for each. The expense would not be inordinate, and the advantage would undoubtedly be great. It does not follow that the men are to go on service, as the gallant trooper before mentioned suggested, in their shirt-sleeves; but a loose, serviceable, and comfortable dress might be kept in store for them, to be issued when occasion demands. Let us now pass on to the subject of equipment. The old knapsack, with its arm-cutting straps and chest-impeding pressure, has passed away from the regulars, though it may still be seen in the militia. It has been superseded by the valise equipment, with the appearance of which our readers are familiar. This, we believe, is to be gradually superseded by the Oliver equipment, the principal advantages claimed for which are that the wearer can sit or lie down without shifting it, and can also open his coat on the march. More than this, it is so arranged that portions of the kit can be temporarily discarded and ammunition substituted, until a maximum of three hundred rounds per man is reached. This last is an important point, and would prove of incalculable advantage in cases where a general might wish to undertake a brief detached operation. A body of men carrying three hundred rounds each and foraging on the country they passed through, thus independent alike of ammunition and provision trains, would be something like a flying column. It should not be forgotten, however, that the experience of almost every campaign has shown that, if once the soldier and his kit are separated, they seldom meet again. The equipment of cavalry will probably have to be modified in conformity with the requirements of modern war. The use of the carbine increases while that of the sword diminishes. At present, as every one knows, the trooper wears the sword, while the horse carries the carbine in a leather case attached to the saddle. The result is that, if suddenly dismounted, the man retains the sword, which is then useless, while the horse goes off with the carbine, which would be useful. Before long this will have to be reversed, on service at any rate. Whether the bold dragoon, with his "carbine, saddle, and bridle," will find as much favour with the fair sex as his predecessor who carried a "long sword" is a point which the rapid march of military improvement forbids us to discuss. In conclusion, it is to be hoped that some means [illegible] devised for lightening the immense weight at present carried by troop-horses. So-called light cavalry, riding, according to [illegible] Garnet Wolseley, eighteen stone, are useless in modern war.

THE OPERAS.

THE first performance this season of *Lohengrin* at Her Majesty's Theatre marked an epoch in the annals of the opera in England. The English public were then shown that what they have hitherto been encouraged to treat as Herr Wagner's theories were at least possibilities. With Herr Wagner's latest instructions, Herr Richter came to England as an exponent of the music of the future, as it used to be called. That it has now become the music of the present was quite evident at the performance of which we speak. As yet, so far as Italian performances are concerned, we have been favoured with but a lame edition of the now famous opera, and it remained for Herr Richter to correct the innumerable mistakes which had crept into the orchestral score. No wonder, then, with the few opportunities given to the orchestra for practice, that the performance was delayed. Herr Richter evidently felt that it was useless to go to the public, unprepared as he was, with an incorrect score. Of course the reputation of the conductor alone was sufficient to fill the house on the first night, and we feel confident that, as far as he was concerned, no one left the theatre disappointed. It is really not too much to say that on this occasion the conductor was all in all, not only the orchestra, but the singers and the feeble chorus, being completely under his command. Without that fussy demonstrativeness so common among modern conductors, with no evidence of arrogating to himself undue prominence in the performance, Herr Richter conducts his orchestra with extraordinary power and skill. Nor is his attention bestowed only on this quarter; he even managed to make the chorus accede to his wishes, and by restoring the passage, too often barbarously cut out, between Ortrud and Telramund in the beginning of the second act, he not only made the story intelligible, but preserved a very fine piece of operatic music. It is perhaps a pity that he was unable to retain the passage of conspiracy between Telramund and the knights. We have spoken as we have done of Herr Richter's part in the performance because it was clearly shown that on the conductor depends to a much greater extent than on any other person the success or failure of the representation. Not only in giving us a good reading of the orchestral score, by making the points evident to the audience, but in attending to the various other exigencies of the singing of the principal performers, and subordinating his orchestra to their capabilities, lies one of the merits of this conductor. Mme. Christine Nilsson was the Elsa, a part in which she has always won applause, and upon this occasion she almost surpassed herself. Ortrud fell to Mlle. Tremelli, whose acting was very effective, while her singing was worthy of all praise. Signor Galassi's Telramund was well conceived, and Herr Behrens as the King declaimed with stateliness, albeit with a pitiful carelessness of intonation. Lohengrin was sustained by M. Candidus. Gifted with a beautiful voice, this singer nevertheless fails to attain the ideal of Wagner's Lohengrin. A want of chivalry in his manner and of command in his presence renders him incapable of sustaining the part with marked success. His first appearance on the stage with an impossible sword, which he used like a walking-stick, detracted largely from the sensation which ought to have been produced on his arrival; and the subsequent fight with Telramund, while either warrior strove to do the other the least harm possible, was absolutely ludicrous. Notwithstanding, M. Candidus's singing was very praiseworthy, and his rendering of the song to the swan and the music of the bridal chamber was excellent. To Signor Monti, who played the Herald, was due the exhibition on the part of the conductor of a singular instance of presence of mind. Whether it was the fault of any one else or of the Herald himself we know not, but when the time came for him to announce the coming marriage of Elsa and Lohengrin he was absent, and Herr Richter proceeded with the accompaniment to the missing Herald's proclamation without the least evidence of surprise.

The same opera was given this week with the same cast, except that Signor Arditi was in the conductor's chair instead of Herr Richter, and that Signor Campanini appeared as Lohengrin in the place of M. Candidus. Signor Campanini is at his best as the mystic knight: but Signor Arditi is certainly not at his best as the conductor of the mystic opera. The seemingly effortless strength and the marvellous delicacy of Herr Richter were painfully missed in the management of the orchestra, on which the German conductor appeared to play as if on one large instrument, every key of which was completely within his control and answered to his beat as the strings of the violin answer to Herr Joachim's touch. Mme. Nilsson's Elsa had lost nothing of its strange beauty, tenderness, and poetry; Signor Campanini used his admirable voice as he too seldom uses it, and gave a passion to his part in which M. Candidus was entirely wanting; Signor Monti had become better acquainted with his part, and the chorus seemed to feel more at home in their functions; and yet the absence of the one master mind and hand gave, to those who had heard the opera under Herr Richter's guidance, a curious and unpleasing flatness to the whole performance. Herr Richter, no doubt, had enough to do with looking after his orchestra, and Signor Arditi cannot be expected to busy himself in improving the stage

management of Herr Wagner's opera; but it is worth noticing that at neither performance has the true dramatic effect of Lohengrin's first arrival been approached, or even attempted. The exquisite effect of Mme. Nilsson's acting while she waits for this—a fine touch in which is Elsa's devout and unswerving belief, even when all seems hopeless, that help will come—is injured by the absence of that stir and tumult of passionate expectation and delight amid the crowd of warriors, which makes the spectator long to peer himself into the distance, and see what may be the portent which strikes men with amazement. This effect Mr. Carl Rosa gave when he presented the opera at Her Majesty's Theatre as finely as it is given, with far more facilities than were then at his disposal, on the German stage; and there can be no reason, one would think, why it should not be given under Mr. Mapleson's management. The crowd, however, trained no doubt to the conventionalities of Italian opera, point feeble fingers and give vacuous looks in the direction of the coming swan drawing the knight down the river, and betray no more agitation at his arrival than they might at that of a mass of weeds or a boat that had broken loose from its moorings. Again, when Herr Schott appeared as Lohengrin under Mr. Carl Rosa's management, the combat between Telramund and Percival's son was both simple and impressive, instead of being, as it now is, an empty knocking of swords on shields, ended by an ungainly and impossible pushing down of one combatant by the other. These are matters which can be managed even in the absence of Herr Richter, and it is irritating to find them entirely neglected.

Mme. Christine Nilsson, Mme. Marie Roze, and Mlle. Minnie Hauk were cast respectively for the parts of Donna Elvira, Donna Anna, and Zerlina at the first representation of *Don Giovanni*. It would be difficult to find better representatives for these favourite parts, and it is needless to say that, as to singing and acting, they were most ably sustained; had the other parts been equally well allotted, the performance would have been one of high excellence. Signor Del Puente's Don Giovanni lacks distinction and vigour, and though he sang the music with credit, his acting was half-hearted, while the Leporello of Herr Behrens, though well acted, was poorly sung. Signor Monti made a good statue and walked the stage in a sufficiently stony way, but Signor Lazzarini was hopelessly out of his element. In "Il mio tesoro" the last-named singer nearly came to grief, we hope owing to indisposition. The absurd business of the red imps dragging Don Giovanni down to hell has become, we suppose, a tradition, though on this occasion it seemed more ludicrous than ever.

The appearance of Mme. Eleanora Robinson in *Fidelio* was an event much looked forward to by the opera-going public. With the recollection of Mme. Titiens's superb acting, Mme. Robinson was heavily handicapped with the audience, but notwithstanding this her *début* must be considered a decided success. To a fine voice, and a stage presence almost worthy of her great predecessor, she has added a careful study of the part of Leonora. Her acting when she overhears the determination of Pizarro to kill Florestan in the first act, and again through the whole of the second act, was very fine indeed, and her singing of "O tu la cui," and in the duet with Florestan in the second act, showed her to be an artist of no ordinary merit. Mlle. Isidora Martinez made a sprightly Marcellina, and Signor Rinaldini acted Jacquino with credit. Herr Behrens was Rocco and Signor Galassi Pizarro. The Florestan on this occasion was M. Candidus, who played the part with considerable power. Especially commendable was his soliloquy at the beginning of the second act, and his singing in the duet with Leonora subsequently. The chorus of prisoners was perhaps the most unhappy part of the opera. They seemed to have lost their voices completely during their long incarceration, and to have been utterly unable to attain to the requisite pitch to render their singing acceptable to the audience, a piece of realism never looked forward to, we are sure, by the great composer of the opera. The third Leonora overture was played between the first and second act, and deservedly redemanded, a proper tribute to the excellent playing of the orchestra under Signor Arditi.

The *début* of Mme. Sembrich, of the Royal Opera at Dresden, was the cause of a crowded house at the Royal Italian Opera. The opera chosen was *Lucia di Lammermoor*, an opera which seems to be almost as great a favourite with *débutantes* as the *Sonnambula*. The scene on this occasion was one of great excitement for the eminently respectable audience at Covent Garden, for, from the first appearance of Mme. Sembrich—almost, we were going to say, before she began to sing—the applause began, which was continued at intervals through the whole of her performance. Mme. Sembrich possesses a voice of a pure sympathetic quality, of the kind termed light soprano, with a range of surprising compass. With apparently the greatest ease she produced the D flat in alt, and did not appear in the least discomposed when the audience redemanded the passage in which the *tour de force* occurred. Added to this she is a good actress, albeit she was a little wanting in repose, owing perhaps to nervousness upon her first appearance in London. She is certainly a great acquisition to the London opera, and we hope to see her in some part more worthy of her than Lucia. The applause she won was well merited, and her *début* must be considered a genuine success. Signor Gayarré was of course Edgardo, and his performance of the part was, as in all other parts that we have seen him in this season, very far from satisfactory. We have before mentioned the propensity that this singer shows to shout his part, and so marked was it on this occasion that there were distinct signs of disapproval from the region of the stalls and boxes. The fatal effect that this habit has upon his intonation was disagreeably apparent at this performance. In the scene when he appears upon the stairs suddenly, and in which Madame Sembrich showed herself a careful actress, Signor Gayarré played as if he had part to "tear a cat in"; his violence was beyond all bounds.

If Signor Vianesi would only take example from Herr Richter, and occasionally moderate the force of his orchestra, we might perhaps be spared even Signor Gayarré's shouting. Often we noticed that Madame Sembrich relinquished the attempt to make herself heard above the surrounding clamour, especially in the *ensembles*. Signor Cotogni's Enrico and Signor Capponi's Raimondo were both well-rendered parts, and Signor Sabater played Arturo with credit.

Aïda has been also performed this season at Her Majesty's, with Mme. Marie Roze as Aïda and Mlle. Tremelli as Amneris. Mme. Marie Roze shows in this part great advance as an actress, and was very successful in the difficult task of making Aïda of sufficient importance to attract the sympathies of the audience, and yet of playing the part in the subdued and quiet way which is necessary to the general effect of the opera. On the evening on which we heard her she was in by no means good voice, but yet sang most of the music extremely well. Mlle. Tremelli made a well-deserved success in the part of Amneris. Signor Frapolli was the Radames, and sang the part well; but his acting was marked by an unpleasant restlessness. The performance on the whole was fairly good. The band was very good, and the chorus on the whole accurate in time and tune, but without the least light and shade. Signor Arditi conducted well, though with a tendency to hurry the tempi, which nearly led to the breakdown of one of the ballets and one of the choruses. Mr. Mapleson has brought out a new soprano, Mlle. Lehmann, who has appeared in *La Traviata*; she has a voice of good quality, thoroughly well trained, and is also an actress of very considerable ability and power. We shall reserve further notice of Mlle. Lehmann until we have had an opportunity of hearing her in some more worthy part. Signor Campanini in this opera reminded us of Signor Gayarré in his worst mood. The chorus was far from good throughout; but the band, under Signor Arditi, was excellent.

It is now so long since *La Forza del Destino* was performed in London that its reproduction at Her Majesty's Theatre almost ranks as a novelty. Thirteen years ago Mr. Mapleson attempted to draw the attention of the English public to this opera, but without marked success. The libretto is unfortunate. An opera dealing with such deep contrasts of light and shade can never become popular, besides which the music is of such a hybrid nature as almost to raise a laugh. We were formerly told that the cause of the failure of *La Forza* was Signor Verdi's strong leaning to the Wagner school. Where this appears we are at a loss to discover, unless it lies in the fact that he is rather more noisy in this than in his other productions. We fail to find any one point in which his music may be compared to that of Herr Wagner. The story of the opera shortly recited is enough to show the cause of its failure. Donna Leonora has a lover, Don Alvaro, with whom she is about to elope, when her father intervenes, and is shot by an accidental discharge of Alvaro's pistol. She has also a brother, Don Carlos, whose one aim in life after this is to exterminate his father's murderer. Donna Leonora, retiring to a monastery, finally takes up her abode in a hole in the rocks, and Don Carlos takes service as an officer in a regiment in which Don Alvaro is a captain. Of course all have changed their names. Don Alvaro is wounded in battle, and delivers the key of his portmanteau to Don Carlos, with a request to him as his executor to destroy certain valuable papers therein contained. Don Carlos swears to do so, but is mean enough to examine them first, and discovers that the captain is the man he has been hunting all his life. Don Alvaro recovers and turns monk, but Don Carlos is not satisfied, hunts him up, challenges him to fight, and gets killed for his pains. Donna Leonora turns out to be the monk whom Alvaro has called up in the middle of the night to absolve the dying man, who, recognizing her, deals her a fatal blow in a death embrace. Side by side with this, there is a vein of comedy running through the piece. Mme. Swift, who was the Leonora, adds to a powerful soprano of a large compass a considerable knowledge of stage requirements; and her singing, especially of "Deh! non m'abbandonar," and "Sull' alba il piede" and of the long scene in the last act, was excellent. Mme. Trebelli played Preziosilla superbly, and created a sensation in the rataplan to her own drum accompaniment. Signor Campanini personated Don Alvaro, and Signor Galassi Don Carlos. The Fra Melitone of Signor Del Puente was refreshingly humorous, especially in the scene where he is ladling out soup to the beggars at the door of the monastery.

REVIEWS.

KOSSUTH'S MEMORIES OF EXILE.*

M. KOSSUTH is occupying his old age with the composition of reminiscences, which he publishes under the title of *Memories of My Exile*. A portion of the work has now been

* *Memories of My Exile*. By Louis Kossuth. Translated from the original Hungarian by Ferencz Jausz. London: Cassell, Petter, & Galpin. 1880.

given to the English public in the form of a translation from the Hungarian original by M. Jans. This portion is not published in chronological order, for it relates to the events of 1859, while a subsequent volume is to carry us back to the period of the Crimean War. For English readers it is advantageous that the later period of 1859 should be treated now, as Kossuth's memories relate to transactions which have been recently brought before them in the concluding volume of the *Life of the Prince Consort*. The present volume describes the efforts made by Kossuth to extend the war from Italy to Hungary, the partial success he achieved by enlisting the sympathies of the French Emperor and by securing the absolute neutrality of England, and the utter collapse of all his plans and all his dreams when peace was made at Villafranca. It cannot be said that there is much that is new in the version of affairs now given by M. Kossuth, if only general facts receive attention. For it is notorious that a Hungarian legion was formed or intended to be formed in Italy, and that Louis Napoleon and Victor Emmanuel in some shape assented to a proceeding which was at least meant to annoy and frighten Austria. But M. Kossuth is able to give many details, and sets before us clearly enough what he wanted. This was no less than an invasion of Hungary by French troops to assist a new Hungarian rising, with the object of forming an independent Hungary, the crown of which he very kindly offered by anticipation to Prince Napoleon. An independent Hungary has been the dream of M. Kossuth's life; and it was because, in the settlement which followed Sadowa, Hungary was allied on terms of equality with Austria, instead of being separated from it, that he would have nothing to do with the arrangement, and, as a protest against it, has remained an exile ever since. It is evident from the disclosures he makes in this volume that in his bargainings with France and Italy he never got near the solution for which he pressed. The French Emperor had no great military knowledge or ability, but he had too much sense to risk a large number of French troops far away from any base of operations, in order to create a new State the existence of which he would have to defend for years after he had created it. Kossuth was a dreaming, restless, unpractical man; but he had great eloquence and a sincere enthusiasm, and he exercised a great influence over popular assemblies and over some persons of political importance. But it is now many years since his influence faded altogether away. It was Deak, not M. Kossuth, whom the Hungarians followed in 1867, and he never after 1859 had any opportunity of playing even a trifling part in the politics of Western Europe.

M. Kossuth credits himself with not only having overthrown the Derby Ministry in 1859, but with having overthrown it by his own personal efforts, and in a method of his own personal invention. He was summoned to Paris at the beginning of the May of 1859, and on the night of the 5th he had a private audience with the Emperor. M. Kossuth has recorded with great minuteness all that passed on this occasion, and the dialogue which he represents as having taken place is quite as interesting as any of the conversations reported by Mr. Senior. The Emperor, after a friendly reference to Kossuth's earlier history, began by saying that he hoped to realize Kossuth's patriotic hopes, and that he understood that Kossuth, with whom Prince Napoleon had previously conversed, offered the co-operation of Hungary in the war on two conditions. One of them was that the Emperor should extend the war from the banks of the Po to those of the Danube and the Theiss. The other was that the appearance of French troops in Hungary should be heralded by a proclamation in which the Hungarians should be invited to rise in arms. M. Kossuth replied that his conditions could not be more accurately stated. The Emperor went on to say that as to the proclamation there could be no difficulty. He had, in fact, a proclamation in stock which had been framed by his uncle in 1809. The real difficulty was in sending the troops who were to give effect to the proclamation. The main obstacle was the English Ministry. The Tory Government, he said, "manifests a decidedly hostile attitude towards my enterprises even as regards Italy. The antiquated notion that the existence of the House of Hapsburg as a Great Power is essential to the maintenance of the European equilibrium is one of the traditional maxims of English policy." He added that he had reason to believe that England would even be capable of actually intervening against him. Kossuth answered by suggesting that England might be won over by the prospect of having Constantinople given her. On hearing this the Emperor, while he lit a cigarette over the lamp, which incident M. Kossuth records as giving piquancy and dignity to the reply, answered, "Il ne faut jamais vouloir l'impossible." Kossuth asked what the Emperor wanted. Did he hope for active co-operation from England? The Emperor assured him that he did not dream of that, and that all he wished was that her neutrality could be assured. After some speculation as to the probability of even the Tory Government proclaiming itself neutral, the Emperor answered that he should not feel satisfied as long as the policy of England remained in the hands of the Government then existing. Kossuth assented. "The place of the Tories should," he said, "be taken by the Whigs on such an understanding as would entirely secure the neutrality of England. As your Majesty only wishes thus much from England, permit me to declare that I will take upon myself the task to carry this into effect." The Emperor expressed some natural surprise, but Kossuth assured him he was serious, explained how he meant to set to work, and now explains to his readers how he actually accomplished what he had undertaken.

What he did was to go back to London and consult his friend Mr. Gilpin, the member for Northampton. The advice given was sensible enough, and was to the effect that nothing should be done until the elections then pending were over. It was decided that as soon as there could be no occasion for imputing to a foreigner the wish to influence purely English politics a series of public meetings should be held. The Lord Mayor was good enough to preside at the first meeting, which was held at the London Tavern, and introduced Kossuth on the occasion as "the last legitimate ruler of Hungary." Kossuth called on his hearers to resolve that the neutrality already announced by the Ministry should be absolute, or, in other words, that Austria should be left to fight her own battles whatever part of her dominions might be attacked. The same theme was repeated at Manchester, Bradford, and Glasgow, and it may be observed that the speeches made by M. Kossuth on these occasions are given in full in this volume, and form a considerable portion of its contents. Everywhere M. Kossuth found his audience in sympathy with him, and complete neutrality was as much to the taste of the hearers as of the speaker. The result of the elections showed that the Derby Ministry was in a small minority, but in order that it should be defeated it was necessary that the rival claims to leadership of Lord Palmerston and Lord John Russell should be adjusted, and that the whole majority should act together. The rivals settled their claims by deciding that the one not sent for by the Queen was to serve under the other, and the cohesion of the majority was assured by Mr. Gilpin getting for himself and his friends an assurance in writing from Lord Palmerston and Lord John Russell that, if in office, they would maintain neutrality even if the war spread to Hungary. The letters giving this assurance were handed to Kossuth, who carried them over to the Emperor of the French as a token of his triumph. These letters have been lost, and M. Kossuth treats their loss as a most serious misfortune. But he is able to produce a letter from Mr. Gilpin, who informs him that he has been offered the Secretaryship of the Poor Law Board, and that he has had a conversation with Lord Palmerston, in which he explained to Lord Palmerston that "several members of the Ministry not having been privy to what had passed between them, he felt sure that Lord Palmerston would find it natural that in the interests of those concerned (that is of M. Kossuth and his friends) further and explicit assurances would be welcome. Lord Palmerston said that he could give the fullest assurances, that Mr. Gilpin's Hungarian friends could set their minds perfectly at ease with regard to the conduct of England." Mr. Gilpin also writes that he has again spoken with Lord John Russell, and that he told Mr. Gilpin that he was quite prepared to go as far as Mr. Gilpin himself went. There can be no doubt that the new Ministry came into office pledged to maintain an absolute neutrality, even if Austria were attacked in Hungary. It is also incontestable that this pledge was given to friends of M. Kossuth who were acting as M. Kossuth wished them to act, But it does not at all appear that Lord Palmerston and Lord John Russell were adopting a line of policy that was in any way forced on them, or that they were taking a line that broadly separated them from the Ministry. Lord Derby, in reply to a deputation composed of friends of M. Kossuth, who said that all they wanted was that nothing should be made a pretext for violating the neutrality officially proclaimed, said that the views of the Government entirely coincided with the wishes expressed to him. And when Lord Derby announced in the House of Lords the resignation of his Ministry, he stated that "he was aware that the late Ministry had been overthrown, not on any one specific point, but on the broad grounds as to which party should hold office." There is no reason to suppose that Lord Derby was saying anything but the precise truth. It was on these broad grounds that Lord Derby's Ministry was overthrown, and must then or in a few weeks have been overthrown. To say that M. Kossuth had nothing to do with the defeat of the Ministry would be going too far. There are wheels within wheels; and, as there was only a majority of thirteen against the Ministry, any one who made even a vote or two safer by suggesting that a pledge should be given by the Liberal leaders which they had not the slightest objection to give may be said to have contributed to the downfall of the Government.

Having finished his business in London, M. Kossuth went off to Italy, where he was much wanted, as the war had begun, and a body of Hungarian soldiers was being organized to take part in it on the side of the allies. These troops were formed partly of Hungarian refugees, and partly of Hungarian prisoners of war; and so strenuous were the efforts made by the Hungarian leaders that in a few weeks the force numbered four thousand men. The Italian Government at first proposed to treat these Hungarians as men employed in the service of Victor Emmanuel for the term of the war, and the force itself was to be called the Hungarian Legion. But M. Kossuth and his friends resolutely and successfully opposed this. The Hungarians, they insisted, were to fight as parts of an Hungarian army marching through Italy to Hungary, or they were not to fight at all. This view so far prevailed that the men were allowed to fight under the Hungarian flag, and no oath of allegiance to Victor Emmanuel was exacted from them. No doubt M. Kossuth is justly entitled to the credit of having by his firmness prevented any attempt at a premature and abortive rising in Hungary. He gives an interesting account of a conversation he had after Solferino with the Emperor Napoleon, in which the Emperor agreed that M. Kossuth was taking the proper course for a patriotic Hungarian to take. Unless French aid were a certainty it was manifestly wiser for the Hungarians to keep quiet. M. Kossuth also thought he had convinced the Emperor of a further

point, that in order to finish the war advantageously the Emperor must venture on giving armed assistance to Hungary. If the war, M. Kossuth argued, is treated as a purely Italian war, Austria was sure to make a peace not very humiliating to her, would gain breathing time, and be soon as strong as ever, and bent on regaining all in Italy that she had lost. The Emperor expressed his full concurrence. There was the danger that if Hungary were raised the German Confederation might think itself concerned and intervene. M. Kossuth acknowledged this; but he pointed out that, if Austria pleased, she might protract the war indefinitely by relying on the Emperor's reluctance to provoke the interference of the German Confederation. She had only to withdraw her troops across the Isonzo and, if the French followed them, German soil would be violated. There was very much of truth in this remark, so much truth that what M. Kossuth called the thunderclap of Villafranca arose from the Emperor seeing how true the remark was. Either he must abandon the war, or he must sooner or later, and possibly very soon, bring himself into collision with the German Confederation. If he defied both the German Confederation and Austria, he must do all he could to cripple Austria by raising Hungary against her, and thus see her soldiers fight on the banks of the Danube and the Rhine at the same time. He shrank from this; and, as the ruler of France, he was quite right in shrinking. He decided on a sudden peace, drove Italy to temporary despair, and sent back M. Kossuth and his friends to weave anew the threads of the plots and schemes which occupy the time and thought of political exiles.

DAWKINS'S EARLY MAN IN BRITAIN.*

IN his recent treatise on the history of Early Man in Britain Professor Boyd Dawkins has sought to bring to a common focus the rays of light shed upon the primæval stage of human life by the sciences of geology, prehistoric archæology, and history. His earlier work on *Cave-Hunting*, published in 1874, and reviewed in our columns at the time (*Saturday Review*, November 14, 1874), was directed towards clearing away the obscurities which overhung what seemed to him the borderland between those respective fields of research. The history of the earth comes first in the inquiry, tracing the gradual preparation of continents or islands to form the home of man, to yield him food, and to meet his ever-growing wants. The archæologist finds him in rude caverns scooped out by nature in the hillside, which form his dwelling-place, his shelter from the climate, from wild beasts and savage foes, and often his resting-place in death. The wide research brought to bear upon this stage of human life, and the application to it of the purely inductive method of reasoning, have raised the study of prehistoric antiquity to the rank of a science. With the materials thus accumulated the archæologist may claim to have established, as our author does in his preliminary remarks, a tolerably complete sequence of events from the remote past in which man stands in the geological foreground down to the borders of written history. To the labourers in this province we owe the knowledge of the steps by which man slowly freed himself from the bondage of the natural conditions common to him and all living creatures. We can follow his progress through the successive discoveries of the use of polished stone, bronze, and iron, marking as these do most distinctly the three phases through which every race alike has passed in turn. We mark his earliest domestication of animals, his cultivation of the fruits of the earth, his first rude efforts towards the making of clothing, of weapons and implements, and his dawning sense of art—"in a word, all those things by which man has become what the historian finds him."

Glancing rapidly at the vast geological ages of the earth's history which preceded the Tertiary period, Mr. Dawkins takes up this as the starting-point for the determination of man's entry upon the stage of life. Throughout this period the evolution of life is definitely traceable, each group being linked without break with that before it, and the law of its continuity being made manifest by the gradual specialization of mammalian life from the Eocene times down to the present day. It has been held by high authorities that the presence of man can be traced in Europe as early as the Meiocene age, on the ground of flint splinters having been found in mid-Meiocene strata at Thenay, and a rib of an extinct kind of manatee found at Pouancé, in France, notched apparently by the hand of man. The inadequacy of these proofs is pointed out by Mr. Dawkins. Fitted as Meiocene Europe may have been as regards food and climate to become the birthplace of man, there was, he shows, no place for man as the most specialized of all creatures in a fauna most strongly marked by the absence of all the mammalian forms now associated with him. No living species of land mammal has been met with in the Meiocene fauna. Representatives of the order of primates (the Adapis, the Necrolemur, the Cœnopithecus, and other forms) have, it is true, been shown to have haunted the upper Eocene forests of both Europe and America; and in the Meiocene the anthropomorphous apes, such as Dryopithecus, are known to have been abundant. At the end of the Pleiocene age a remarkable disappearance of the quadrumana from Europe seems to have taken place, due in all probability to a lowering of the climate. From its outset the Pleistocene age exhibits a great contrast with the fauna of the preceding period. The greater part of the animals now living have here their place, and the world, our author urges, was then in the stage of evolution in which man might be expected to play his part. Migrations of the principal fauna of Europe then probably took place on a large scale, in accordance with the annual change of heat and cold, as well as with the longer secular alternations of climate, Great Britain being still connected with the Continent, the intermingling of the remains of arctic and tropical animals in British caves and drift being thus accounted for. The earliest trace of man's presence among the diversified fauna of this period is to be seen in the flint flakes manifestly chipped by human hands, of which our author specially cites one discovered under his eyes in the lower brick earth at Crayford in 1872, in which stratum he had previously unearthed the skull of a musk bull. Flakes of this kind abound in the later Pleistocene deposits, and whatever theory may be advanced in explanation of man's origin, or of the relation which he may be supposed to have held to pre-existing or lower forms of animal life (a question into which Mr. Dawkins abstains from entering), no reasonable doubt can be entertained as to the fact of man's having roamed the forests of Britain while tenanted still by the rhinoceros, elephant, urus, and bison; while the hippopotamus haunted the banks of the Thames, as well as the beaver and the otter. There were wolves also, bears, brown and grisly, wild cats, and lions of vast size, with hyænas which prowled in packs by night to prey upon the young, the wounded, and the weak. Of the Arctic mammals there remained still in Britain the reindeer, the musk sheep, and the marmot.

Two successive races of men are shown by the researches of archæologists to be distinguishable throughout Europe during the long series of ages represented by the Pleistocene period—namely, the river drift men and the cave men, the former and ruder race no doubt surviving in Britain long after it had given place further eastwards in Europe to a wave of advancing culture. Their common seat or source is, in equal probability, to be sought in the central plateau of Asia, whence these Palæolithic tribes swarmed off by successive migrations, reaching in course of time as far as Britain. Here the rude primæval hunter—whose flint arrow-points are found deep down in the gravel drift of rivers widely differing in their course and level from the streams of our day—brought down the reindeer and other Arctic animals which had been driven south by the glacial climate now passing away. A great change had passed over the aspect of the country by the time when the cave man followed, with his polished implements and generally less rude culture. Though they had not yet found their way to constructing the rude dwellings of earth or wood which mark a further step in civilization, the rudiments of art are nevertheless displayed by these savages of the cave in their graphic etchings of the mammoth, the reindeer, the bear, and man himself, upon fragments of bone. We have not many specimens of this artistic kind from British caves to pit against the expressive outlines of animals and men from the French and Swiss deposits with which our author has embellished his pages; but for symmetry of shape and finish of workmanship we may compare favourably with any foreign implements of the sort such examples of chipped flints as he has given us in the large spear-head found so long ago as 1690 in Gray's Inn Lane, in company with the remains of an elephant. There is unsurpassed force also in the profile of a horse etched upon a fragment of bone from the upper cave earth of the Robin Hood Cave (Fig. 53). The only actual relic of the frame of Pleistocene man is a tooth found in the cave of Plas Newydd, in Wales. The cave-men, as our author argues, are to be regarded as far in advance of the men of the river drift, having in all probability also been altogether distinct from them in race, though he stands here in opposition to the high authority of Mr. Evans. However this may be, there is abundant proof that we have in the cave-men the near representatives in civilization, and probably in race, of the Eskimos of our day.

The whole interval between the Pleistocene age and the beginning of history is covered by what is called the Prehistoric period. At the outset of this a new race is seen encroaching from the east upon the haunts of the cave-men, bringing with them superior weapons of polished stone, some at least of the domestic animals, and many of the cultivated seeds and fruits. Within this time it seems likely that Great Britain was severed from the Continent, and the general aspect of the country became much what it is now. No attempt is made by Mr. Dawkins to estimate the number of years involved in this process. At the present rate, however, of wasting of the chalk cliffs, it may be taken that 200,000 years or so would suffice to bring about the existing width of the Dover Straits. Here Neolithic man found wild species of animals which had survived from Pleistocene times, among them the urus, in which some are inclined to see the ancestors of the Chillingham cattle of our day, and the gigantic elk of the Irish peat bogs. Other species he introduced or tamed. For his dwelling he built rude circular huts over pits or hollows in the earth, many of which are still traceable in places, as at Standlake, Brentknoll, and Fisherton, near Salisbury, and in which have been found the remains of animals used for food, spindle whorls, needles, and combs of bone, rude fragments of pottery, and celts both polished and roughly chipped. Our author inserts an engraving of a curious bog house at Drumkellin bog, Donegal. Miners' picks of stone and flint, with handles of deer's horn, attest the mode of digging up the flints of their weapons and implements, and the galleries in which they worked are traceable at

* *Early Man in Britain, and his Place in the Tertiary Period.* By W. Boyd Dawkins, M.A., F.R.S., F.G.S., F.S.A., Curator of the Manchester Museum, and Professor of Geology in Owens College, Manchester. Illustrated by Woodcuts. London: Macmillan & Co. 1880.

Brandon and elsewhere, where little cups of chalk have been met with intended to hold grease for the supply of light. At Cissbury a vast store of flints in every stage of manufacture betokens the site of a factory on a large scale. Canoes hollowed out of tree-trunks show us the Neolithic men afloat on fishing or marauding enterprises, and possibly ferrying over from the Continent or to Ireland their cattle and household stuff. Their reverence for the dead and their belief as regards the state after death may be traced in their various cromlechs. To the same stage of civilization may be referred their pile-dwellings, fresh remains of which are continually turning up in these islands and on the Continent, indicating the wide range to be assigned to the tribes of the Neolithic age. Before it had given way to the more advanced period of bronze, somewhat of the culture of the East had found its way thus far; glass beads, probably introduced if not made by the Phœnicians, being met with in Neolithic tombs and pile-dwellings. Doubtless, during this phase of savage life in the remote West, Egypt and Assyria were highly organized empires, and civilization was far advanced among the Mediterranean races.

In what relation did the Neolithic inhabitants of Britain stand to the people of the Continent, or to races still living? This is the crucial problem for the Palæontologist, and it forms the most prominent portion of Mr. Dawkins's book. Acknowledging its difficulty, he is confident of solving it by the aid of the joint results of osteological inquiry with those of ethnology, history, and geography. The researches of Thurman and Davis, Wilson, Busk, and Huxley tend to show that these men were of the short, long-headed type widely spread over the Continent, perpetuated in the Basques, who in blood and speech represent the Iberian, non-Aryan stock which once ranged from Spain to Germany and Denmark on the north-east, and southwards beyond the Pillars of Hercules, being gradually pressed westwards by the Aryan Celtic races who brought in the use of bronze. The dawn of history finds these races confronting each other in Spain and Gaul, or commingled in the great Celt-Iberi of Castile. The Iberic wave—of which the existing traces are distinctively seen in the fragmentary relics thrown up in the Basque-speaking people of Spain and Brittany—swept widely over Europe, and, if not wholly displacing, mingled with the life current of many a race that had preceded it in its westward flow from its source in mid-Asia. The Iberic population in the British Isles was preserved, Mr. Dawkins thinks probable, from contact with other races during the whole of the Neolithic period, while on the Continent rival tribes, like the Belgæ and others of Teutonic stock, pressed upon the Neolithic people. A chart is given to show the probable distribution of Iberic, Celtic, and Belgic races at the incoming of the age of history. By the time of Strabo the retrocession of the Iberic race had been made good from the Rhone to the Pyrenees. A second chart, compiled by M. Broca from the army returns, gives evidence in the existing physical characters of the French people that elements of this early variety in blood are still at work in the population. The differences of stature indicated by the number of exemptions from military service correspond most closely with those of complexion and general physique. The shortest people are those of the "départements noirs," the swarthy natives of the old province of Aquitania (Aquitani, Auski, Eusques, Vascones, Basques) once more largely diffused, and still traceable not in Brittany alone, but in wide districts of central France. The "départements blancs" on the Belgic frontier are made up of the tall fair-haired people of Belgic, Celtic, or Teutonic stock; the "départements gris," south of the Garonne, marking the settlements of the fair-haired Visigoths, Franks, and English of intermediate stature, with brown hair and grey or brown eyes. The important position held in Europe in prehistoric times by the Iberic tribes of non-Aryan blood is insisted on by our author on grounds common to the ethnologist and the historian, and affords in his opinion a clue through many a labyrinth of ethnical affinities:—

> Before the Celtic invasion Gaul was inhabited by other tribes than the Iberian. The Ligures dwelt in the district round Marseilles, and held the region between the river Po and the Gulf of Genoa to the western boundary of Etruria, and they extended along the coast of the Mediterranean as far as the Pyrenees, that is to say, over the area included under the name of Iberia in its more ancient sense. They have also left marks of their presence in the name of the Loire (Ligur), and possibly in Britain in the obscure term Lloegrians (Lloegr). From the intimate manner in which they are associated with the Iberians by classical writers, coupled with their agreement in small stature and swarthy complexion, it may be inferred with tolerable certainty that they were related to each other, as the Frank to the Goth, or the Dane to the Norman, and that they belong to the same non-Aryan branch of the human race. It is also by no means improbable that the small swarthy Etruskans, whose empire extended in the earliest times recorded by history north of the Alps into Tyrol, and who held dominion also over Lombardy, belong to the same non-Aryan stock, since they were conterminous, and were driven away from their ancient possessions by the same invading peoples. Just as the Celt poured down through central France, isolating the Ligurian and the Iberian, so he poured through the passes of the Alps into Lombardy, sundering the Etruskans of Rhætia and Noricum from those of Etruria proper. In my belief the Iberians of France and Spain, the Silures of Wales, the Ligures of southern Gaul and northern Italy, and the small dark Etruskans, are to be looked upon as ethnological islands isolated by successive invasions, pointing out that if we could go deep enough in past time we should find that the whole of Europe was inhabited solely by a swarthy non-Aryan population.

The evidence for the survival in the existing population of Britain of a Basque or Iberian element was put forward by Mr. Dawkins some years back in an able paper in the *Fortnightly Review*. Commenting upon these proofs at the time (*Saturday Review*, September 12, 1874), and allowing to the full their coherence and cogency from a physiological as well as an historical point of view, we remarked upon the absence of such confirmatory evidence as the study of language may ordinarily be expected to bring to any ethnological problem of this kind. If a Basque dialect was spoken in these islands down to the time of the Celtic invasion, how is it that no trace of Basque is to be met with in the Welsh tongue of to-day, or even in the nomenclature of any district of Wales or Britain? The speech of the Basques has survived, together with their blood, the intrusive violence before which they have retreated to their present isolated strongholds on the sea-coasts of France and Spain, whilst here they must be supposed to have wholly exchanged their Iberian speech for that of their Celtic conquerors. We are glad to find our author devoting a section of his present book to the evidence of language, although he does little more than set aside the appeal to language as the test of race. He is able here to fortify himself by more than one high authority, to the extent at least of the general proposition. Language is not so much the test of race as of social contact and influence. Savage and barbarous tongues are specially liable to flux and change, and what form the Iberian speech held in Neolithic times we have not the slightest means of making out. The Basque of to-day is too modern for us to imagine what were the forms of its words a thousand years ago, and the failure of Humboldt should suffice to show us the uselessness of seeking for traces of Basque words in local names, whether in Wales, France, or elsewhere. It is notwithstanding strange that the dissolving action of time, as Dr. Broca happily calls it, should so utterly have obliterated the non-Aryan tongue supposed to have been formerly spoken by the Neolithic aborigines of Britain, whilst it has left such indubitable traces in the Basque dialects of our day. The very evidence adduced by our author of Neolithic survival among the Pyrenees makes more emphatic the silence of this side of the channel. The researches of the Abbé Inchauspé, made known in 1875, point to the Basque names for cutting tools, viz., *aizcora* axe, *aitzurra* pick, *aiztoa* knife, *aizturrac* scissors, as unexpected relics of the speech of the Neolithic age. In these words used by the Basques both of France and Spain—the third, however, only in the valley of Roncal in Spanish Navarre—*aitz* (*aitza* or *atcha*), a stone, is compounded with *gora*, high, lifted up = stone mounted in a handle; *urra*, to tear asunder = a stone to tear in sunder the earth; *itoa*, a diminutive = little stone; and *aizturrac* = *aiztto* and *urra*—the final *c* marking the plural; the whole standing for "little stones for tearing asunder." These derivations, we are assured, are accepted by Prince Lucien Bonaparte. If we may discern in this flake of prehistoric speech a Neolithic source for our own adze or axe, our surprise at such a proof of continuity between ourselves and a remote Iberian ancestry is mixed with wonder that further signs of linguistic survival should not be forthcoming. Here, assuredly, is the weakest link in Mr. Dawkins's chain of proof. The arguments on which he rests his case—the similarity of type in skulls and other marks of physique, in modes of burial, in signs of general culture, belief, and superstition—go notwithstanding far towards establishing the broader conclusions with which he sums up this portion of his work:—

> At the beginning of the Prehistoric period the small, dark, non-Aryan farmers and herdsmen passed into Europe from Central Asia, bringing with them the Neolithic civilisation, which took deep root. The section of them which spread over Gaul, Spain, and the British Isles, is only known to us as the Iberic aborigines. Outside these limits we meet with traces of the Iberic peoples in Sicily, Sardinia, and in Northern Africa. They have also left their mark in Asia Minor in the name Iberia (= Georgia), in the same manner as the Gauls have left their name in Galatia, or modern Anatolia, south of the Aladag mountains. After a lapse of time sufficient to allow the non-Aryan Neolithic civilisation to penetrate into every part of the Continent, the Celtic Aryans poured in, and made themselves masters of a large part of Gaul and Spain in the Neolithic age. It may be inferred from the geographical position of Germany, as well as from the distribution of the human skulls, and the evidence of history, that it also was held by these two races of men. The Iberic peoples were probably driven from the regions east of the Rhine by the Celts, and they in their turn by the Belgæ, just as within the Historic period the Belgæ were pushed farther to the west by the Germans, who in their turn were compelled to leave their ancient homes to be occupied by Sclaves. Thus we have evidence of two distinct races in Neolithic Europe, the older, or non-Aryan, and the newer, or the Aryan. There is no reason to believe that the Iberic tribes derived their culture from, or were related in blood to, their predecessors the Cave-men. The progress of civilisation in Europe has been continuous from the Neolithic age down to the present time, and in that remote age the history of the nations of the west finds its proper starting-point.

With the same patience in research and skill in marshalling his facts, our author proceeds to trace the incoming of the Bronze Age with the wave of Celtic immigration, from the same primæval fountain of humanity in the central uplands of Asia. The Iberic peoples of the British Isles were long kept intact from this invasion, and not only Egypt and Assyria, but the Greek races of the Mediterranean basin were beyond doubt highly advanced in their civilization whilst our island forefathers lingered in the rude stone age. Gradually the culture and the arts of the Eastern more developed peoples found their way to these shores. The maritime enterprise of Phœnicia extended hitherwards both the natural and artificial produce of the East. Pottery and bronzes of Greek pattern and design are met with side by side with the rude implements of native handiwork, and Etruscan art is represented by the beautifully wrought repoussé corslet of gold, found in a burial cairn near Mold, North Wales, in 1832, (figs. 159, 160). The trade routes whereby vessels, weapons, and ornaments of

Etruscan manufacture, found their way to the northern coasts, from which the amber in demand amongst the artists of the south was in turn conveyed to the Mediterranean markets, as well as the line of traffic from Olbia, at the mouth of the Dnieper, to the Baltic, and that of the Greeks from Massilia to the north-west point of the Spanish peninsula, are laid down upon the map of Europe. The evidences of this gradual spread of enterprise within historical times are built up from a careful survey of the classical authorities, leading on to the exploration of the British coasts from the time when the invasion of Cæsar brought these islands within the pale of European civilisation. Our author's exhaustive inquiry finds Britain part of a continent not yet tenanted by man. The vast changes he has had to trace have left in their passage a thread of continuity which enables him to show the Tertiary period with which it opens extending without a break, so as to include our own times. Where it is dropped by geology, archæology, and ethnology, history takes up the tale of human progress, and leaves it in the hands of science with the hope of a boundless future.

A JAPANESE ROMANCE.*

SINCE 1868 the modern Japanese seem to have made it their ambition to become the Belgians of the East. Like that people, they are thrifty, industrious, good-humoured, and eminently unromantic. What their character was before the revolution, before the mania for imitating European manners, we can nowhere learn so well as from *The Loyal League*, a Japanese romance translated by Mr. Dickins. The events upon which this novel is founded, and to which it adheres with tolerable fidelity, occurred in the beginning of the eighteenth century. The league of forty-six men who, at the certain cost of their own lives, avenged the death of their lord, is a matter of modern history. The spirit of the author of the romance, the spirit which placed all duty in loyalty and in revenge, was universal in Japan till late in the present century. But the Japanese novelist, for political reasons, was compelled to throw back the incidents of his story into the fourteenth century, and to alter the names of his characters. It is as if Scott had not only given false names to the historical persons in the *Bride of Lammermoor*, but had placed the period of that romance in the fourteenth century. It is necessary, then, to bear in mind that the story of *The Loyal League* is only partially true in incident, while it is as true as the author could make it in descriptions of national manners and sentiments. Unfortunately, the translator has occasionally found it necessary to omit, and even to alter, passages "where judged advisable to meet the exigencies of English readers." This naturally deprives the work of some of its value as a picture of manners. As a mere novel, it can be recommended to all readers who have the energy to struggle with the initial difficulties of style. These difficulties lie chiefly in the Japanese author's love of complex and elaborate puns which are incapable of being rendered into English. The translator has done his best with these witticisms, which require explanatory notes. After the reader becomes accustomed to the manner of the narrative, the matter wins his attention.

We do not intend to follow very closely the plot of *The Loyal League*. There are two sets of characters, of which one is much less interesting than the other. The fortunes of the friends of Wakasanosuke may be allowed to drop out of the story, while we follow the adventures of the forty-six *Ronin*, or "broken men," who avenged the death of Yenya. In 1338, according to the story-teller, a certain Lord Moronaho was in high office at Kamakura. Among his retainers were two Samurahi, or nobles, who themselves had feudatories under them. These men were named Wakasanosuke and Yenya. The former offended his haughty lord by his conduct at a public ceremony. The latter had the misfortune to have a fair and virtuous wife, the lady Kawoyo. It chanced that Moronaho made insulting proposals to Kawoyo in the hearing of Wakasanosuke, who rescued the lady. This irritated Moronaho, who reviled Wakasanosuke. Here a singular feature in the old feudal character declared itself. Wakasanosuke made up his mind to slay Moronaho, to whom he seems to have felt no duty of loyalty. The slaying was prevented by a device of one of Wakasanosuke's men, who privily bribed Moronaho. The proud lord therefore threw both his swords down before Wakasanosuke, and apologized to him with abject humility. This happened very early in the morning, before daylight, at a great feast. To the same feast came Yenya, eager to avenge the insult to his wife. Yenya was accompanied by Kampei, one of his retainers, and it was Kampei's duty to share all the fortunes and adventures of his lord. But Kampei was young; he met Karu, the girl of his heart, in the dusk, and wandered away with her into a grove of pine-trees. During his absence Yenya met and was insulted by Moronaho. He aimed a sword-blow at his superior, wounded, and would have slain him, had not an officious peacemaker interfered. Soldiers came up, Yenya was seized, and sent to await his sentence in his own castle. Kampei, who came up too late to aid his lord, was in despair. "How can I ever wear two swords again before the eyes of men!" he cried, and but for the prayers of Karu, his betrothed, he would have made the happy despatch. But Karu persuaded him to go to the house of her father, [illegible], a farmer, where we shall soon follow his fortunes. Yenya's sentence was not long deferred. Two royal commissioners came to his castle with the tidings that he must do *seppuku*—that is, despatch himself in the usual way. The description of this scene is very remarkable. In spite of the separatist tendencies of clan life and clan loyalty, the command of the central authority was instantly and peacefully obeyed. If one of the early Stuarts had sent two officers to bid the chief of the Macdonalds or Macleods destroy himself, the conduct of the Highland clansmen would have been very different. They would have boiled the royal emissaries, or starved them to death, or thrown them into the loch. Contrast with this the behaviour of Yenya and his clansmen, in the Japanese romance:—

> Meanwhile a confused sound of knocking in the partition resounded from the adjoining apartment, and the voices of a number of clansmen were heard clamouring for permission to look once more upon their lord's face while in life, and begging Goyemon to obtain that favour for them. Goyemon, accordingly, asked the condemned nobleman to allow the retainers to enter.
>
> "What is this?" cried Yenya. "Yet their request is proper enough! But they must wait until Yuranosuke returns."
>
> Goyemon bowed assent, and addressing himself to the clansmen, exclaimed: "You have heard our lord's will. You cannot enter yet; not one of you."
>
> They did not utter a word in reply, and complete silence reigned in the apartment in which they still remained assembled. Rikiya, meanwhile, at a sign from Yenya, had placed the sword with which the self-dispatch was to be accomplished, and which had been previously got ready, before his lord, who, after composedly throwing back the shoulder-folds of the *kamishimo*, arranged himself in a suitable position.
>
> "And now, Sirs," said Yenya, addressing the Commissioners; "I call upon you to be witnesses to my obedience."
>
> He drew a three-cornered stand towards himself as he spoke, and taking up the short sword that lay upon it, lifted it respectfully to his forehead.
>
> "Rikiya, Rikiya."
>
> "My lord."
>
> "Yuranosuke."
>
> "He is not yet returned, your lordship."
>
> "Alas! and yet I wished so greatly to see him once more in life. There is so much to be arranged -but now——"
>
> As he uttered the last words the unfortunate nobleman grasped the sword, point downwards, in his bow-hand, and with one movement ripped himself open.

When Yenya had expired, one of his retainers, Yuranosuke, seized the short sword with which the deed was done, and vowed revenge. The clan of Yenya were to be driven from his lands, were to be *ronin*, or broken men; but they might still punish the enemy of their lord. Two clansmen, Kudaiu and his son Sadakuro, held themselves aloof from this determination. The rest scattered to various refuges in the hills.

The story now returns to Kampei, the young retainer whom love had lured from his duty to his lord. Kampei was living at his father-in-law's house as a hunter, "tracking the monkey and the wild boar along the narrow mountain paths—narrow as were his means of existence." This is a pleasing example of the old Japanese taste and style. On the mountains he met one of the revengeful *ronin*, and implored to be allowed to aid in the vengeance which should be taken on Moronaho. But the *ronin* told him that he could be allowed to do no more than subscribe towards the expenses of Yenya's monument. This was a thing quite out of Kampei's power. He had no money, no means of buying back such favour as would restore him to his rank as a gentleman, and help him to revenge the death of his lord. To aid him, his wife and father-in-law had come to a desperate resolution. For five years the girl had bound herself to be a "tea-house girl"—that is, to abandon virtue. Kampei may not have been aware of the plan, but it was one from which, as we learn, no man would have shrunk, if by his wife's prostitution he might accomplish his revenge. There could scarcely be a more amazing instance of the moral pre-eminence of the idea of loyal vengeance. But Kampei did not survive to punish Moronaho. As his old father returned from the town with the price of his daughter's honour, he was slain and robbed by a highwayman. In firing at a wild boar, Kampei shot the thief and took the money. On returning to his house he found the people of the "tea-house" leading away his bride. His possession of the money became known, the body of his father-in-law was found, he was accused of the murder, and in despair committed the usual suicide. His bride was carried to the tea-house where Yuranosuke, the chief of the avengers, was disarming suspicion by leading a dissipated life. Here she was found by her own brother, who proposed that she should let him slay her, for the following reasons:—

> "Better to die by my hand than by that of some other man; and if I slay you, and tell our chief that, though you were my sister, I could not pardon you, as knowing what ought not to be entrusted to a woman, he will let me add my name to the list of conspirators, and I shall share with him the glory of the enterprise."
>
> "What makes the meanness of my condition so intolerable is, that unless I show the world that there is in me what makes me superior to the mass of men, I cannot hope to be allowed to take part in our chief's undertaking. You understand me, sister; give me your li[illegible], let yourself die at my hands."

The poor girl answers, "O, what have I to live for! But I must not die by your hands, brother, or our mother will be angry with you. Let me end my life myself. You can still take my head, or my whole body if you like, and show one or the other in proof of your devoted loyalty." But the unhappy Karu was rescued by the chief of the avengers, who shortly afterwards had the pleasure of hacking a disloyal clansman to pieces with a rusty

* *The Loyal League: a Japanese Romance.* Translated by F. V. Dickins. London: Allen & Co. 1880.

sword. From this point the tale is complicated by the actions of the friends of Wakasanosuke, and by a love-story of some interest, but of still greater complexity. At last we arrive at the Retribution. Yuranosuke and his men storm the castle of Moronaho, and cut off the head of the hated foe of their lord. Their revenge is described with a kind of delirious delight. "Fortunate are we as though we gazed upon the flower that blooms but once in three thousand years." The ritual of atonement to the dead Yenya was thus solemnly performed:—

Yuranosuke, drawing from his bosom the tablets inscribed with the posthumous name of his dead master, placed it reverently on a small stand at the upper end of the room, and then set the head of Moronaho, cleansed from blood, on another opposite to it. He next took a perfume from within his helmet, and burnt it before the tablet of his lord, prostrating himself and withdrawing slowly, while he bowed his head reverently three times, and then again thrice three times.

"O thou soul of my liege lord, with awe doth thy vassal approach thy mighty presence, who art now like unto him that was born of the lotus-flower to attain a glory and eminence beyond the understanding of men! Before the sacred tablet tremblingly set I the head of thine enemy, severed from his corpse by the sword thou deignedst to bestow upon thy servant in the hour of thy last agony. O thou that art now resting amid the shadows of the tall grass, look with favour on my offering." Bursting into tears, the *Karō* of Yenya thus adored the memory of his lord.

The novel ends with a massacre, but not—in this translation, at least—with an account of the suicide of the clansmen. The historical version of the affair will be found in Mr. Dickins's admirable appendix, which contains many interesting notes on Japanese folk-lore, customs, and religion. The narrative, though not quite so easy to read as novels which deal with modern English manners, has a curious vigour, healthiness, and freshness. The excellent tinted woodcuts are the work of Japanese artists.

ITALY IN THE EIGHTEENTH CENTURY.*

CRESCIMBENI'S history of the Arcadian Academy at Rome, in the original Italian, was printed in London in 1804, edited by Mathias, the well-known author of the *Pursuits of Literature*. It is a choice little volume from Bulmer's press; and gives an account also of the affiliated academical Societies with their appropriate badges, all bearing in common the pipe of seven reeds, bound with laurel, which was the ensign of the parent club. Each member was to assume a pastoral name and a local Greek appellation; Mathias, who was himself elected a member of the Academy, bore the Arcadian name of Lariso Salaminio; and Goethe, who received the honour of membership in 1788, was known as Megalio Melpomenio. Both of them would be surprised to find their famous Academy, which indeed still exists, so much forgotten as to be treated in the volume before us like a disinterred mummy of past days, of whose history every one is presumed to be ignorant. In fact, a lady now living and well known in society is a shepherdess of Arcadia. The late Lady William Russell was elected an Arcadian, as the "valorosa ed erudita Signora la nobil Donna Elisabetta Anna Rawdon." Her name was "Selene," and a deed of gift accompanied her diploma, conveying to the new member certain vacant pastures in Cythera, from which she was to take her second name of "Citerin." This document is dated 4th December 1815, but in the diploma the date is reckoned by Olympiads. The story of the birth and life of the Arcadian Academy is a curious one, and may be read with interest in the first of the essays now collected in the volume before us for publication. It is told in a somewhat confused and breathless style, but it is both amusing and instructive. After some trouble it appears that the writer discovered the neglected and forsaken meeting-place of the once famous Academy on the road winding up the Janiculum towards the Villa Pamphili. But the former glories of the Bosco Parrasio have fled. The villa was occupied by peasants; the gardens and bowers have gone to ruin and decay. Yet the pictures remain; Algarotti, Alfieri, and Metastasio continue to look down on the scene of their departed greatness; and the portrait of John V. of Portugal surveys what was his gift to the Society of which he was an unworthy member.

In 1688 that strange personage, Queen Christina of Sweden, went to reside in Rome, surrounded herself with a sort of literary Court, and became an established patroness of letters, extending her support to a number of men of more or less distinction, and she could boast of Filicaja as being one among them. The Arcadian Academy was the offspring of the society thus brought together, but was not actually founded until after the death of the ex-Queen. One morning in 1692 a party of fourteen belonging to this *coterie* happened to meet in the Prati di Castello, behind the Castle of Sant' Angelo, and were inspired by their surroundings to revive the memories of the ancient Arcadia. The best known among them were Gravina, a jurist of reputation, and the person who adopted and brought forward the young Trapassi, whose name was afterwards Grecized into Metastasio; and Crescimbeni, to whom justice is not done when he is called simply "the stupidest and most self-important of Roman pedants." Naturally the party became shepherds on the spot; they arranged a list of pastoral names and Grecian birthplaces, for which they immediately drew lots; and the head of the Society was called the *Custode* or guardian of the flock.

It was the period of Academies, and the new one became the rage. *Bergerie*, which was destined to be somewhat later the subject of Watteau's art, was the fashion, and every one rushed to join the pastoral poets and men of learning. Italy was full of an idle but not always ignorant nobility, who, together with the equally unemployed ecclesiastics and quasi-ecclesiastics, eagerly sought every occasion of pretending to literary importance. Crescimbeni was elected the first *Custode Generale d'Arcadia*, and reigned under the academic title of Alphesibeo Cario. Gravina's legal talents were called into play to legislate for the recently-formed State, and he composed in choice Latin a sagacious code of laws. The members had indeed a serious purpose in view, which was no less than the reformation of literature in Italy, and its restoration to excellence and purity. They deserve some credit for this, although their performances fall very far short of their pretensions, and may have occasionally presented a semi-ludicrous aspect. Transactions and literary contributions were printed and published under the direction of the *Custode Generale*; and subordinated Arcadian societies sprang up in every city and town. In the colony at Bologna were to be found the painter Carlo Maratti and his daughter Faustina, wife of the poet Felice Zappi; names which suggest how much the whole movement belonged to an age of feebleness and decadence, rather than to one of vigorous youth and real advance.

But the pleasant pastures of Arcadia did not secure entire harmony among the piping shepherds. There was a furious dispute between Gravina and Crescimbeni on the authorship of the code, and for a time a schism divided the fold. Peace, however, was restored; Gravina died, and Arcadia continued to flourish at unity with itself. Its poets were nevertheless still conspicuous for their mediocrity. Later on, one of the shepherds was Rolli, who translated *Paradise Lost*, who enjoyed some reputation in Italy, and who is mentioned not discreditably in the *Dunciad*, where a note gives the information that he wrote many operas, which, partly by the help of his genius, prevailed in England for twenty years, and that he taught Italian to some fine gentlemen who affected to direct the opera. He was flattered with the name of the modern Propertius, because he was a native of Umbria; and carried his intended imitation of the antique so far as to make him think it prudent to announce solemnly that he was in truth a faithful member of the Holy Catholic Church. Frugoni was another of the mediocrities who figured among the Arcadians. Like a much more eminent man, his name became the foundation of a word employed to designate the style in which he indulged; and *Frugonaria* may be classed with *Marivaudage*, as a phrase coined to meet a particular want. But Marivaux was the founder of the modern novel of social life, and Frugoni was only a second or third-rate poet of Arcadia. Metastasio, from the popularity he so long enjoyed in Europe, and for his own real merits, deserves a very different kind of mention. His words for operas occupied a position never attained by any other similar compositions. In fact, instead of their being prepared to fit the music, successive composers wrote music for his words, so that the same *libretto* formed the basis for a number of different settings to music. He had poetical genius of an order short indeed of the highest, but such as well entitled him to the regard in which he was for so long a time held.

It was in 1725 that Bernardino Perfetti, the greatest of the *improvvisatori*, received the honours of coronation in the Capitol. Seven Arcadians, as we are told, headed by Crescimbeni, repeated laudatory poems, accompanied by trumpets and drums and the salute of a hundred mortars. Two or three years after this event the first *Custode* of Arcadia died, after having held his great office for thirty-eight years. He had belonged to the academy of the *Disposti* at fifteen, and was also a member of the *Infecondi*, although this did not prevent him from being a prolific writer. In addition to all his other services to the Society, he published a book of the lives of deceased Arcadians, and was so much perplexed by the difficulty of selecting the names of the members to be thus immortalized that he solved it by drawing lots.

A sketch given of the state of society in Italy at this period is clever and readable. The constant effort to procure amusement, with some aim at literary interest, was likely to encourage a great deal of indifferent poetry; but it also gave birth to the opera, and to the modern Italian comedy, of which Goldoni was the principal creator. Questions in time arose whether the Arcadian Academy had rendered any real service to literature, whether its members were better and more virtuous than other people, and whether a renewal of the pastoral life was consistent with civilization. Baretti, so well known in England as one of the group surrounding Dr. Johnson, and as the compiler of the English-Italian dictionary bearing his name, was the constant scourge of the pretensions of the Academy. His *Frusta Letteraria*, started in 1763, was clumsily framed in imitation of the *Spectator*, with a counterpart Sir Roger de Coverley and other characters upon whom to hang his opinions; and its lash was chiefly directed against the Arcadians—that is to say, against almost all contemporary Italians who took any part in literature. Nevertheless Arcadia survived these and other attacks, and in 1775 it was connected with another coronation in the Capitol, which, in its turn, suggested to a distinguished French authoress the most remarkable incident in her famous novel. There was a certain Maria Maddalena Morelli from Pistoia, of queerish reputation, known as poet and improviser, and much in request for her powers of social entertainment. She was Corilla Olimpica among the Arcadians, and according to the manners of

* *Studies of the Eighteenth Century in Italy.* By Vernon Lee. London: Satchell & Co. 1880.

the period was honoured with public invitations to Vienna, Venice, and Bologna. The Pope, Clement XIV., gave her permission to read books prohibited by the Inquisition; and she was courted by all the celebrities of Rome—Orloff, the Corsican Paoli, and the English Duke of Dorset. Her receptions were brilliant; she was a musician as well as a poet, could play the violin, and patronized the young Mozart. Altogether she became a personage almost adored by many people, while denounced as a pretentious and disreputable adventuress by others. Finally came the laurelled honours of the Capitol, when the poor lady was exposed to a very bad quarter of an hour. Something unpleasant had been expected, and the ceremony was in consequence appointed to take place at midnight; nevertheless a young priest pushed through the bystanders and put a paper in the hand of Corilla; finding it was in Latin, she handed it to Prince Gonzaga, who, supposing it to contain complimentary verses, read them out, when they proved to be infamously insulting. Next day the storm of disapprobation broke out, the absurd coronation was denounced as illegal, and its heroine or victim had reason to wish it had never taken place. Years afterwards Mme. de Staël wrote *Corinne*, and dignified this incident of Roman folly and scandal in the way well known to readers of that remarkable work.

And so Italy went on in affected idling and sonneteering and playing at being what she was not, until towards the end of the century, when there came upon Europe that great change, the end of which we do not yet see, usually described by the expression of the French Revolution; after which a new order of things superseded the former frivolities and imbecilities. The only achievements of the century known in England as the eighteenth, but in Italy as the seventeenth, were, as has been already mentioned, the establishment of the opera and of the modern Italian comedy; and, while this was going on, the great, glorious, and abiding names of its literature had been forgotten and neglected. How all this happened, together with much detail on musical and dramatic matters, may be pleasantly learned from other parts of "Vernon Lee's" volume. We have only to enter a protest against the use of such a word as "æsthetician," by which the writer is self-described; and to remark that we are not surprised that one who delights in such a name should consider the satire of Hogarth to consist in "coarse and insipid alternations of ugly vacuity and ugly grimace."

A RIDE IN PETTICOATS AND SLIPPERS.*

RECOLLECTIONS of a book with a somewhat similar title made us associate the *Ride in Petticoats and Slippers* with the interior of the Flowery Land. In reality Captain Colvile made his expedition to a country which till very recently was scarcely more familiar to Europeans than China, and whose inhabitants were considered as hostile to foreigners as the Chinese. It is true that in the course of the present generation Morocco has been repeatedly visited by travellers, and we have had several admirably descriptive volumes on the subject by authors of no slight literary skill. One of these, by the Italian Signor de Amicis, we took an opportunity of noticing lately in terms of high praise. But Signor de Amicis merely described a track that has been frequently travelled of late years by embassies from the European Powers who sought the Sultan in his capital. Captain Colvile, after making his way to Fez, following the circuitous route by the coast from Tangiers, struck out a bolder and more original line, and explored some extent of new territory. His book, though of infinitely less pretensions than the portly and handsomely illustrated volume of the Italian journalist, is almost as brightly and picturesquely written. We are not by any means prepared to agree with him when he decides that it is next to impossible to be at once instructive and amusing, and accordingly relegates his solid information to an appendix. The works of some previous travellers in Morocco seem to us to furnish irresistible evidence to the contrary. Be that as it may, however, we do Captain Colvile but bare justice when we say that we have found him an entertaining guide and companion. He has a light touch and a lively style; he dashes in the salient features of the country and its inhabitants in a succession of chapters which are necessarily sketchy, since he made a flying journey in a short holiday. He looks on men and things by preference either in their humorous or their picturesque aspects; and the odd mingling of the comic with the grave, the sublime, and even the horrible, is perpetually striking the traveller in Morocco. *Apropos* of the strange fashions of those fanatical Moslems, we must remark that Captain Colvile is somewhat too fond of making slight but suggestive allusions that are often indecorous and would have been far better omitted. We have read Sterne, and tried in vain to smile over what Thackeray calls his "dreary *double-entendres*"; and we suspect that nothing comes more easily in the shape of "wit" than printing certain obvious reflections that most people keep to themselves. But, as we are grateful on the whole to Captain Colvile for amusing us, we shall finish our fault-finding with one other observation, which he has partly answered by anticipation in his preface. It is much to his credit that before starting on his trip he took regular lessons in the Moorish language; and we only wish that other tourists who have the intention of publishing would go into training in a similarly conscientious spirit. But a little learning may be a dangerous thing in more ways than one; and we doubt whether Captain Colvile was wisely advised when he "thought it better, at the risk of giving some of the words a rather barbarous look, to spell them phonetically, according to the vulgar pronunciation of the country." Were we to write a guide-book, or some notes of travel in our Lake country, we should scarcely think of setting down the names of the lakes and mountains after the pronunciation of the dalesmen of Cumberland and Westmoreland. And so in Captain Colvile's Morocco our most familiar acquaintances are to be detected with difficulty under novel disguises. In the way of titles, "Cidy" sounds odd in place of the generally-received "Sidi"; but it is in the designations of places that we are most widely abroad. "Mekenes," for instance, is a pretty close translation of Mequinez; but it was some time before we got a glimmering of the fact that "Marakish" was a free rendering of "Morocco." Nor even now do we feel absolutely sure that we may not have been betrayed into a misconception.

It makes a novel feature in Captain Colvile's wanderings that he persuaded his wife to accompany him. It might have been thought that the presence of a lady must have been a grave embarrassment. And so it undoubtedly might have proved in many cases; but Mrs. Colvile, like Lady Anne Blunt, Lady Baker, and some others of her sex, seems to have been born to enjoy adventurous travel. From the moment of her landing in Africa, as her husband tells us, she took kindly to handling firearms, and carried a revolver, with a pair of "Deringers." Till she began to be familiarized with the strange incidents of night bivouacs under canvas in the wilderness, she was always ready to mount guard over her husband and their property at a moment's notice. In reality, the chance of an onslaught by robbers, which was probable enough in much of the country they travelled through, must have been sufficiently trying to the nerves of a lady. But her husband found that her companionship was actually of service to him. And, considering the contemptuous manner in which the Moors treat their own "womankind," the courtesy with which they behaved to Mrs. Colvile was remarkable. The dignitaries everywhere dressed their faces in smiles when they came into her presence; and even the rude camp-followers consulted her comfort obsequiously, and invariably addressed her in the most respectful language.

Of course the staple of Captain Colvile's little book consists very much of the ordinary incidents and sights of Moorish travel, with which we have been more or less familiarized. But he always gives them a certain freshness by his pleasant manner of relating; and in his remarks on the Sultan's army in particular—which, by the way, has changed greatly for the better in the course of the last year or two—his professional knowledge comes in usefully. He gives an amusing account of the scenes at the ferries, which likewise strongly impressed Signor de Amicis. Thus the coast road from Tangiers to the southward is constantly frequented; on the rivers "some twenty boat-loads of animals (some of them valuable horses) are taken across daily throughout the year." But the passive forces of Oriental conservatism have opposed themselves to all ideas of reform; and the arrangements are still stupidly difficult and dangerous. "The unfortunate beasts were simply walked up to the boat, and then expected to jump over the high bulwarks at a stand, and that out of some eighteen inches of soft mud and water. A good English hunter would think twice before performing such a feat. As for the beasts of the country, they are first urged to attempt the impossible, with the invariable result of their positively refusing." Then the attendants lay violent hands on them, lift them on to their hind legs by main force, transport the fore feet into the boat, and next compel the hind quarters to follow. Talking of the travelling arrangements of his native followers, Captain Colvile's curious observations led him to some singular discoveries. He found that the pedestrians not only carried their whole attire on their persons, but that their wardrobes sometimes included a very remarkable variety of garments. One of his men, who had nothing in the way of luggage, habitually wore a whole succession of casings in different materials bearing Moorish names which we need not transcribe. Another, some time towards the middle of the journey, suddenly sported a sailor's tarpaulin jacket, and Captain Colvile, surprised and puzzled by the apparition, could only surmise that the man had been wearing it next the skin. If we take severe exercise and the warmth of the climate into account, the practice seems all the more unaccountable; though we know that under the pressure of necessity one may go far in Morocco without any change of raiment, for even Gerard Rholfs, with the habits of a European, managed very tolerably after a treacherous travelling companion had literally relieved him of his bundle. We can hardly select a better sample of Captain Colvile's style than his picture of the traffic in a street of Fez:—

> Walking down the main thoroughfare, what a wondrous crowd one meets! First knocked nearly off our legs by a passing camel, then picked up on the other side by a blow from a donkey's pannier, one fights his way along; here jammed into a corner with a hideous old hag, who hastily covers her face lest the infidel should behold her charms; then carried forward with the crowd, who are eager to kiss the garment of the great man who is ambling by on his mule; at one moment side by side with a respectable merchant, the next jostling with a grinning idiot, stark naked, a mass of vermin, sores and filth, who is quite as likely as not to tear one to pieces with his teeth, while the crowd looks on and approves. Side by side with the dirty, barefooted Jews, obsequious and cringing, strange, half-savage creatures from the mountains, good-humoured-looking negro slaves, and beggars maimed, halt, and blind, scarcely less repulsive in appearance than the idiot saints

* *A Ride in Petticoats and Slippers.* By Captain H. E. Colvile, Grenadier Guards. London: Sampson Low & Co. 1880.

The six thousand regular troops on the war establishment of the Sultan have been drilled by an English officer in the service into a state of efficiency that reflects great credit on their commander. They must be very different from the undisciplined rabble that provoked the contemptuous strictures of Rholfs. Though still wearing all manner of nondescript uniforms, they went through the ordinary manœuvres as well as many English regiments. But the weapons continue to be as inferior as they are promiscuous; and the Moorish army have still "no engineers, transport, or commissariat, and not a single doctor." Their English commander said that he knew that they could not face any European troops in the open; but then, as he remarked, they would never be rash enough to do so, but would fall back on irregular attacks, and lay themselves out to act upon the communications. The journey from Fez to Oudjda, on the frontier of Algiers, lay for great part of the way through a country unexplored by Europeans; and the narrative of it is well worth reading on that account, though it offered few very novel incidents. The Colviles travelled, of course, with letters of recommendation from the Sultan, and the local dignitaries were invariably courteous. The only exception was in the case of a certain Kaid Aly. His stiff civility was evidently constrained; and Captain Colvile was the more surprised when he reappeared later in the evening with a manner of extreme cordiality. It appeared that he had mistaken his English guest for a Frenchman; and, especially in the neighbourhood of French Algeria, the Moors are haunted by the fear of sharing the fate of the Algerine Arabs. Indeed Captain Colvile devotes an "excursus" in his appendix to arguing that both France and Spain turn covetous eyes towards Morocco; and he hints that a French officer in the Sultan's pay at Fez is there in reality for purposes of espionage. And he had as his fellow-traveller in the Tlemcen and Oran *diligence* another French officer, who, as he believes, had been specially told off for the duty of pumping them. He adds, with justifiable satisfaction, that, if it were so, the Frenchman had a rough journey for his pains, which is more than can be said for Captain and Mrs. Colvile, who must have had what the Americans call "a good time."

LEGGE'S RELIGIONS OF CHINA.*

THE question whether Confucianism is a religion or not is among the sects of the Protestant missionaries in China of the present day, very much what the permissibility or the reverse of ancestral worship was among the Dominicans and Jesuits in the time of Ricci. The two armies of disputants are equally positive, and both point triumphantly to the collected evidence on either side. While one party quotes the references to the Supreme Being to be found in the earlier classical works edited by Confucius, and some modern prayers which have found their way into the national worship, the other makes capital out of the absence of anything like religion to be met with in the sayings of the sage himself. As in most contentions, both sides in this matter of dispute are to a certain extent right, and both are to a certain extent wrong. Those who, like Dr. Legge, lay greater stress on the pre-Confucian Confucianism, and the modern development of the cult, than on the teachings of Confucius, are no doubt justified in calling Confucianism a religion; while those who take their idea of Confucianism from the "Four Books," hold with equal truth that it is merely an ethical system, and not a religion. Practically, therefore, the dispute resolves itself into the question of a name; and if the Chinese denomination of *Ju chiao*, or Scholars' Religion, were used instead of the European term of Confucianism, there would be very little left in dispute.

The work before us furnishes an apt illustration of the treatment Confucianism receives at the hands of the religionists of whom Dr. Legge is the chief. In the two lectures devoted to the subject there is a great deal about the views of Yâo and Shun on the worship of T'ien and Shang Ti, and much also on modern prayer addressed to Shang Ti at solstitial services, but comparatively little about the sayings of Confucius, or the system formulated by his disciples from his teachings. There can be no doubt that the ancient Chinese worshipped a god they called Shang Ti, to whom belonged many of the attributes of Jehovah and of the god Hea of the Babylonians. He was, as Dr. Legge says,

> the ruler of men and all this lower world. Men in general, the mass of the people, were his peculiar care. He appointed grain to be the chief nourishment of all. He watched especially over the conduct of kings whom he had exalted to their high position for the good of the people. While they reverenced Him and fulfilled their duties in His fear, and with reference to His will, taking His ways as their pattern, He maintained them, smelt the sweet savour of their offerings, and blessed them and their people with abundance and general prosperity. When they became impious and negligent of their duties, He punished them, took away the throne from them, and appointed others in their place. His appointments came from His foreknowledge and foreordination.

But Shang Ti was not their only object of worship. Shun, we are told (2255—2205 B.C.) "sacrificed . . . . with the ordinary forms to Shang Ti, and sacrificed purely to the six objects of Honour." Who these six deities were we are not told, and Chinese commentators have exercised much ingenuity in attempting to identify them with members of the Chinese Pantheon. But recent investigations point to a common origin of the civilizations of China and Babylonia, and in the early history of the last-named Empire we find, next in rank to the supreme God, six deities of the first order. There appears to be every probability that, as we advance in our knowledge of the history and dialects of ancient Babylonia, we shall be able to explain many points which have hitherto been obscure or unintelligible in the history and language of China. Even the Yih King of which Dr. Legge speaks promises to yield up its secrets by a comparison with the Akkadian syllabaries in the British Museum; and there can be no doubt that much light will eventually be thrown on early "Confucianism" from the same sources of information. But no later knowledge will alter the fact that the ancient Chinese believed in and worshipped a supreme God, and the main charge advanced against Confucius is that he ignored His existence. Only once he mentioned His name, except in quotation; and on the few occasions on which he spoke of a supreme power he preferred to use the abstract word T'ien, or Heaven. He was a plain matter-of-fact man, and concerned himself rather with the relations between man and man than between man and God. This is not the view of Dr. Legge, who considers that while "his avoiding the name Ti seems to betray a coldness of temperament and intellect in the matter of religion," "we need not shrink from allowing that he was a messenger from God to his countrymen for good, for it never was the way of God to reveal all truth at once by His chosen instruments, or to make them by their calling infallible, so that they should not err in judgment or stumble in practice."

We should be more inclined to agree with this dictum if there had not previously existed a fuller religious knowledge than Confucius possessed, or at least owned to. In the early chapters of the *Shooking* we meet with constant references to the active interference of God in the affairs of the Empire, and with full acknowledgments of the dependence of the sovereign upon God. But there is barely an utterance of Confucius which gives countenance to the belief that in this he agreed with the heroes of antiquity whose memory he held so dear. It is true that the worship of Shang Ti has at all times assumed rather the character of a State worship than of a personal religion. He was more the god of the soil, taking cognizance only of the acts of the people as a nation, than the father of each individual subject, listening to his prayers, rewarding his efforts after holiness, and punishing his deflections from the path of duty. It is possible that, as Dr. Legge suggests, Confucius, knowing this, "felt himself fettered, and did not care to use his personal name." But, if this be so, is Confucianism a religion? Confucius himself, we are told, "avoided speaking on four subjects; extraordinary things; feats of strength; rebellious disorder; and spirits." And when asked by a disciple about death, he replied, "While you do not know about life, how can you know about death?" "Respect the spirits, but keep aloof from them," is another piece of advice which showed the non-religious tendency of his mind. In marked contrast with the purely secular teachings of the sage are the prayers quoted by Dr. Legge which were offered to Shang Ti in the year 1538 by the Emperor Kia Tsing, of the Ming Dynasty, and by the first Emperor of the present ruling house. On both occasions the individuality of Shang Ti was plainly acknowledged and his blessing was sought for by the Imperial suppliant.

> On the first day of the coming month [prayed Kia Tsing] we shall reverently lead our officers and people to honour the great name of Shang Ti, dwelling in his sovereign heavens, looking up to the nine-storied azure vault. Beforehand we inform you, all ye celestial and all ye terrestrial spirits, and will trouble you on our behalf, to exert your spiritual power, and display your vigorous efficacy, communicating our poor desire to Shang Ti, and praying him graciously to grant us His acceptance and regard, and to be pleased with the title which we shall reverently present.

The whole sum of the matter then amounts to this:—If by Confucianism is understood the teachings of Confucius, there is scarcely a trace of religion to be found in it; but, if the theistic worship which was established by the early sovereigns of China, and which has been continued in almost unbroken succession to the present day, be considered as the expression of Confucianism, then it may be regarded as a religious cult.

In treating of Tâouism as a religion Dr. Legge has in the same way been careful to distinguish between the teachings of the author of the philosophy and the superstitious aspects they have since assumed. Laou-tsze, the founder of Tâouism, was a contemporary of Confucius. His origin and history are surrounded by mystery. Unlike Confucius, whose family records, daily life, sayings, and habits, are all familiar to us, Laou-tsze's parentage is unknown, and beyond the fact that at one time he held the post of historiographer at the court of Chow, we know scarcely anything about him. We may believe that there was such a man, and that he was the author of the philosophical work entitled *Taou tih king* which is attributed to him. But the association of this work with his name only renders him a still more mysterious personage. The whole conception of the book is foreign to the Chinese mode of thought, and savours strongly of Indian philosophy. It may fairly be assumed that India or some of the Indianized States of Central Asia were known to the Chinese before the time of Laou-tsze, and it is quite conceivable that he might either have studied philosophy beyond the frontier of China, or have sat at the feet of some one who had. But, as Dr. Legge says, there is not a word in the *Taou tih king* that refers directly either to superstition or religion. It contains only the ideas of the author on the relations existing between the universe and something which he calls *Taou*. Of this *Taou* Laou-tsze said that

* *The Religions of China: Confucianism and Tâoism, Described and Compared with Christianity.* By James Legge. London: Hodder & Stoughton. 1880.

it was nameless, and certainly the very diverse attempts of translators to find an equivalent for it in European languages lead one to wish that they had accepted the author's view of it. It has been variously rendered by "Reason," "the Word," "the Path," and the "Way"! This last, in the sense of *μέθοδος*, most nearly represents its true meaning.

The text of the *Taou tih king* is extremely obscure, and is rendered untrustworthy by the modifications introduced into it when the ancient characters—the koo wăn—in which it was originally written were reproduced in their modern shape. This, combined with the foreign and abstruse train of thought embodied in it, has encouraged theorists to build the most extravagant fancies on its contents. Even in the generation immediately succeeding that of Laou-tsze we find his celebrated follower Lieh-tszo perverting his dicta on the identity of existence and non-existence into a warrant for the old doctrine, "Let us eat and drink, for to-morrow we die." "Why trouble oneself," he asks, "about anything in life? Is not death, which is but a return from existence to non-existence, ever close at hand? My body is not my own; I am merely an inhabitant of it for the time being, and shall resign it when I return to the 'Abyss Mother.' Why, then, should I weary myself in the pursuit of politics, or of the many anxieties with which some men delight to perplex themselves? Rather let me 'take the goods the gods provide' and enjoy to-day, leaving to-morrow to take care of itself." From such a state of mind the transition is easy to the many and gross superstitions which have clustered round the teachings of the "Old Philosopher." For an account of various phases through which Tâouism has passed we must refer our readers to Dr. Legge's third lecture, where these are clearly and ably set forth.

In his concluding lecture Dr. Legge compares Confucianism and Tâouism with Christianity, and, as might be expected, draws a conclusion incomparably in favour of Christianity. At the same time he gives full credit to the Chinese faiths for the good they possess, and he treats of them in a way which must deprive their followers of any right to complain that he fails to sympathize with their aspirations.

GOLDWIN SMITH'S COWPER.*

THE only answer to the objection commonly brought against such biographical summaries as Mr. John Morley's popular *English Men of Letters* is that, while the material brought forward in them is confessedly not new, it is yet treated critically and in so novel a fashion by the masters of language who adopt it that it receives a fresh and lasting value at their hands. This is the very essence of criticism, regarded as one of the fine arts, that it should change old lamps for new by its magic touch, and give our life-long favourites fresh characteristics in our eyes. So illuminated, the sketch of some well-known man of letters, whose life and works are familiar to all the world, may yet afford genuine intellectual pleasure, and be thoroughly worthy of publication. But this freshness of critical touch is absolutely essential; without it the essay is ephemeral and trite, and its publication is a vexation to sensible readers. Now, without passing so sweeping a judgment as this upon Mr. Goldwin Smith's little book on Cowper, we are bound to say that we have discovered in it nothing of that peculiar attitude of mind which should accompany the writing of such a sketch. It appears that Mr. Goldwin Smith has regarded the simplicity of Cowper's character, the homely russet qualities of his verse, and the monotony of his career, as elements which greatly enhanced the ease of his undertaking, and here, we think, has been his cardinal error. It needs no great delicacy of insight or lightness of touch to describe with force the hair-breadth escapes and frantic adventures of a hero of melodrama. His terrific leaps, his crafty disguises, his feats with bow and gun have a charm in themselves which leads the reader breathless from one clumsy paragraph to another. So, in a less degree, but a moderate amount of literary skill is needful to describe the life of an Alfieri or an Alfred de Musset, where all is at fever-heat, and the paroxysms of emotion succeed one another with startling rapidity. But to interest the reader in the life of a shy recluse, whose delicate mind was tinted with melancholy religious madness, whose loudest expression of passion and thought never rose above the key of a maidenly propriety, to give us the exact flavour and perfume of this unostentatious flower of literature—this requires consummate art and skill. Mr. Goldwin Smith has not done this; he has scarcely attempted to do it; we may go further still, and say that he has apparently not perceived any necessity for doing it.

The inadequacy of the present memoir is the more emphatic from the comparative excellence of Mr. Benham's prefatory memoir to the Globe Edition of Cowper's Poems. We do not know that Mr. Benham has proved himself to have any special literary gift, or that on any other occasion he would show himself an excellent biographer. We only know that in this special and peculiar instance he has shown the exact combination of religious sympathy and intellectual indulgence which makes him the most tender and admirable biographer that Cowper could desire. Mr. Goldwin Smith mentions, as he could hardly fail to do, his acknowledgments to this previous memoir, but he has not found a word of praise for his predecessor. We cannot wonder at his reticence in recommending Mr. Benham's essay, for, having carefully compared them throughout, we find not one page in the later biography which is an improvement on the earlier; and indeed, to all who possess the Globe Edition of Cowper, this new Life by Mr. Goldwin Smith is a mere encumbrance.

Even in so simple a life as that of Cowper, however, Mr. Goldwin Smith has not been able faithfully to follow his authorities. He must have read the poet's fragment of an autobiography, if at all, very hastily and imperfectly, and we are not sure that he has even looked at Hayley's Life. He seems to have founded his sketch upon the main storehouse of information, Southey's Life and Letters of the poet. This was well, but this was not enough, for Southey had no personal acquaintance with Cowper, and the testimony of eye-witnesses should never be entirely disregarded. One instance of misstatement of fact will serve as a type of others. Mr. Goldwin Smith gives a rhetorical account of Cowper's behaviour in the matter of the appointment to the House of Lords, and he has painted the poor poet in a light so contemptible that it is quite distressing to read the passage. Of course the episode is one of the saddest and most humiliating on record, but by omitting one little essential point Mr. Goldwin Smith has given the maniacal helplessness of Cowper a touch of positive imbecility. He says that the catastrophe was brought on by an incident with which religion had nothing to do, and represents Cowper as breaking down under the personal fear of standing up to be examined before the House of Peers. To commit suicide as the only escape from a devouring shyness, with no other burden on the mind, would show a condition of sensibility quite monstrous and incredible. As a matter of fact, this agony of shyness came on in consequence of a more serious terror, and when Mr. Goldwin Smith says that religion had nothing to do with the crisis, he makes a singular mistake. The facts are these:—Cowper had to wait till the post was made vacant by the death of the existing holder, and, as he was feeling painfully the pressure of his poverty, he waited with an ardour and an impatience which filled him with remorse when the clerk did at last die. To his overstrung conscience it seemed that he had committed murder; he had longed and prayed for the death of a man, and the stain of homicide was on his soul. This was religious mania, but it was aroused by an intelligible scruple, and when he had allowed himself to be nominated, and found his nomination contested, he at once saw the hand of God in this arrest, prepared to crush him for his crime. So his terrible fear of appearing before the House of Lords was not due to the contemptible social shyness to which Mr. Goldwin Smith attributes it, but to a pious madness which saw in that assembly the tribunal divinely appointed to expose the poor soul's guilty desires. In such a condition of mind as this suicide seemed only too simple a form of release. It is true that Cowper was ignorant at this time of any definite system of religious dogma, but not the less was he the victim of theological terrors, all the more horrible because entirely vague and shapeless.

The critical portion of this volume, as far as it regards the poetry of Cowper, strikes us as dull and poor. On the very first occasion possible, on the introduction of the "Olney Hymns," Mr. Goldwin Smith shows himself one of the worst of critics. We quote this remarkable passage, which appears to us to be founded on a wholly erroneous theory of poetry:—

> Cowper's "Olney Hymns" have not any serious value as poetry. Hymns rarely have. The relations of man with Deity transcend and repel poetical treatment. There is nothing in them on which the creative imagination can be exercised. Hymns can be little more than incense of the worshipping soul. Those of the Latin Church are the best; not because they are better poetry than the rest (for they are not), but because their language is the most sonorous.

We have been accustomed to regard the best Latin hymns as owing their excellence to the sonorous language in which they are written; but we suppose Mr. Goldwin Smith considers language no essential part of poetry. As regards the reason why hymns rarely are poetry, we are very far from allowing that it is because their subject repels poetical treatment. It is rather because few persons who possess the fire and stress which characterize the lyrical temperament are inspired with that personal religious simplicity which the composition of a good hymn demands. But when these rare and very dissimilar qualities are combined in a single nature, we find plenty of matter in religious poetry upon which the creative imagination can be exercised. In our own language, and in the century of Cowper, Wesley produced not a few hymns in which the utmost sincerity of religious experience was combined with sublimity of lyrical expression; among later writers it is scarcely necessary to mention the names of Heber, Keble, and Miss Christina Rossetti. It so happens that Cowper's hymns are not merely not good as poetry, but that they are unusually bad. "God moves in a mysterious way" is almost unique among English hymns for glaring faults of style, for false ornament, confused imagery, and unconscious indecency of appeal to the Deity. It is very remarkable that so delicate a writer, the finest poet of his age, should have fallen, in those devotional pieces where he most ardently desired to succeed, into depths below the worst failures of such writers as Toplady and Erskine. The source of the failure probably is to be sought in a kind of involuntary insincerity; Cowper eagerly longed to be devout, but there seems little reason to think that he experienced any of that instinctive rapture and pious afflatus which bore up such robuster souls as Newton and Whitefield; and, though reflective poetry may flourish under such half-hearted conditions, lyrical poetry scarcely can.

* *Cowper.* By Goldwin Smith. London: Macmillan & Co.

We are not pleased with the author's treatment of the volume of 1782. We were obliged, by the by, to refer to another authority to refresh our memories as to the date of this important book, for Mr. Goldwin Smith is apparently an implacable enemy to dates. He gives us a grave dissertation on the three species of satire which he supposes to exist; and he quotes, with approval, an amazingly dull contemporary notice of the *Moral Satires*, in which Cowper is represented as "not possessed of any superior abilities or the power of genius requisite for so arduous an undertaking as inculcating the precepts of morality"; but he does not attempt to show what relation these essays in didactic verse bore to previous productions in the same line, or to hint that in this book Cowper summed up the attainment of a particular school before founding a new one. He does not attempt to ascertain in what degree Cowper is to be regarded as bringing to perfection one aspect of the tendency of Pope—namely, the neat and nervous expression of moral emotion and moral intelligence; or what his attitude was with regard to Darwin, in whom the purely rhetorical side of Pope's genius found a somewhat ridiculous apotheosis. Cowper received his inspiration through Churchill, as Darwin through Johnson, and each lost something of the sincere fervour of his immediate predecessor. All this, however, is now merely of antiquarian interest to us. Cowper himself was destined to destroy the school of Pope, and in his own *Task*, no less than in the narratives of Crabbe, a new and realistic manner came into vogue, and expelled the old rhetoric for ever.

Mr. Goldwin Smith, who calls Andromache "a savage woman," whose "fierce wail is really semi-physical, and scarcely capable of exact translation," and who imagines that "poetry can never be the direct expression of emotion," has fairly put himself out of court as a poetical critic. But he has shown here and there in the present volume touches of biographical faculty which show him to be not incapable of good work if he will only take trouble. Otherwise the present example of his workmanship calls for but little remark. It is weakly and carelessly constructed, and is scarcely calculated to enhance the reputation either of the biographer or his subject.

THE COMPLETE WORKS OF BRET HARTE.*

THE edition of Mr. Bret Harte's works, collected and revised by himself, of which the first volume has lately been issued, is prefaced by an introduction in which the author sets forth his reasons for desiring the appearance of a new and authentic edition. Without any such reasons as he gives, the collection would still have been welcome; but the account which he gives of his literary career, and of the fictitious incidents which have been invented and have passed current concerning it, has a special interest. "The opportunity here offered," Mr. Bret Harte writes, "to give some account of the genesis of these Californian sketches, and the conditions under which they were conceived, is peculiarly tempting to an author who has been obliged to retain a decent professional reticence under a cloud of ingenious surmise, theory, and misinterpretation." He goes on to say that it might have seemed hardly necessary to point out to an intelligent English audience that the idea of the Californian stories, and the fact of their obtaining a wide hearing, were due to the success of the well-known "Heathen Chinee"; but that nevertheless within the past year he "has had the satisfaction of reading this ingenious theory, in a literary review of no mean eminence." As a matter of fact, it was between 1862 and 1866 that he produced "his first efforts toward indicating a peculiarly characteristic Western American literature"—one of which was the very dramatic and pathetic "Story of Mliss." This fact he quotes as evidence of what he calls his early, half-boyish, and very enthusiastic belief in the possibility of such a literature, a belief which impelled him a few years later to write "The Heathen Chinee" and *The Luck of Roaring Camp*. It has not infrequently happened in the history of literature that work of striking merit has at first made but little impression on the very people to whom it might be expected especially to appeal. This was the case with Mr. Bret Harte's earlier work. The Californians delighted in Eastern magazines, and current Eastern literature, and in English publications, and it was easier, the author says, to get a copy of *Punch* at "Red Dog" or "One-Horse Gulch" than he has since found it in an English provincial town. "An audience," he modestly writes, "thus liberally equipped and familiar with the best modern writers was naturally critical and exacting, and no one appreciates more than he does the salutary effects of this severe discipline upon his earlier efforts." The history of *The Luck of Roaring Camp*, the opening tale of the volume by which Mr. Bret Harte was first known to English readers as a prose writer of unusual power, is curious. He wrote it when he was editing the *Overland Mail* to supply the want which he perceived of any distinctive Californian romance in its pages. "He had not yet received the proof-sheets when he was suddenly summoned to the office of the publisher, whom he found standing the picture of dismay and anxiety with the proof before him." It then appeared that the printer had taken the surprising step of sending the proof to the publisher, and not to its author, who was also editor of the paper, because "the matter thereof was so indecent, irreligious, and improper" that the proof-reader, a young lady, had all but refused to read it through, and he, the printer, had felt bound to warn his friend the publisher against the line which the new editor was taking. The matter was referred to common friends, who, however, came to no clear decision, and finally the publisher, to his great credit, preferred his editor's judgment and skill to the scruples of the printer's and proof-reader's offended propriety. The local press received the story with doubt and dismay, but a wider audience recognized its freshness and power, and the author almost immediately received requests for similar tales from more important American periodicals than the *Overland Mail*. The "Luck" was followed by other sketches, now well known to all Mr. Bret Harte's readers, of the strange wild life in the midst of which he found himself when "a mere truant schoolboy." The truth of these sketches has been repeatedly questioned, and the author in the introduction, of which we have given an account, says that "in only a single instance was he conscious of drawing purely from his imagination and fancy for a character and a logical succession of incidents drawn therefrom." It is pleasant to know that our belief in Yuba Bill, John Oakhurst, and the rest has not been misplaced.

The first volume of the new edition contains only one specimen of the author's work which is new to us, a drama called *Two Men of Sandy Bar*, the plot of which is an expansion and alteration of one of the author's short stories. It turns upon an exploit of our old friend Mr. John Oakhurst, who finds it convenient to pass himself off for a certain period as the prodigal son of Alexander Morton, a respectable and wealthy banker, who has led a drunken life in his youth and has turned his son out of doors. The dialogue of the play is written, for the most part, in the author's best manner, and there are several striking situations. One of these is found at the end of the first act, when old Morton has claimed Oakhurst as his missing son. Oakhurst accepts the situation to further his ends, and at Morton's command is going to let himself out of Don José's house, into which he has introduced himself in order to elope with Doña Jorita, when the voice of a man known as Diego is heard outside singing

> O yer's your Sandy Morton;
> Drink him down!
> O yer's your Sandy Morton,
> For he's drunk and goin' a courtin',
> O yer's your Sandy Morton;
> Drink him down!

The necessity of accounting for old Morton's not hearing the voice which strikes Oakhurst with such amazement appears to have escaped the author, whose stage directions at other points are, if anything, needlessly minute. Granting that this difficulty is overcome, the situation is decidedly good. More novel, perhaps, is the management of a duel, not in itself particularly relevant to the plot, between Concho, a Mexican rascal, and our old friend Colonel Starbottle. The scene is led up to by Concho's attempt to expose the trick practised by Oakhurst to Don José, an attempt which is defeated by the fact that Oakhurst has just given up his place to its rightful owner. Thus, when Concho demands to be brought face to face with the person whom he has denounced as an impostor and swindler, he is confronted, to his horror, with the real Sandy Morton. A good touch in the course of the scene is Sandy's dropping, when he gets excited, from the formal business manner which he at first assumes into the speech and ways of the mining camp. When Don José and Sandy have left the stage, Concho, foiled and infuriated, is about to follow them, when Starbottle stops him, and challenges him to a duel in which they draw at hazard for two pistols, one of which is loaded, the other unloaded. When they have drawn and are waiting for the stroke of the clock at which they are to pull triggers, Starbottle says:—

> One moment, a single moment——
>
> *Concho.* Ah, a trick! Coward! you cannot destroy my aim.
>
> *Starbottle.* I overlook the—er—epithet. I wished only to ask, if you should be—er—unfortunate, if there was anything I could say to your—er—friends.
>
> *Concho.* You cannot make the fool of me, coward. No!
>
> *Starbottle.* My object was only precautionary. Owing to the position in which you—er—persist in holding your weapon, in a line with my right eye, I perceive that a ray of light enters the nipple, and—er—illuminates the barrel. I judge from this, that you have been unfortunate enough to draw the—er—er—unloaded pistol.
>
> *Concho* [*tremulously lowering weapon*]. Eh! Ah! This is murder! [*Drops pistol.*] Murder!—eh—help! [*retreating*], help! [*Exit hurriedly door C., as clock strikes.* COL. STARBOTTLE *lowers his pistol, and moves with great pomposity to the other side of the table, taking up pistol.*]
>
> *Starbottle* [*examining pistol*]. Ah! [*Lifts it, and discharges it.*] It seems that I am mistaken. [*Going.*] The pistol was—er—loaded!
>
> [*Exit.*

Regarded as an acting piece the play has, as might be expected, many technical faults, and contains what seems to us one serious artistic blunder. This is the drunken scene at the end, which is unpleasant, improbable, and ill-written. Old Morton is about to be told of the imposition which has been practised on him, and of the fact that the man whom he knows as Diego is really his son. He comes in helplessly drunk; and Sandy, when he offers to take another drink, cries "Stop." "Who dares countermand my orders?" asks Morton, and Concho replies, "I will, tell you. Diego—dismissed from the ranks of Don José for drunkenness!

---

* *Complete Works of Bret Harte.* Collected and Revised by the Author. Vol. I. Poems and Drama. London: Chatto & Windus. 1880.

Sandy—the vagabond of Red Gulch!" On this Sandy makes the following ultra-melodramatic speech:—

Yes, Diego—Sandy—the outcast—but, God help me! no longer the drunkard! I forbid you to touch that glass! I'm your son, Alexander Morton! Yes, look at me, father; I, with drunkenness in my blood, planted by you, fostered by you—I, whom you sought to save—I—I, stand here to save you! Go! (*to servant*) Go! While he is thus, I—*I* am master here!

This seems to us untrue to nature and as false in art, in which respects it must be said it is in striking contrast to most of the play.

The collected poems which make up the rest of the volume are, as we have said, already known to Mr. Bret Harte's readers; but it is certainly well to have them collected and supervised by the author himself, and they exhibit admirably his range and variety in verse-writing.

TWO MINOR TALES.*

Very Genteel might well be included in a series of volumes which is brought out, as an advertisement facing its title-page shows us, by the same publishers. It eminently deserves to be reckoned among *Stories for Daughters at Home*. It is a tract in one volume. The lesson that the author teaches us might easily be taught in half a dozen pages stitched together. It is true that her book runs to more than three hundred pages; but then she has thought it wise not only to expound, but to enliven, her moral. She writes to amuse and interest, as well as to instruct, her young readers. Considering, then, that her volume is really a tract in disguise, that the moral, instead of being judiciously given at the end, so that the reader may skip it if he choose, is carefully spread over the whole book—considering this, we say, the story is not so dull as might have been looked for. On the contrary, there are, we feel sure, families so serious that they will almost doubt whether it is not in parts too amusing to be lawfully read. Certainly they will have it put away on Saturday evening with the toys and the work-basket till Monday morning, and decide that it is too light for Sabbath reading. The moral of the tale is one that has been preached more than once; but neither in stories nor in sermons are we justified in asking for anything new. Our moral writers can indeed somewhat vary their circumstances; but they have, after all, to follow in the same beaten road, and, as others have done before, reward the virtuous, punish the vicious, and correct the faults of those who are as yet neither one nor the other. The heroine of the story before us is the giddy young wife of a respectable Irish bookseller. She is impressed with the sense of her own gentility. It had been some effort to her to accept her husband's addresses. "A bookseller's is a very nice business," he had said to her on the day when he proposed. "'It is,'" she said thoughtfully, 'it's genteel.'" They married, and the consequences were only what might have been expected. He had no buttons on his shirts, and too often not a clean shirt to wear. His dinner was generally late and badly cooked, and when he asked a friend to share it with him, all the table-cloths were either dirty or at the wash. In vain did he point out that he had bought and paid for six table-cloths. In vain did he maintain that, if there were one in use and two every week at the wash, there ought to be three in the drawer always ready for any emergency. "Emergency," by the way, is in itself so genteel a word, that surely it ought to have done something to soften his wife. But he made the great mistake of quoting the example of his mother. Things seem to be getting into a very sad way, but the reader takes hope. He is introduced to an admirable young matron, who makes her husband as comfortable as the model wife of a tract can do. His buttons are never off, a clean shirt always awaits him, and no emergency, we feel sure, ever yet found her without a clean table-cloth. She goes even beyond this. She helps her husband in keeping his accounts. There is one thing that astonishes us in a book of this kind. This virtuous tradesman is a wine merchant. He actually deals in alcoholic liquors, and his wife drinks Marsala. Neither of them, so far as we can discover, had a nose that was any redder than the average nose of the neighbourhood. They were both steady church-goers, and the wife worked for a Dorcas Club. Surely it would have been just as easy for the author to make them wholesale manufacturers of ginger-beer. Had she done so, she would have kept much closer to nature—at least to the nature that we meet with in good books.

It must not be supposed that the influence of this good woman told at once on the giddy creature whom she was to help to convert. Worse errors were to be committed than even the neglect of shirt-buttons, table-cloths, and dinners. It seemed for a time to be in vain that when she took up by chance a book in her husband's shop it always opened at a most appropriate text. It was in vain that she lighted upon lines such as the following:—

Nor for things that are unknown
Duties tangible neglect.

Her tangible duties—if such duties there be—she neglected as much as ever. She went into debt, and gave fifteen shillings and sixpence for an exceedingly showy set of cuffs and collars, when she could have had, we take the author's word for it, a really pretty and suitable set for five shillings. Three shillings and sixpence she spent the same day on a delicate little pair (her number was six-and-a-quarter) of lemon-coloured kid gloves. This was bad enough, but from bad she goes to worse. She helps a young lady to elope with an adventurer. It is true that she was deceived by him. She had been made to believe that a stern father was going to force the lady, if she did not save herself by flight, to marry a baronet of bad character and wooden legs. She supplies the young people with money, and hands over to them a cheque which her husband had just received from the stern father as a subscription to an hospital. By a wonderful mistake he had drawn it for five hundred pounds, instead of for fifty. Her husband is charged with theft, and she turns penitent. Everything comes right in the end; and, though her reformation was not, as we are told, brought about in a day, yet, when the reader takes leave of her, he feels confident that it will very rarely, if indeed ever, happen that a button will be found missing from her husband's shirt, or a clean table-cloth be found wanting on an emergency.

The reader who cares for a strong contrast would do well to pass at once from *Very Genteel* to *The Mistress of Coon Hall*. He will feel much as a man would who should walk straight out of one of Sir Wilfrid Lawson's meetings into the theatre at a fair when the company was putting forth all its strength in the most melodramatic of melodramas. There is no aping of gentility in this story. We move among people of real old families and great wealth. There is a mystery and a fate. The mystery is solved, and the fate is averted. For a time, however, the gloom of the story is so heightened that we scarcely ventured to hope that at the end there would be more characters left alive than would suffice to provide the dead with decent burial. The author relents, however, and is contented with killing off a couple of people who, though mysterious enough, were at the same time so aged that they were really not wanted. The most striking character in the whole story is a mysterious maiden aunt. Here surely the author may lay some claim to originality. Maiden aunts have, indeed, in their time played important parts; but we cannot call to our minds that any one of them heretofore was mysterious. She it is who is the last of the Wybeers, and gives the story its second title. So important is the part she plays that, had we been asked to name the book, we should without hesitation have called it *The Mistress of Coon Hall; or, the Mysterious Maiden Aunt*. She is always followed by a black cat, and this black cat's black kitten haunts either the hero or the heroine. It constantly turns up suddenly at a great distance from its home, and is a sign of something—though of what we fail to discover. Why there is no broomstick for the old lady to ride on, it is difficult to see. A writer ought surely to give us both black cat and broomstick or neither. When the mysterious maiden aunt dies, the secret of her cat is partly explained. It was, as she states in a letter she had written the day before her death, a descendant of a cat that had been given by the first Berriton who had married a Wybeer to the family of his bride. She, the last of the Wybeers, gave it to the heroine, who was the last of the Berritons, in token of peace and goodwill. "Isabella took the cat and the paper with tearful eyes." This old lady had a nephew, Captain Thesiger. She sends for him to her house. He arrives, and discovers on the wall of her parlour a portrait of a lady who had a face "that might be admired in a chieftainess of banditti." His aunt comes in, and he makes some joke about the picture.

"You may jeer if you like, Maximilian, but you cannot help yourself," said his aunt. "We are on the eve of a great crisis. Great wrong was done by those who preceded us, and by an inviolable law of nature the hour of retribution, though long delayed, has come at last. The guilty are in their graves, but those who share their blood share their crime. Justice must be done; it will either be for great weal or great woe. The actors are carried forward by a blind, irresistible force; they cannot escape their destiny."

She then arranges her silk handkerchief so as entirely to conceal her face, and traces their family history from the time of the Great Rebellion. We read of dark stories, the curse of blood, a grandfather's malediction, infatuated members of the family, family jewels, and woe, woe. Even the Captain, taking advantage of the fact that she paused with a convulsive shudder, began to allow that there did seem some fatality about his race. But she raised her finger to command silence, and resumed. She tells him that there is still living one member of the race originally injured, and until she can find out who or what he is, and make the wrong right, the spirit of a lady who was injured about the same time that the ancestor of the black cat was given to the family of the Wybeers will never have rest, but will ever be wandering hither and thither. The Captain on leaving his aunt's house walks along the parade, and sees a ghost. Nevertheless, he is not convinced. He visits the house of an old friend, where he finds two orphan heiresses and the black kitten. The kitten does all that a kitten can do to assist the warnings of the mysterious aunt; but it seems only too likely that the Captain will fall in love, not with Isabella Berriton, but with Alice Montague. In fact, Isabella was scarcely a girl to love at first sight. She had a very deep knowledge of geography, and she made every one—the Captain included—most stately curtseys. For a long time there was what the author calls "the strange contradic-

* *Very Genteel*. By the Author of "Mrs. Jerningham's Journal." London: Griffith & Farran. 1880.

The Mistress of Coon Hall; or, the Last of the Wybeers. A Tale. By Margaret M. Cartmell, Author of "The Viking." London: Walter Smith. 1880.

tiousness of fate." However, the reader who is fond of mysteries is thoroughly satisfied, for he gets more and more puzzled the further he advances in the tale. The difficulty is not cleared up when Isabella, following the example of the mysterious maiden aunt, gives an account of her ancestors, beginning no further back than with her great-great-great-grandfather. This gentleman had, as was generally the case in those days, an only daughter. The only daughter naturally had an aged nurse, who, on the very morning of the marriage, when "the bride was attiring for the important ceremony," exclaimed, on hearing that some jewels were suddenly tarnished, "Forbear! it is an evil omen. Alas! that mine eyes should see this day." Unfortunately no one did forbear, and the important ceremony was gone through. A few pages further on there is a third person who tells his tale. When he was on his death-bed he sent for the heroine. "The day wanes," he said to her, "and there are horrors to be told that will freeze both our hearts." He only goes two generations back. He describes a scene in the history of the Berritons, when "Rose Berriton lay delirious watched by her sister; the tutor was a prisoner in his room, guarded by Geoffrey; and the two heads of the household were locked into their respective chambers." We failed to make out—for our patience here deserted us—what was the matter. We were satisfied by finding two pages later on a figure with wide, streaming hair, between heaven and earth, that, pointing its long, bony finger at the squire, uttered an unearthly shriek.

Towards the end of the tale Isabella learns from the mysterious aunt who were her real parents. The sudden news produced upon her what the author calls a stunned sensation. Before she had recovered from it she found that the aunt had vanished, not even leaving a kitten behind her, and that she herself was locked in the room. Alice Montague at the same time was told that her mother's name was Alice Berriton. She uttered a faint scream of dismay. It seemed that she and the Captain were the grandchildren of a twin brother and sister; and therefore, by some law known to the mysterious maiden aunt, could not wed. There was nothing left for the Captain but to fall in love with the heroine, which he does with all despatch. Thereupon the mysterious maiden aunt dies, and leaves her black cat to the heroine; while all the young people of the story marry. Our readers, we have little doubt, will agree with us in thinking that, though a wife's neglect of her husband's shirt-buttons does not form the best of foundations for a tale, yet it affords materials for a more interesting plot than all the black cats, black kittens, and mysterious maiden aunts in the world.

AMERICAN LITERATURE.

THOSE who contend that myths require a long period and a rich soil of ignorance and superstition for their growth would do well to compare carefully the current American belief and the representations of popular American historics respecting the War of Independence with the actual facts of the struggle as they may be ascertained from contemporary records. There is probably not one American in ten who realizes the fact that Bunker's Hill was not only not an American victory, but a combat of which no European soldiery would have been proud; that the American militia simply held their own so long as they were secure behind entrenchments, sheltered by which they could shoot down the British without danger to themselves; and that, as soon as British courage brought danger unpleasantly near, the patriots took to their heels. But there are two general truths which no one who has studied the history of the war can doubt, which have not been so studiously misrepresented by tradition, and yet upon which an almost equally profound ignorance prevails. Nearly half the people of the colonies were averse to the rupture with the mother-country; and of the willing rebels not one half—probably indeed only a few of the more far-sighted leaders—intended that the rupture should be final. These facts may in no small measure account for the lack of foresight, loyalty, and patriotism which throughout distinguished the conduct not merely of Congress, but of the States and the people in regard to the revolutionary finance. The Southerners in the late war voted and gave their wealth as freely as their lives. One-fourth of their military population perished in the field or the hospital; three-fourths of their wealth was sacrificed almost without a murmur. During the revolutionary war of the last century it was difficult for Congress by its utmost urgency to extract from the pockets of well-to-do farmers and thriving merchants a single dollar towards the expenses of the struggle. States and citizens alike systematically resisted every measure by which the Government endeavoured to provide for the needs of the army, and subsequently for the redemption of public credit. Scandalous as was the over-issue of revolutionary paper, till at last it became utterly worthless, the responsibility for that scandal does not rest with the statesmen and financiers, except in so far as they were responsible for hurrying the people into an avoidable and not very popular conflict. The States simply replied to the urgent entreaties of Congress, to the most earnest representations of the disgrace they were incurring, by dilatory pleas, excuses, and protests that each in its turn was unfairly charged; and the paper money sank first to one-fortieth, then to one-fivehundredth of its nominal value, and was finally repudiated by universal consent. The large share of the French armies in the emancipation of the colonies has, with a natural and perhaps pardonable national vanity, been depreciated and almost ignored by American writers. We fancy there are very few American readers who know how largely the patriots were indebted to the liberality of Louis XVI. for the funds which prevented their armies from disbanding for sheer lack of bread, shoes, and powder. The story of these transactions will be found told at length by Mr. Albert S. Bolles in his *Financial History of the United States from 1774 to 1789* (1), that is, from the outbreak of the revolution to the establishment of the existing Constitution; and we think that few of the writer's countrymen will be able to read it without something like a blush. Had the story been fully known, it may be doubted whether the paper issues so lavishly employed by Mr. Lincoln's Cabinet from 1861 to 1865 would have been possible. When foreign and native critics of contemporary American politics denounce the degeneracy of the people, they should at least bear in mind that, while the contemporaries of Washington made no sort of effort even to maintain the credit of their paper money, those of Lincoln and Grant honestly paid every penny of the vast debt they had incurred; that even those who urged that its burden had been enormously enhanced by jobbery, and by terms scarcely fair to the public, found comparatively few to listen to them, and were utterly unable to shake either the resolute good faith of their countrymen or the credit of their country. The United States started bankrupt alike of money and of honour in 1789; from a not less arduous struggle the United States of 1869 emerged solvent, and with a credit higher than that of any European nation except England and France.

A thoughtful and tolerably correct comparison of the practice of the English and American Constitutions is set forth by Mr. Clark Hare in a lecture delivered before the Law Academy of Philadelphia on the 30th March last (2). The writer underrates the influence of the Crown in the actual working of our Parliamentary Government, and still more underrates the great weight and value of the potential, unexercised personal authority which prevents the gross abuse for party purposes of that prerogative which the author affirms to be lodged in the hands of the Cabinet for the time being. How utterly different is the practical operation of a system under which the President is elected for four years and the Ministers are excluded from Congress, Mr. Hare does not indicate much more clearly than has been done by other writers. The special merit of his lecture lies not so much in the comparison of the two working Constitutions as in his clever and thoughtful examination of the manner in which his countrymen, intending to borrow the Parliamentary Constitution of England, only substituted an elective President for an hereditary Monarch, and, giving to the Legislature all the power over the Executive which is constitutionally vested in the House of Commons, and to the Senate some powers of that character not enjoyed by Parliament, nevertheless failed to give to Congress any of that practical control over the selection or even the conduct of the Ministry which is so completely possessed by Parliament. The main causes of the difference are probably two, neither of which could have been fully appreciated beforehand—namely, the exclusion of Ministers from the Legislature, so that they cannot be called upon for explanation or defence; and the elective character of the Chief Magistrate, which gives him an authority co-ordinate with—not, like that of our Prime Minister, derived from—that of the Legislature. In other respects the powers nominally vested in Congress include all that are enjoyed by Parliament, and some very important further prerogatives.

Mr. Burnett, by profession a lawyer, was one of the early pioneer settlers of Oregon, and the volume before us (3) relates the experiences of a long and not uneventful life in the Far West, from the days when the Territories on the Pacific Coast were, both in physical and in political condition, almost as unsettled, wild, and uncivilized as the colonies of the Atlantic coast in the days of Cooper's *Borderers*.

There is no national peculiarity more characteristic of American literature than the general shrinking from that unpopularity which writers in nearly all European countries are ready to face in any cause in which they are personally interested. Sharp censure of republican institutions, or of the national conduct in the more important crises of the history of the last hundred years, incur a kind of general disapprobation which few American authors or public men care to provoke. How many dark spots, therefore, are to be found on their historical records the Americans are hardly aware. Perhaps there is in all the annals of the States no blacker story than that of the treatment of the Indian tribes from first to last, both by the colonists, especially those of New England, and by the Federal Government; but we may count on our fingers the men with repute or position to lose who have chosen to tell the truth upon this subject, to defend the "rights of man" when claimed on behalf of the red-skin, or to point out that every crime

attributed to the savage has been outdone a hundredfold by his civilized antagonist. To the tyrant's plea of necessity, the excuse that these things must always occur where savage and civilized man are brought into contact, there is an answer, most galling to American pride and patriotism, but most conclusive. Canada affords, and has always afforded, an example of an exactly contrary treatment carried out with consistent loyalty and with remarkable success. The shameful story is told with wonderful frankness, clearness, and cogency, if at somewhat tedious length, by Mr. George Manypenny, formerly Commissioner of Indian affairs. The history of *Our Indian Wards* (4), and of national, military, and individual dealings with them, is given in these 450 pages in full detail, and is one continuous and melancholy narrative of military crimes and diplomatic treacheries, of treaties concluded only to be broken, of wanton outrages provoking just retaliation, and made the excuse for fresh inroads upon Indian rights consecrated by repeated and solemn engagements. Nor does it appear that one word of this story can fairly be considered open to challenge. We recommend the book to the attentive study of those who fancy that American democracy has a record creditable to democracy in general, and who are in the habit of drawing or implying comparisons to the disadvantage of England in her conduct towards Asiatics or Africans. Those who are already aware that the treatment of the Indians by the American people and Government has been simply as bad as it could be from first to last, and in the greatest matters as in the smallest, will do well to remain content with that general fact. The details of atrocity and treachery are very painful reading, and sensitive students may wish in vain to forget many of the incidents of which these pages are full.

Mr. Putnam's *Addresses and Miscellanies* (5) may be of interest to himself and his friends, but are hardly worth the attention of the public at large. It is perhaps natural that a gentleman who has taken some part in politics, and one not discreditable to himself, but not sufficiently distinguished to be remembered, should wish to preserve a record thereof. But Mr. Putnam's opinion on public charities, on the merits of Mr. Charles Kingsley or President Filmore, on Kossuth or John Brown, on the Missouri Compromise or the chastisement of Mr. Charles Sumner, were those of thousands of men neither more nor less distinguished than himself, and of hundreds who expressed them at the time with more force and equal moderation. It seems hardly worth while collecting the speeches of a quarter of a century in a volume so large and so closely printed as the present, unless the speaker be one whose personality is likely to impress itself upon the memory of a second generation, or unless the speeches possess a merit which we certainly cannot ascribe to the sufficiently fluent and readable, but by no means remarkable, rhetoric of Mr. James O. Putnam.

Another elaborate biographical work of somewhat greater merit, but still far too elaborate and ponderous for the general interest of the subject, owes its existence at any rate to the enthusiastic admiration of friends, and not to any personal vanity. Dr. W. A. Muhlenberg (6) was one of the most meritorious, earnest, and devoted clergymen of his day in New York. Like many other men on whom friends such as the present biographer bestow freely the title of saint, like many of those who seem to have deserved it best, Dr. Muhlenberg had a vein of humour, made the more apparent by his general earnestness and simplicity; and in the anecdotes with which this over-lengthy biography is full there is more than one really good story. Perhaps the most amusing of all is one told in sober seriousness, as an illustration, not of the preacher's humour, but of his earnestness. Going to plead with a landlord who insisted somewhat peremptorily on his rent and ejected a tenant for non-payment, and failing—as with most landlords he would have failed—to carry his point, Dr. Muhlenberg deliberately said, "Well, sir; I would rather take my chance of the Kingdom of Heaven with the poorest, meanest, dirtiest beggar in the streets of New York than with you." The landlord's sole offence was insistence on the payment of a debt undoubtedly due; but neither the Doctor nor his biographer appears to be in the least aware of the extravagance of the preacher's pretension, or of the almost universal applicability of his anathema to men of business—to all, in fact, who have a living to earn or property to keep.

The Jubilee Singers whose story is related, and whose songs—for the most part very silly, and sometimes rather offensive, nigger melodies—are given at length in the volume before us (7), are a band of emancipated slaves instructed in singing, and carried about America and Europe by an adventurous manager, who, like so many successful speculators in different branches of American enterprise, rose from the lowest ranks of white freemen. The book is, in fact, an advertisement of his speculation; but it contains a good deal of not unamusing information respecting the personal and business adventures of himself and his staff.

Mr. Wikoff's *Reminiscences of an Idler* (8), like most American works of the kind, are characterized by the usual fault of over minuteness and lengthiness. Otherwise they are readable, and were worth writing, since Mr. Wikoff's somewhat lounging and restless life has brought him into contact with men of the most diverse characters and positions, many of them men in whom, at the time of his acquaintance with them or subsequently, the world has taken interest. On their character his chapters now and then throw some novel light; while they exhibit with perfect frankness, and an almost unconscious vanity, the temperament and habits of the author himself. Had three parts of the book been left out, and the rest rewritten in a somewhat different tone and taste, it might have been among the most successful works of its order, at a time when "society journals" and other invaders of private life prove the extent and eagerness of that appetite for such gossip to which they pander.

A centenary work on the Life and Labours of Dr. Channing (9), published in the one-hundredth year after the birth of the great Unitarian preacher, is hardly worthy of the subject or of those to whom it is of course chiefly addressed. Its tone is somewhat flippant, and a want alike of selective taste and of all sense of proportion is palpable throughout—defects less likely to be tolerated by a somewhat cold, critical, and generally cultivated sect than by Methodist or Baptist enthusiasts, to whom the name of their favourite champions might not improbably recommend even a worse executed memoir than this.

Dr. Beard's essay on Sea-sickness (10) may be interesting to all who know that painful and distressing malady as one which they may at any time, and must more or less often in the course of their lives, be called upon to undergo. We pronounce no opinion on his theory as to the character and origin of sea-sickness as a distinctly nervous disorder, or on the value of the bromides recommended by him as calculated to avert, or at least greatly relieve, its miseries; but it is obvious that his treatment can only be properly applied where the voyage is a necessity, and not a frequent one.

Mr. Sidney Lanier's treatise on the Science of English Verse (11) is so technical in its language, goes so deep into the pedantry of musical science, and throws so very little light upon practical questions affecting the structure of English metre, that we hardly feel called upon to follow him in his speculations. We do not think that he will assist a single student to scan a doubtful line of Tennyson's, or prevent a single beginner from committing the usual errors of versifiers who have imperfectly mastered their instrument, if their own ear fail to tell them what is and what is not harmonious.

Mr. Janvier's book is fairly described by its title (12). It deals with the materials, the formation, the decoration, and colouring, of pottery of various kinds, in language sufficiently intelligible, with no extravagant pretensions and no provoking affectation, and at what, considering the popularity of the subject, may be pronounced a very moderate length.

Her Bright Future (13) is a somewhat ordinary romance. "Adventures at Rangeley Lakes" (14) is a boy's book of the ordinary American kind, for which many young readers have doubtless been heartily grateful. *The Princess Elizabeth* (15) is a very ordinary drama; and in Messrs. Chandler and Mulvany's Lyrics (16) we have poetry of that class which is, said, without being absolutely bad, to be tolerable to neither gods, men, nor—circulating libraries. Messrs. Jones and Co. have published a couple of Shakspearian Travesties (17, 18), which have the distinction of being, we think, the worst, most senseless, and most thoroughly vulgar we have seen. It is possible, however, that one or two London theatres may have produced parodies as detestable as these, for which we are indebted to an anonymous citizen of St. Louis.

Among the State documents which form so important a branch of American literature, we cannot refrain from directing attention to the annual account of the operations of the Life-Saving Service (19), a service whose organization and efficiency in the United States well deserve the attention of England, with a far more extensive commerce, a far less extensive and infinitely more frequented coast. The twelfth volume of the Geological Survey of the Territories, a huge quarto (20), is devoted entirely to the fresh-water Rhizopods of North America. The Report is, in fact, a library of natural history, geography, geology, and practical information.

Of scientific or technical works we have an unusually full list. The Journals of the deservedly famous Smithsonian Institution, from the 7th December, 1846, the date of the organization of the Board of Regents, to the present day (21); the 327th volume of the *Smithsonian Miscellaneous Collections* (22), and a number of papers on Biology and Zoology (23), issued by the John Hopkins University of Baltimore, are all in their several departments worthy of note. Colonel Wainwright's *Mechanics of Animal Locomotion* (24) is too technical in language and treatment to be instructive to ordinary readers; and we fear that those who best understand that part of the work in which its practical results are embodied will be least able to connect these with the technical science of the preceding portion, or to judge how far the counsels with regard to the movements and control of cavalry are borne out by the logic of animal mechanics upon which they are professedly based.

THE AFFIRMATION DEBATE.

IT may be questioned whether, in all its history, the House of Commons has found itself in a more singular position than that in which it was placed by the debate of Thursday night. A dispute had arisen as to the construction to be placed upon the rules governing the admission of members, and the course of reference to a Select Committee had been taken. Two such Committees had reported in a manner which, taken jointly, was a sufficient solution of the immediate difficulty, though the second had added to its finding an irrelevant rider. But the Government continued mute, though its own agents had notoriously been active in the production of the singular document just referred to. A private member brought forward a resolution in defiance of the finding of the two Committees, and this resolution, supported in an indirect manner by the Government, was defeated. The opinion of the House on the case having been thus sufficiently expressed, that expression was defied by the person interested, and the SPEAKER appealed in vain to the Leader of the House for assistance. That assistance was at last given him by the Leader of the Opposition, who for twenty-four hours officiated in the PREMIER's place. Finding, however, that Sir STAFFORD NORTHCOTE was disinclined to assume the odium of government without its powers or its advantages, and driven at last into a corner, Mr. GLADSTONE proposed the resolution which came before the House on Thursday. This resolution did not deal with the case by name, nor did it take any account of the findings of the two Committees, the only positive ground on which the House had to go. It did not even formally propose the rescission of the vote which had in the preceding week asserted the will of the House. But it affirmed that the very proceeding against which every authority had decided, directly or indirectly, should be authorized, and that, subject to statutory liability, this authorization should have a retrospective effect. Even here, however, the careful pains taken by the Government not to identify themselves too definitely with the cause of their supporter appeared. By this means the House was placed in a singular difficulty. It had, indeed, recovered the advantage of possessing a leader, and of having some definite policy proposed to it by that leader. But the policy proposed was beset by many difficulties. It practically stultified the results of a deliberate decision of the House arrived at after full argument. It ignored not merely the proper findings of the two Committees, but even the irregular rider appended to the second, inasmuch as what it recommended was not a mere test affirmation specially to determine the question, but a general license to all and sundry. Lastly, by the form in which it was proposed it recommended an apparent alteration in the rules of the House with a retrospective effect—a course certainly not in accordance with the spirit, though possibly with the letter, of precedents. This inconvenient proceeding was opposed by Sir STAFFORD NORTHCOTE's amendment on the broad ground of *lis judicata*, and by Mr. SULLIVAN and Mr. P. J. SMYTH on special grounds. Between the various courses so recommended the House had to decide. Mr. GLADSTONE, in announcing the decision of the Government, at which it had taken so long to arrive, and which might have been equally well arrived at two months ago, had recommended that no arguments should be indulged in beyond a recapitulation of the situation. It was hardly likely that this not altogether modest request should be observed in Parliament or out of it. But it has so far been complied with here that there has been given what is believed to be a perfectly accurate and impartial summary of the question as it stood at four o'clock on Thursday afternoon.

It is probable that, fertile as Mr. GLADSTONE is in surprises of argument, few of his hearers anticipated the line which—Mr. GORST's technical objection to the question being rediscussed at all having been disposed of—the PREMIER's contention actually took. That contention can be very briefly disposed of. It consisted of one surprising subtlety, and one still more surprising appeal *ad pavorem*. Mr. GLADSTONE has discovered that Mr. BRADLAUGH did not himself, in approaching the table, specify the statutes under which he claimed to affirm or declare his objection to the oath, and that his declaration was not a spontaneous act, but was extracted from him by a question of Sir ERSKINE MAY's. This extraordinary plea, which was later in the evening completely upset by Sir R. CROSS, was accompanied by the argument (the truth of which, in point of fact, is undeniable) that Mr. BRADLAUGH had made himself very unpleasant to the House, and, if denied admission, was likely to make himself yet more unpleasant. Besides these arguments, and a declaration of his own personal belief in the legitimacy of Mr. BRADLAUGH's claim, the PRIME MINISTER fulfilled his promise by contributing nothing fresh to the discussion of the question. It is needless to say that these arguments were not allowed to pass unchallenged. Sir STAFFORD NORTHCOTE protested against both, but especially against the argument from Mr. BRADLAUGH's ill-behaviour—as he was bound to protest. But the singular thing was that, though attacked by the one side, they practically met with no support on the other. It does not appear that any one on the Liberal side was found to approve of Mr. GLADSTONE's "police argument"—an argument which bears a striking analogy to his famous explanation of his disestablishment of the Irish Church. No one was found to excuse the inconvenience, to use no stronger word, of the House rescinding by a sham general resolution—sham, because there is no one but Mr. BRADLAUGH to take advantage of it—the decisions of two Committees and a full vote of the House. No one was found to commend the Government for putting off till the latest and most awkward moment a resolution which they might as well have proposed six weeks ago, save that Mr. GLADSTONE would not then have been able to threaten the House quite so forcibly with the consequences of preserving its consistency. The debate consisted practically of the three speeches we have mentioned, the last two of which—Sir STAFFORD NORTHCOTE's and Sir R. CROSS's—disposed of Mr. GLADSTONE's between them, of some eloquent denunciations of Mr. BRADLAUGH by Mr. SULLIVAN and Mr. P. J. SMYTH, and of many frank confessions from members of the majority as to the extreme discomfort they felt in voting with Mr. GLADSTONE. It was personally, said Mr. PARNELL, "an odious "task to him" to do so, and we may be sure that the Government will have to compensate Mr. PARNELL heavily for his self-sacrifice. The silence of the more important members of the Ministry was eloquent enough; and indeed there are probably few members of the Cabinet who would have liked to endorse their leader's speech. But,

not the less, some three hundred members answered to the crack of the Government whip, and the resolution passed by fifty-four.

The result can hardly have been much of a surprise to any one, though to all who set store by the dignity of the Parliament of England it cannot but be a cause for uncomfortable reflection. It seems, indeed, hardly conceivable that two months after a general election in which Government was placed in power with a majority floating from a hundred to a hundred and fifty, the strenuous party efforts used on this occasion should have failed of their effect. How strenuous those efforts have been there is no need to say. Not merely has full use been made of the ordinary means of enforcing party allegiance, but the pressure of local caucuses and wirepullers, has been strained to the uttermost. That the majority under the circumstances should have been barely half the normal Ministerial majority is perhaps the surprising thing. But there can be no doubt that the victory has been won at a heavy cost. Rarely in any debate has the argument been so entirely against the winning side; still more rarely have the arguments which that side was constrained to employ been of so damaging a description. The shamefaced converts who, after voting against Mr. LABOUCHERE, voted for Mr. GLADSTONE, themselves protested faintly against the contention that the doors of the House were necessarily to be opened to any blusterer who knocked long enough and loud enough. The "wry face" which Sir HENRY JACKSON openly made over the "unsavoury sauce" with which the standing dish of civil and religious liberty was on this occasion served up, must have had its like on scores of countenances among those who voted as Sir HENRY did. Here and there perhaps some guileless soul may have comforted himself with the childlike faith of Mr. BORLASE, that, the PRIME MINISTER being a good man, all that he proposed must be good too. But we can hardly pay the majority the bad compliment of supposing that there are many Mr. BORLASES in their ranks. They did their duty according to their party lights; but duty overstrained in this way is very apt to avenge itself on those who have so strained it. Of the merits of the question enough and too much has been said, nor is there any need to deal with them further. By tardily and reluctantly assuming the responsibility they have so long declined, and by applying the sheer weight of numbers, the Government have succeeded in forcing upon the House a member whose right to sit has thus far been affirmed by no constituted authority—for it must never be forgotten that a resolution can give no new right—while it has been denied by more than one. It is very doubtful whether we have yet seen the last of the BRADLAUGH difficulty. But, as far as its latest stage is concerned, three things may be asserted without fear of contradiction. In the first place, the Government has dangerously strained the allegiance of its majority. In the second, the Liberal party has shown a "sheeplike docility" far exceeding anything of the kind that the extremest exaggeration ever charged against its predecessor, the Conservative majority in the last Parliament. Lastly, the PRIME MINISTER, by holding the misconduct of Mr. BRADLAUGH *in terrorem* over the House, has set a precedent the danger and disgrace of which it is impossible to exaggerate, and at which even he, reckless as he has often proved himself of the dignity of Parliament and the decencies of statesmanship, might have been expected to hesitate.

MR. FORSTER'S LAND BILL.

MR. FORSTER'S speech in no degree mitigated the aversion and repugnance with which his Compensation Bill is regarded by all who are interested in maintaining the rights of property. His ostentatious and irrelevant defiance of the Land League agitators had by anticipation been made ridiculous, inasmuch as Mr. PARNELL had already, with well-founded exultation, announced that the Government had borrowed the principle, and even the wording, of the Bill from Mr. O'CONNOR POWER. The agitators against ownership of land can well afford to laugh at the strong language of Ministers who practically accept their anarchical doctrines. It was only in the peroration of his speech that Mr. FORSTER, for the purpose of reassuring his terrified English supporters, indulged in magniloquent professions of his resolution to vindicate the law. In other passages he disclaimed personal sympathy with the movement in which the Government now concurs. He said that he could not altogether agree with Mr. O'CONNOR POWER, whose Bill there had not yet been time fully to consider. A Minister who held the principles which have till lately been common to all parties would have made up his mind in five minutes, after a glance at the Bill, that it involved deliberate confiscation. Mr. FORSTER gave further reason for uneasiness and anxiety by attributing to the shortness of the Session the postponement of a more comprehensive measure. It seems that in the recess the Government purposes to elaborate a new Irish Land Act, which will necessarily involve additional spoliation. It had been thought that the branch of the upas-tree which symbolizes Irish land tenure had been effectually cut off in 1870. Mr. GLADSTONE then insisted on the exceptional circumstances which might be thought to justify novel and alarming legislation. The fear which, in spite of his protestations, was expressed at the time that the anomaly might be converted into a precedent is confirmed by Mr. FORSTER'S Bill for the suspension of rent in parts of seventeen counties, and by his mysterious warning of a more sweeping measure for the ensuing year. For the purpose of proving that the Compensation for Disturbance Bill was a logical consequence of the Land Bill, Mr. FORSTER referred, not to the Act as it forms a part of the Statute-book, but to the Bill in the form in which it left the House of Commons. The amendments made in the House of Lords must necessarily have received the assent of the House of Commons; but it would seem that to the revolutionary temper one branch of the Legislature appears to be entitled at any future time to repudiate a compromise which is embodied in an Act of Parliament. Mr. FORSTER complacently expressed his conviction that the present House of Commons would not be more tender of the rights of landowners than the House which was returned in 1868. His hopes are probably not too sanguine. The largest section of the Liberal party will cordially support the Government which, through the mouth of one of its most respectable members, attacks or menaces the foundations of property. Moderate Liberal members, though since the beginning of the Session they have been both irritated and frightened, will for the present submit to be dragged onward by their uncongenial allies.

It is true that the Bill has a narrow limit of time, although it extends over a wide area; but the disposition of the peasantry to resist payment of rent will be confirmed and stimulated by the temporary and local concession of their demands; nor is it improbable that two years hence Mr. FORSTER or some other Irish Secretary may cite this year's Act as a precedent for permanent legislation. Malcontent occupiers will not fail to discern the connexion between the bloodthirsty outrages which Mr. FORSTER denounces and the sudden pliancy of a Liberal Government. Mr. GLADSTONE had already told them that the Clerkenwell explosion facilitated the destruction of the Irish Church. The disturbances which have attended the anti-rent agitation will be associated in the Irish mind with Mr. FORSTER'S conversion to the doctrines of Mr. PARNELL. Mere expressions of disapproval, however sincere, will be regarded either as results of lingering prejudice or as concessions to English opinion. Savage assaults, mutilation of cattle, and occasional assassinations may be censured in Parliamentary speeches, though never in the popular harangues of Mr. PARNELL and his associates. The districts in which agrarian crime chiefly prevails have been rewarded by exemption from the payment of rent. Landlords and agents concur in stating that the service of evictions is the ordinary machinery by which rent is collected. The tenant, though he may have the money ready, habitually takes his chance of escaping payment until a notice to quit overcomes his hesitation. The Bill which virtually prohibits evictions by making them conditional on a complicated process of litigation, enacts relief from payment during the time and within the area of its operation. The disturbances which have been reported within a few days from the county of Leitrim illustrate the lamentable condition of the country. At Carrick-on-Shannon, which is included within the limits of the Act, a gentleman pursued by a raging mob, having at last fired in self-defence, was brought before the magistrates on a charge of manslaughter. On his passage to and from the Court a savage crowd, consisting partly of militiamen, fiercely attacked the police for the purpose of wreaking their vengeance on the prisoner. The militia officers in vain attempted to confine their men to barracks; but the courage and discipline of the constabulary enabled them to resist superior

numbers, and to capture one of the ringleaders. At last they were compelled to surrender the militiaman to his comrades, who carried him in triumph to the barracks. It remains to be seen whether the Government will allow an armed force, nominally in the service of the QUEEN, to engage in open insurrection with impunity. Irish patriots sometimes affect to resent the refusal of successive Governments to raise volunteers in Ireland. When the militia attacks the constabulary, it is time to suspend affected confidence in the loyalty of mutinous rebels. It would be interesting to know whether Mr. GLADSTONE includes the apt disciples of Irish demagogues in the numbers of that community which is annually increasing in knowledge, wisdom, and virtue.

There is no doubt that the most turbulent districts are in many instances suffering great distress. It is proper and necessary to make efforts for the relief of suffering; but there is no reason why the whole burden should devolve on the landlords, who are otherwise exposed to heavy losses and difficulties. There can be no doubt that Lord SPENCER, who is charged with the conduct of Irish business in the House of Lords, thoroughly shares the feelings of the Irish peers who day after day appeal to the Government for aid and protection. Mr. FORSTER, as a just and humane man, may also sympathize with the victims of lawlessness and anomalous legislation; but he offers them neither advice nor consolation. In some parts of his speech he showed a consciousness of the abnormal character of his proposal by reducing to the lowest point the extent and importance of the measure; but, if it had been true that its operation would be comparatively insignificant, a gross violation of principle for the sake of a trivial advantage would have been wholly inexcusable. The Irish agitators who are for the moment reconciled with the Government care far more for the principle involved in the Bill than for the prevention of the few evictions which might have occurred in the scheduled districts. They appreciate at its true value the elaborate provision by which the County Court Judge is required to determine whether "the "tenant is willing to continue in the occupation of his "holding upon just and reasonable terms as to rent, "arrears of rent, and otherwise." The tenant will in every case be not only willing, but determined, to remain in occupation of his holding. To the amount of rent which he has no intention of paying he will probably be altogether indifferent. Mr. FORSTER has for the present avoided direct recognition of the demand for fixity of tenure. It will be nominally possible under the Act to evict a tenant for non-payment of rent; but few landlords will undergo the risk and cost of asserting their claims. The argument that the Bill only renders compulsory conduct which ought to be voluntarily pursued has been employed in other cases to excuse interference with legal rights. As it is admitted that the great majority of Irish landlords are patient and considerate, tenants would be seldom threatened with eviction unless it was known that they were able to pay. Under the Bill payment will be the exception, if indeed the rule of withholding the rent is in any case violated. The most serious of all Mr. FORSTER's arguments was his statement of the difficulty of protecting process-servers, especially in Galway; but a confession that the Government is not strong enough to enforce the law is highly unsatisfactory, though it may possibly be sometimes unavoidable.

On the second night of the debate Mr. TOTTENHAM's illustration of the practical effects of the Bill was a more than sufficient answer to all the arguments which were afterwards urged in its favour. It seems that Mr. KINGSMAN, who has undertaken a larger expenditure for the relief of the people than any other Irish landlord, has, on the appearance of the Bill, suspended all his works, and, if it is passed, he proposes to leave the country. Mr. LAW aggravated, if possible, the distrust inspired by the Government measure when he dug up an obsolete Scotch statute which was supposed to provide for release of liability to rent whenever there is a bad harvest. Mr. ROUNDELL was possessed with a strange notion that the Bill would be justified by a proof that its principle was implicitly contained, not in the Act of 1870, but in the Bill as it left the House of Commons. Mr. GLADSTONE would perhaps not have passed the Land Act if he had not consistently declared that it was an exceptional and final remedy for a formidable evil and that its provisions would not be drawn into a precedent. He then mulcted many Irish landlords of a third of their property; and now Mr. ROUNDELL contends that it is only consistent to carry the practice of spoliation further. Mr. GLADSTONE's speech will be expected not less anxiously than the division. Prudence would require that the tendencies of the Bill should be as far as possible minimized; but Mr. GLADSTONE may perhaps take occasion to proclaim in the House of Commons his conversion to a modified form of Socialism.

THE FRENCH FÊTE.

THE French nation is going to have a new solemn national fête day, and on the 14th of this month is to celebrate the taking of the Bastille. It cannot be quite happy without a fête to show that it is happy. The pomp, the fuss, the display, the gaiety of a holiday are dear to the French heart; and a Government that does not give France a fête seems a poor sort of thing, either not alive to the national tastes, or not sufficiently sure of its own position to venture to gratify them. The Republic decrees a fête, both to please the nation and to certify to itself and to the world that it is a solid, permanent, indissoluble institution. The Exhibition two years ago answered the purpose of a grand inauguratory fête to start the Republic triumphantly on its career. But an Exhibition only comes once in a way, and the French want a fête to which they can look forward or backward as the grand day of each year. The present Government has recognized the expediency of consulting the popular taste, but may have had some difficulty in deciding what day should be kept, and why. It is obvious that, if a fête is to go off really well and to please every one, it must be held in the summer. It so happened that the great NAPOLEON was born on the 15th of August, and thus, as long as there was an Empire, there was a very convenient day in the fine season on which to celebrate an historical event, glorify the dynasty, show off uniforms, and please the people. The day was also the day of a great Catholic festival, and religious and political associations combined to give importance and dignity to the fête of the NAPOLEONS. The Republican Government is not so lucky. It could, of course, have chosen a day at random in the summer, as we have chosen our summer Bank holiday, and have decreed that there should be a national fête on the first Sunday in August. But, although the people would thus have had a fête, they would not have in any way associated their fête with the Government. There is nothing Republican about the first Sunday in August, and to have chosen such a meaningless day would have been taken as a confession that no day could be found of which the Republic could be specially proud. Under these circumstances, to select the anniversary of the taking of the Bastille offered some conspicuous advantages. The Fourteenth of July is the day of a very well-known historical event; it was unquestionably a Republican thing to destroy a royal fortress and prison, and the summer season is then at its height. These advantages have been held to outweigh all attending disadvantages. But it may be permitted to outsiders to suggest that these disadvantages are not slight. The taking of the Bastille was only one incident in the long series of events which make up the story of the French Revolution. It was not a particularly glorious incident, for a furious mob only overcame the resistance of a few score of bewildered, broken-down old soldiers, and the capture was sullied by the cruel massacre of those whom the leaders of the enterprise had pledged themselves to protect. It seems scarcely worth while at this long distance of time to make any great amount of solemn fuss about an event which, after all, was only one instance, and not a very creditable instance, of the force of insurrection.

But there can be no doubt that to French Republicans there has always seemed something especially romantic, inspiriting, and even grand in the taking of the Bastille. The news that the great prison had been taken and was to be razed was hailed throughout Europe as a sign that a new era had dawned and that the people were to be greater than the kings. Even at St. Petersburg, we are told, men of all nations flung themselves into each other's arms and wept, or were taken to weep, for joy. The amiable COWPER had already assured his readers that there was not an English heart that would not leap to hear that the horrid towers of the Bastille had fallen,

The Bastille was in the eyes of liberal Europe, as well as in the eyes of revolutionary France, the symbol of all the iniquities and all the misdeeds of the Kings of France; and the pathetic histories revealed, or surmised, when the Bastille was taken, aroused an indignation against the monarchy responsible for them which only faded away before the greater indignation excited by the atrocities of the Jacobins. At Paris it was a genuine detestation of the pitiless secret tyranny of which the Bastille had been for generations the theatre that prompted the mob to make it the primary object of attack. Some time previously the Government, moved by the excitement which MIRABEAU had awakened by his publication on *Lettres de cachet*, had turned the keep of Vincennes into a storehouse for grain, and the populace, having been permitted to visit what had so lately been the cells of a prison, were full of the discoveries of black and cruel deeds which they made. What they had seen at Vincennes made them guess what was going on inside the Bastille. COWPER was quite right, and English hearts still leap in a moderate degree at the thought that the horrid towers fell. If a mob was to pull down anything, it could not pull down anything that better deserved to be pulled down than the Bastille. We have to force ourselves to forget the cruel and treacherous massacre of the old soldiers, and then we can derive whatever satisfaction anything that happened abroad nearly a century ago can give us when we think that the horrid towers were thrown down, and their stones made into a bridge so that the feet of the people might always trample on them. But it is hard to understand how to persons of this generation the taking of the Bastille can seem what it seemed to those who were alive to hear of the news. To them it was something unprecedented, and with unknown consequences. We know that the Bastille had its successors; that the massacres of September were far more atrocious than any of the deeds wrought in the Bastille; that NAPOLEON built a whole nest of State prisons in Paris, and that many times more human beings suffered greater misery during the six months which followed the *Coup d'état* of the Second NAPOLEON than was witnessed in half a century in the Bastille. The taking of this prison was the beginning of doing strong things on high principles; but it was not the end; and subsequent events have dwarfed the importance of what in its hour seemed a very great thin indeed.

Students of history may easily satisfy themselves that the taking of the Bastille produced very important results on the train of events then occurring in France. The union of the three orders was completed, and the consti tuent Assembly organized on June 27. Then the Court turned against the Assembly, and determined to bring up troops and overawe it and Paris. NECKER was dismissed on the 11th of July, and on the 12th the Swiss and German regiments were ordered to act in Paris. Then the revolution began. The French troops fraternized with the Parisians, the people armed themselves, and in forty-eight hours the Bastille was taken. The KING accepted the taking of the Bastille as a sign that all resistance was useless. He went to the Assembly pled ing himself to recall NECKER and to send away his foreign troops, and he himself went to Paris, and entered it in the new character of a submissive and patriot King amid the applause of the populace that had just captured his prison. Then the taking of the Bastille started the emigration, and the KING's brothers and their friends concluded that a country in which such things could happen was not a country in which it was safe for them to live. Lastly, the fervour of Paris quickly spread to the provinces, and became so intense and so potent that the Assembly was fired with a new spirit, and only three weeks after the Bastille was captured there took place the famous sitting of the Fourth of August, when the nobles and clergy solemnly abandoned all their privileges, and the reign of equality was started in France. No one, therefore, can deny that in the history of France the destruction of the Bastille meant much more than the razing of one stronghold of regal tyranny. It not only started the French Revolution, but it impressed a special character on the Revolution. It went far to make it republican, and it tended to create an association of equality with liberty. For the purpose, however, of giving occasion for a popular fête these historical considerations seem rather too recondite. They are very good grounds why an historian should carefully assign to the taking of the Bastille its peculiar place in the annals of the time; but they are scarcely grounds why people should dance and fire guns on the anniversary of the day. On the other hand, if the new Republic is to have its fête day, and to keep alive some stirring Republican memory, it is not easy to see what better day could be chosen. For the taking of the Bastille is an event really well known. Every Parisian can point to the place where the Bastille stood. Every Republican thinks the taking of the Bastille was a glorious triumph for those who became the fathers of French Republicanism. It may be said of it, as of the Republic itself, that as an occasion for a fête day it divides Frenchmen the least. There is probably no other event of Republican history as to which there is among French Republicans so much unanimity of approval. Even Frenchmen of other parties would scarcely venture to say that they did not think it a good thing that a place of arbitrary and secret imprisonment has vanished. The event may not be worth celebrating by an annual gala-day; but, if there is to be such a gala-day, the taking of the Bastille is not perhaps a bad choice to make for the Republican anniversary.

SOUTH AFRICA.

THE collapse of the South African Confederation scheme, though it may be in some degree disappointing, ought to cause little surprise. None of the colonies, and, it may almost be said, no party in any colony, has cordially entertained the project. The policy of federation was perhaps discredited by its origin in Downing Street. Colonists habitually suspect the Imperial Government, not without reason, of a desire to relieve itself from troublesome liabilities. The motives of Lord CARNARVON, of his advisers, and of his successors were primarily disinterested, especially as far as they related to the general application of a theory. English statesmen take pleasure in encouraging the formation of great communities, sufficiently strong and ambitious to be able and willing to manage their own affairs; but colonists never give them credit for any but selfish motives. The Dominion of Canada possesses in trade, in shipping, and, above all, in extent of territory, many of the attributes of a great State, although it is not at present desirous of formal independence. Since the establishment of the present Constitution, Canada has been on the whole prosperous and well governed, though the population is still scanty in proportion to the vast extent of territory. The sovereignty of England, though in ordinary administration it is almost nominal, involves the substantial merit of operating as a permanent alliance. The mother-country endures vexatious fiscal legislation with a patience which is confirmed by the difficulty or impossibility of resistance. On the whole, the Dominion is regarded with a kind of friendly complacency which naturally suggested the desire of reproducing elsewhere copies of an approved model. The Australian provinces have as yet shown little disposition to commence the fabric of a future Empire spreading over a Continent. Their habitual jealousy of Imperial interference would have been instantly aroused by any proposal that they should obliterate their internal frontiers by combining with their neighbours in a confederation. For the purpose of repeating the Canadian experiment it was necessary to look elsewhere.

The Cape Colony and the neighbouring provinces possess an extensive territory occupied by a scanty and divided population. Differences of race and language have a tendency to degenerate into feuds, and some of the recently settled provinces are too weak to stand alone. The various dependencies are in unequal degrees exposed to a common danger from the warlike tribes which enjoy total or partial independence beyond the frontier, and of which a portion live within the colonial dominions. It would be expedient both to institute a consistent policy as to the control of native affairs and to organize in case of need common means of defence. Unfortunately the dangers and difficulties press with unequal force on the various provinces; and the most considerable community in South Africa is least liable to insurrection and invasion. Neither the English nor the Dutch inhabitants of the Cape Colony feel themselves concerned to defend the remoter districts at their own expense; and Natal and Griqualand would, as long as they had the choice, rather rely on English protection than on the doubtful aid of the larger colony. In

all serious native wars the brunt of the conflict has fallen on the Imperial army. The solicitude of successive English Ministers for confederation was throughout South Africa too exclusively attributed to a desire of relief from an onerous duty. In the Cape Colony the question was further complicated by the wish of the English settlers in the Eastern province for separation or local independence. It is not surprising that Mr. MOLTENO, while he was at the head of the Colonial Ministry, uniformly resisted the pressure which was applied to his Government by Lord CARNARVON. It was only through the popularity which rewarded Sir BARTLE FRERE'S personal influence and his active sympathy with colonial aspirations, that he was enabled apparently to reverse the policy of the Cape Parliament, and to place the Opposition in office. It now appears that he must have been mistaken in believing that Mr. SPRIGG was a cordial supporter of the principle of confederation. The Assembly has in the same session declined to proceed with the process of confederation, and passed a vote of confidence in Mr. SPRIGG and his colleagues. It is not at present known whether Sir BARTLE FRERE retains the popularity and influence which he lately enjoyed. It will for the time be wholly useless to revive the project of confederation, which indeed was in the colony at all times an unwelcome exotic.

The English Government will now be forced to form a decision on two questions of unequal importance. The agitation for the recall of Sir BARTLE FRERE will be immediately revived, and Mr. GLADSTONE will be reminded that his unwise and ungenerous excuse for retaining his services no longer exists. It is probable that no other Governor would have been more fortunate; but it may be admitted that Sir BARTLE FRERE'S presence in the colony is no longer indispensable. Sir G. P. COLLEY is already entrusted with the charge of governing the provinces which principally require protection from native hostility. The same officer is responsible for the difficult duty of conciliating or coercing the Dutch malcontents of the Transvaal. There had been reason to hope that the province might be contented with a share in the proposed federal organization. It may now be difficult safely to withdraw the Imperial protection which was imposed on the Transvaal as a substitute for independence. Every day which passes increases the objections to a simple withdrawal from a position which was too hastily assumed. The Cape Colony will not provide the means either of maintaining the authority of the Crown in the province or of defending it in case of need against the hostile tribes which may at any time threaten its safety. The doubtful loyalty of a portion of the community must for the present be maintained by force. The same embarrassment will apply in an inferior degree to all the minor dependencies. Without the aid of English troops, Natal might at any time find itself unable to cope with a rising of the native population, or with renewed hostility on the part of the Zulus beyond the border. It is useless to recur to the origin of the present complications in the precipitate grant to the Cape Colony of a Constitution of the modern type. The grant of practical independence may have been indiscreet, but it is now irrevocable. The arrangements which might have been made if all the South African provinces were still directly governed by the representatives of the Crown are now impracticable. If it were still worth while to criticize the action of a former Government and Parliament, it would probably be found that any mistake which may have been committed was caused by a pedantic desire of uniformity. Parliamentary institutions of the democratic type are perhaps scarcely applicable to a community belonging to two European nations, with a large numerical majority of uncivilized natives.

If Sir BARTLE FRERE is recalled, perhaps even the Government will regret the paltry injustice which was, in deference to popular clamour, inflicted on him by the reduction of his salary. In not immediately resenting the affront, he both consulted his own dignity and declined to relieve the Government from the responsibility of cutting short his tenure of office. His administration will be more favourably remembered by the colonists than by his countrymen at home. His resolute character, his hearty sympathy with local feelings and prejudices, and even his occasional use of strange Puritanical phrases made him popular both with the English and the Dutch. The grave error of the unnecessary Zulu war was never thoroughly recognized either at the Cape or in the more Easterly provinces; and the success of the enterprise obscured its questionable nature. As far as it is at present possible to form a judgment, the Zulu power is for a long time broken by the division of authority among a number of petty chiefs. The minor hostilities which followed the overthrow of CETEWAYO have reduced other turbulent chiefs to submission; but sooner or later native wars will probably recur; and for some time to come it will be impossible to follow the precedent which Lord GRANVILLE established in New Zealand by the complete withdrawal of English troops. The extension of responsible government to the minor provinces may with advantage be indefinitely postponed. The Transvaal would instantly rebel if the Dutch settlers were allowed the absolute control of their own affairs; and the Imperial Government has undertaken the responsibility of protecting the English minority and the large native population from the oppression to which they might be exposed. Colonial Secretaries have no reason to fear that they will be deprived of the opportunity of exercising in the conduct of South African affairs any statesmanlike qualities which they may possess.

CONFLICTS WITH ROME.

THE French and the Belgian Governments have each an ecclesiastical quarrel on their hands, and it is hard to say which is managing it worst. In one respect, no doubt, the French Government may claim the prize for unwisdom. The expulsion of the Jesuits is a more glaring error than the withdrawal of the Belgian Legation from the Vatican. Its injustice and its violation of the elementary principles of personal liberty are so conspicuous that it seems impossible that they should long escape recognition, even in a country where theological and anti-theological passions run so high as they do in France. The magistracy has, to a considerable extent, avoided, by resigning office, having anything to do with the execution of the decree; but even the inferior ministers of the law can scarcely love the work to which they were put on Monday last. It is necessary, no doubt, that there should be bailiffs in the world; but decent people have seldom cared to play the part; and even a bailiff could not well be more unpleasantly employed than in turning a few old men out of houses in which, as French citizens, they might naturally have supposed that they had a right to remain as long as they were unconvicted of any crime. The First Republic did many things more violent and more cruel than the expulsion of the Jesuits, but it did nothing more inconsistent with personal freedom. If the Jesuits have committed any offence against the State, the Courts are open, and there are Deputies; but the principle, whatever it is, which is held to justify the Government in turning the Jesuits into the street, would equally sustain any exercise of arbitrary authority to which the Executive for the time being might choose to resort. Probably the Advanced Left have ceased to include the return of their enemies to power in their list of possible events, and they are not, therefore, open to the argument that it is well, on grounds of mere prudence, to do as you would be done by. But even they might remember the effect which their policy is likely to have upon that large section of the French public which has the misfortune to be less advanced than it should be. There are abundance of teachers ready to suggest to these timid spirits that, though it is the turn of the Jesuits today, it may be their turn to-morrow. The Extreme Left is grandly impartial in its hatreds. Individual property is as obnoxious to it as religious beliefs; and the arguments which are now used to justify the expulsion of priests from their houses may hereafter be used to justify the taking of houses from their lay owners. The will of the majority is as good a plea for the one act as for the other. Nothing is likely to come of this teaching for the present except a secret distrust of the Republican Government. But hereafter this secret distrust may bear fruit in unexpected ways. France may have seen the end of her changes of government; but he would be a very rash prophet who ventured to say that she had done so.

There is another respect, however, in which the French Government have more to say for themselves than the Belgian Government. There can be no doubt that the expulsion of the religious orders does cause very real annoyance and inconvenience to the Catholic Church in France. But the withdrawal of the Belgian Legation

from the Vatican inflicts no inconvenience on the Catholic Church, while it does inflict a real, if slight, inconvenience on the Belgian Government. There are occasions, no doubt, on which a suspension of diplomatic relations has a specific use. It is meant to frighten the Power from whom the envoy is withdrawn into making some concession, and the motive to which it appeals is the dread of still worse consequences remaining behind. So long as the POPE retained his temporal dominions, it was open to certain Powers to use this weapon against him, with a possibility of its having real effect. The withdrawal of the Sardinian Minister might have implied an impending attack on the States of the Church, the withdrawal of the French or Austrian Minister might have implied that this impending attack would be viewed with no displeasure. But under no circumstances could Belgium have made any impression upon the POPE by withdrawing her Minister, and the loss of the temporal sovereignty deprived even the great States, and the States most directly concerned with the POPE, of the power of using this weapon with any advantage. Now that the POPE is only a spiritual sovereign, the use of keeping a Minister at the Vatican is not to put pressure on the POPE, but to observe him and to reason with him. When any considerable part of a nation accepts this spiritual sovereignty, this function of observation and reasoning may be very important. It has often been remarked that, if England had had a Minister at the Vatican, and the POPE had had a Nuncio in London, the ridiculous episode which began with the introduction of the Ecclesiastical Titles Bill and ended with the repeal of the Ecclesiastical Titles Act would never have happened. The Minister would have explained to the POPE what an unforeseen excitement the creation of the territorial bishoprics was raising. The Nuncio would have told the English Government that the POPE would much rather do what he wanted to do quietly than noisily, and some arrangement would have been come to by which this country would have been spared the humiliation of a perfectly fruitless agitation. In Belgium a very angry controversy is now raging about an Education Act. To Englishmen it seems that the Act in question is a very harmless one, and that the Catholic clergy have made a grave mistake in opposing it. The Belgian bishops take a different view of the situation; and, as they are bishops of the type beloved by the late POPE, they give expression to their view in the language and with the weapons which the late POPE was accustomed to use. There is a great deal of cursing and swearing going on on both sides in Belgium just now. Teachers who obey the law are excommunicated, and the supporters of the law, not being able to launch a return excommunication, do what they can in the way of newspaper articles. They feel, however, that the artillery on the other side is of heavier metal, though it may not do more destruction, and it is their irritation at this apparent inequality that has led to the withdrawal of the Belgian Legation from the Vatican. It is a slight on the POPE, and as such its being offered brings some small consolation to their wounded feelings. If they had stopped to calculate consequences, they would have remembered that the suspension of diplomatic relations with the POPE will not stop communications between the POPE and the Belgian bishops. The post, the telegraph, and newspaper enterprise have put it beyond the power of any Government to do this. The only communications that will be stopped will be those that might otherwise have passed between the POPE and the Belgian Government. Now under no possible circumstances can it be an advantage not to be able to hear what your adversary wishes to say, or to say to your adversary what you wish him to hear. You are not obliged to pay any attention to what he says, and you need not speak to him unless it is convenient; but to shut out the possibility of doing either, no matter how convenient it may be, is to spite yourself, in any case, quite as much as, and in the present case a great deal more than, your adversary. The POPE will now hear the bishops' story only. There will be no Nuncio at Brussels, and no Minister at the Vatican, from whom the POPE can get accounts of what is going on in Belgium. If the Government wish to say something to the bishops informally, there will be no Nuncio to use as their intermediary. If they wish to make a representation to the POPE, they can only do it through the good offices of some other Minister. Thus there are two things that they may easily have occasion to do at any moment which they have for the future cut themselves off from doing, and they have submitted to this sacrifice for the mere pleasure of shaking their fists in the POPE's face, knowing perfectly all the time that they cannot get within arm's length of him.

There is one curious feature in these ecclesiastical struggles which is visible alike in France and in Belgium. The Governments have recourse to desperate measures just when desperate measures might seem to be least needed. If M. JULES SIMON could have expelled the Jesuits when he was in office under Marshal MACMAHON, there might have been some sense in it. The 16th of May was impending, and the Jesuits, as M. SIMON probably knew, were the leaders of the conspiracy. But M. DE FREYCINET expels the Jesuits when he has the Executive, the Legislature, and the country all on his side. If these questionable decrees make any difference in his position, they must weaken rather than strengthen it. The fact that he has the power to issue and execute the decrees shows that the Jesuits cannot really cope with him, while by making use of the power he runs the risk of exciting sympathy on behalf of those against whom his strength is directed. It is the same with the Belgian Government. If the elections had gone against them and they were merely holding office until a vote of want of confidence should have been passed, there might be some reason in an exercise of power which would at least give their opponents something to undo. As it is, however, they have gained slightly at the elections, and for the present are safely seated in office. Consequently to withdraw the Legation from the Vatican is to strike a blow which would not be wanted even if it were one that could do them any good. It is curious how political disputants seem to lose their heads when they get involved in ecclesiastical quarrels.

ELECTION PETITIONS.

THE judgment in the case of Plymouth stands out in striking relief from among all judgments that have ever been given on an election petition. The mere legal point on which the decision turned was simple enough. Sir EDWARD BATES, the Conservative sitting member, who represented the borough in the last Parliament, had been returned at the head of the poll, and had been most lavish and persistent in his benefactions for some years to various needy institutions and persons in Plymouth. But the Judges passed over the allegation that this amounted to what is technically known as nursing the borough, and confined their attention to an instance of bribery. It was proved that an agent of Sir EDWARD BATES had gone to Penzance, where some fishermen voters of Plymouth were stationed, and had provided one voter with a substitute for the day. The voter thus got a holiday without losing by giving up work, and the Judges held that this was bribery by an authorized agent, and pronounced the election void. The law was thus vindicated, and nothing would have called for observation had it not been for the language which the Judges thought proper to use in giving their judgment. Mr. Justice LUSH inveighed against the law which he was called on to administer. He much regretted that he had to unseat a member merely because one agent had done something wrong. He apparently thought that the chief object to be considered was not the purity of elections, but the feelings and position of a sitting member. Poor Sir EDWARD! To have come in at the head of the poll, and to have given away so much money, and made so many friends in Plymouth, and then to be turned out into the cold simply because a man named HIBBS had bribed a wretched trawler at Penzance. It really was most mortifying, and Mr. Justice LUSH condoled with the sufferer, and told him how much he pitied him for having to live under the reign of an absurd Draconian Act of Parliament. But, if these are natural sentiments in a humane, pitiful, and sympathizing Judge, it is equally natural that a very different impression should be made on the House of Commons by what had taken place. Mr. PULESTON, on Thursday night, asked the HOME SECRETARY whether he had any intention of altering the law so as to meet the views of kind-hearted Judges. Sir WILLIAM HARCOURT answered that he had no intention of the sort, as the House has to think of purity of election, not of the feelings of disappointed candidates; and it is obvious that all attempts to enforce purity of election would be at an end if the law was to

consider, not whether bribery had been committed, but whether the candidate might be reasonably disappointed at losing his seat when little positive harm had been done. To get sufficient evidence of a distinct breach of the law is the difficulty of those who are bringing an election petition. They find traces of this and that having been done which they suspect was wrong. They are always on the edge of a proof which constantly eludes them. At last they hit on what seems to them a clear case. They find that, if this case can but be established, they must win. They procure clear and trustworthy evidence that the law has been broken, and they concentrate their efforts on bringing this one sufficient charge home. So far as petitions promote purity of election, this is the way they work. They make the agents of the petitioners hunt over all the ground where corruption is suspected. If they can get a clear legal case, they know they will succeed; if not, they know they will fail. It would not be worth while to hunt at all if, as the result of the trial, they were to be told that certainly the law had been broken, but that a nice kind honourable gentleman was not to lose his seat for a trifle.

But the language of Mr. Justice LUSH was as nothing to the language of Mr. Justice MANISTY. Both Judges were indignant, but they were indignant with different things. Mr. Justice LUSH was indignant with the law; Mr. Justice MANISTY was indignant with the malicious persons who set the law in motion. He attributed their malice to party spirit. They had allowed this wicked spirit so far to get the better of them that they had not accepted their defeat at the poll in a meek and Christian temper, but had endeavoured to turn out an excellent person who had been triumphantly returned at the top of the poll. Most unfortunately they had succeeded. They had brought home a charge of bribery; but Mr. Justice MANISTY had too much reason to believe that, as Liberals, they enjoyed turning out a Conservative member. We may go further, and fear that they had been actuated by party spirit throughout, and had all along tried to defeat Sir EDWARD BATES because he was a Conservative and they were Liberals. It is very sad, but such things will happen at election times. When they were beaten, they complained that they had not been fairly treated, and proved their case before a legal tribunal. There was party spirit, and it was the same throughout. If it was a sin in Liberals to wish to beat a Conservative, they were guilty of this sin persistently, for they used both the opportunities of gaining their horrible end which the law offers. They tried the poll and failed; they tried a petition and succeeded. But Mr. Justice MANISTY pointed out to them that not only had they been guilty of trying to get a member unseated merely because he was of different politics from their own, but their guilt had been attended by peculiarly awful consequences. He told them that by giving way to their detestable party spirit they had deprived not only the poor and needy of all creeds and denominations, religious and political, in Plymouth, but also the inhabitants at large, of a good friend and generous benefactor, and the majority of the constituency of a representative whom they had elected, and of whom they had good reason to be proud. This is new and astonishing doctrine. It is simply impossible to understand on what principles Judges hold that candidates may or may not give large gifts in boroughs. In the Boston case a member was unseated because some time before the election, in a time of great distress, he had given away large presents of coals. At Plymouth Sir EDWARD BATES has been held to have made lavish gifts innocently, because he was habitually a profuse benefactor, not only in Plymouth, but elsewhere. Now the petitioners are told that they have done something very wrong in stopping the flow of those benefactions at Plymouth. Mr. Justice MANISTY took for granted that Sir EDWARD BATES would not be such a fool as to spend a halfpenny in Plymouth unless he is to get a seat there as his reward. It takes one's breath away to find a Judge lecturing people for depriving the poor of presents which are only made in consideration of political favours. It used to be thought that one great use of sending Judges to try election petitions was to ensure as far as possible that presents of this sort should not be made. But this was not the whole of the offence of the petitioners. They were reproached by the Judge for having unseated a member whom the majority had elected. How are any election petitioners to escape this awful reproach? If Sir EDWARD BATES had not had a majority, he would not have been returned. All election petitions must necessarily be brought against candidates for whom a majority has voted. It would be interesting to know what would be, in the opinion of Mr. Justice MANISTY, a really proper election petition. It must be untainted by party spirit; it must not upset the decision of a majority; it must not deprive the poor of presents. Probably a petition brought by Conservatives against a Conservative at the bottom of the poll, who never gave a shilling to a crossing-sweeper, would come as near as can be imagined to this strange ideal.

Only one other decision calls for special notice. In the Down case the sitting member was saved by the new system of having two Judges. One Judge thought he ought to be unseated, while the other Judge thought he might retain his seat, and, as unanimity is required, he got safely through, each side paying its own costs. The point of difference was whether an election could be said to have been held under fair conditions when the agent of the candidate returned had flooded the constituency with publications asserting that the Ballot Act was a farce, and that the vote of every voter would be known. Whether this amounted legally to intimidation remains undecided; but the very strong opinion of Mr. Justice BARRY, that it did amount to intimidation, will probably do much to prevent such a practice gaining ground. At Thirsk the petition has utterly failed, the sitting member swearing that he had spent under 500*l.*, and did not intend to pay anything more. At Bewdley, Evesham, Tewkesbury, and Wallingford the petitioners have been successful; and, although bribery on a large scale does not appear to have prevailed, yet there was evidence to show that there is a section in these constituencies which, in the language of one counsel, must have money or beer before it will vote. All these boroughs are marked out for disfranchisement whenever Parliament takes up in earnest a new Reform Bill. But it is not so easy to deal with Gloucester, Canterbury, and Macclesfield, in all which thriving and important places there appears to be a permanent taint of corruption. It may be too sanguine a view to take, but still it may be hoped that election petitions will do something to efface this taint in places of this kind. Party spirit moves the friends of the defeated candidates to examine into the history of the proceedings of the successful candidate and his friends. What has been done on both sides becomes more or less known. The good gentleman, the friend of the poor, the worthy benefactor of the borough, loses his seat, and finds that all the indiscretions of himself and his friends have been brought to light and made the theme of general gossip. The presiding Judges may weep with him over his sad and most undeserved fate, may tell him what a pity it is that nasty laws should press hardly on so nice a man, and sing his praises as if he were a Lord Mayor who had just finished his year of office; but still they do turn him out. It is borne in upon him and his friends that it is hardly worth while to get a seat unless the election can be kept pure. The effect on the friends of the candidate is indeed much more important than that on the candidate himself. They wanted, under the inspiration of their horrible party feelings, to win the seat for a man of their shade of opinion. They worked hard, and in the result they find they have worked in vain. This must do them some good, and must teach them to be more watchful on another occasion. The only possible mode of preventing bribery in constituencies of a size to make bribery possible is to inspire the conviction that bribery will not answer. The law is strict enough if it is only enforced; and it must not be supposed that all Judges view election petitions with indignation. Lord COLERIDGE, for example, to whom, as Chief Justice of the Common Pleas, such matters fall, has shown very clearly that he will not allow petitions once presented to be lightly withdrawn. He wants to know why proceedings presumably meant to promote purity of election should be unaccountably brought to an end. Persons accustomed to courts would watch with curiosity the expression of Lord COLERIDGE'S face while he was perusing an affidavit in support of a withdrawal conceived on the lines suggested at Plymouth. He would scarcely conceal his surprise when he found the petitioners representing that since instituting proceedings they had been brought to a state of grace, that they feared they were animated by a wish to gain a seat for their party, that they had discovered that the

sitting member was returned by a majority, that they did not like to cheat the poor out of the large sums the sitting member was willing to give them as long as he sat; and that therefore, although they could establish a clear case of legal bribery, they wished to discontinue all proceedings that must annoy a good man, and might ultimately distress Mr. Justice MANISTY.

THE CINCINNATI CONVENTION.

THE Democratic Convention at Cincinnati has done its constituents the service of providing them with a nominee who will unite in his support the entire party. The proceedings were less dilatory and less complicated than the operations by which the name of Mr. GARFIELD was mysteriously evolved at Chicago. According to custom, a few tentative divisions were taken with the result of furnishing the managers of the election with information necessary for their purpose. Ingenious speculators who were not in the secret suspected that the preliminary votes were part of a scheme for insuring the nomination of Mr. TILDEN. The belief in his powers of political manipulation was so strong that his formal disclaimer of pretensions to the Presidency was interpreted as an elaborate contrivance for securing the nomination. If he had any design of the kind his ambitious hopes are disappointed. Those who really controlled the Convention intended from the first to nominate General HANCOCK, who had perhaps been originally selected in the expectation that he would be opposed to General GRANT. It was then doubtful whether the American people were not disposed to prefer military reputation to political ability. After GRANT, SHERMAN, and SHERIDAN, General HANCOCK is perhaps the most distinguished surviving soldier of the Civil War. He was the principal lieutenant of General MEADE at the battle of Gettysburg, which proved to be in its results the most decisive struggle of the war. SHERMAN is justly odious in the South in consequence of the wilful devastation which he committed in his celebrated march to Atlanta; and General SHERIDAN, in time of peace, solicited from General GRANT, then President, permission to establish and administer martial law in Louisiana. It also happened that General HANCOCK was the only Democrat among the general officers of the regular army; and he probably shares the opinion of the party as to the interference of the Federal Government in State elections. As soon as the proper time arrived, an overwhelming majority of delegates voted for General HANCOCK. The honorary office of Vice-President, with the contingency of possible succession to the higher post, was placed at the disposal of the Indiana delegates, who selected Mr. ENGLISH. The remainder of the summer and part of the autumn will be devoted to the final struggle, in which either party will muster its full strength. The outlying factions are more powerless than on any former occasion, though the anarchical Labour party, under the lead of Mr. DENNIS KEARNEY, has coalesced with the equally respectable advocates of greenbacks.

If personal qualities had any influence in the choice of a President, the Democrats would perhaps have an advantage over their opponents. Mr. GARFIELD served with credit as a volunteer officer and general during the war; but General HANCOCK is a professional soldier. On the other hand, GARFIELD may boast that he was engaged during his earlier years in manual labour, while HANCOCK was educated at West Point, which is sometimes denounced as an aristocratic institution. It may be presumed that Mr. GARFIELD is thoroughly familiar with the management of electoral assemblies, for he was charged at Chicago with the defence of the interests of Mr. SHERMAN, who is himself a master of the art. It is usual for a Presidential candidate to remain in the background; but he may direct and combine the efforts of his supporters. Mr. TILDEN, who is not a professed orator, managed his own election in 1876, though he was afterwards fraudulently deprived of the fruits of victory. He probably encouraged the exaggerated belief in his pecuniary resources which tended to stimulate the zeal and sustain the confidence of his adherents. General HANCOCK has an advantage over his predecessor in the Democratic nomination in his freedom from connexion with political scandals, true or false. Mr. TILDEN has in the course of a long and successful career often had occasion to touch pitch, and it is rather to be wished than to be hoped that he may not occasionally have been defiled. A more practical reason for [illegible] General HANCOCK to Mr. TILDEN is furnished by the political squabbles of New York. Mr. KELLY, leader of the Tammany faction, happening to hate Mr. TILDEN, allowed the Republicans to win the last State election by dividing the Democratic faction. He threatened to repeat the proceeding at the election of President, and there was no doubt that he would keep his word. The Democrats, though they will receive the support of all the Southern States, can only return a President on condition of obtaining the votes of New York and of another great Northern State. KELLY, who has since the nomination at Cincinnati resumed his party allegiance, insures the unanimous support of the State to General HANCOCK. Even the most devoted adherents of TILDEN must admit that his candidature would have been dearly purchased by the cession of New York to the Republicans.

No serious political issue is raised by the impending election. Both the Republicans and the Democrats, after long wavering and occasional apostasy, now profess the true faith of resistance to any depreciation of the currency. The Republicans are, of the two parties, the more strongly pledged to maintain the vicious system of Protection. Some of the Democratic leaders entertain sounder views, but it is doubtful whether they will risk their popularity by reduction of the tariff. The respect for State rights and for freedom of election which is professed by the Democrats has been practically shown by the actual Republican PRESIDENT throughout his term of office. Civil Service reform, which is urgently needed, occupies a conspicuous place in both the rival programmes; and it will be equally neglected or postponed under a Democratic or a Republican President. The proverbial phrase of "the "spoils to the victors" expresses the profound conviction of those who elect the President. His friends will be the victors; and they are not in the smallest degree inclined to surrender their perquisites. Mr. SHERMAN, who was once a Civil Service reformer, has lately employed all the numerous dependents of the Treasury throughout the Union in the promotion of his personal interests. The foreign policy and diplomacy of both parties will be the same. Since the abolition of slavery the Democrats have ceased to desire the acquisition of Cuba or of any portion of Mexican territory. The Republicans steadily opposed their own nominee when General GRANT had a fancy for the annexation of San Domingo. With most of the European States the American Government has little to do; but there are unfortunately always unsettled questions with England; and the pugnacious precedents of former times are invariably followed. Mr. EVARTS's successor, whoever he may be, will be as peremptory as the present SECRETARY of STATE in demanding satisfaction for the doubtful injuries which are supposed to have been suffered by New England fishermen in Newfoundland. A Democratic Secretary might not improbably, if occasion offered, even emulate Mr. EVARTS's wonderful application to the English Government to remit the damages awarded to Canada by the arbitrator. Neither a Republican nor a Democratic Congress will be advised by the President to refund the excess of the *Alabama* damages which were wrongfully recovered. It may be hoped that General HANCOCK, if he is elected, will not revive the practice of Democratic Presidents before the war, who, with the exception of Mr. BUCHANAN, always included an attack on England in each of their Messages to Congress. It is perhaps natural to make the most of foreign complications, which are few and rare. The most formidable question which may be raised relates to the novel claim of an exclusive right to the control of any passage which may be formed between the Atlantic and the Pacific.

The leaders of both parties are probably by this time occupied in the construction of imaginary Cabinets. A newly-elected President generally offers a certain number of places to the defeated competitors for nomination; he has also to reward his principal supporters; and he must consider the claims of some of the great States. Mr. GARFIELD, who was the confidential election agent of Mr. SHERMAN, will probably, if he has the opportunity, reappoint his former patron to his present office. Mr. BLAINE is entitled by usage to a seat in the Cabinet. Mr. CONKLING will probably, like General GRANT, be excluded, though he will still be powerful as a Senator and a party leader. A Democratic President will not have an equal abundance of conspicuous aspirants to office to embarrass his choice. The party suffers under the disadvantage of the want of official experience which naturally results from twenty years

of exclusion from office. Mr. BAYARD and Mr. THURMAN would probably be efficient members of the Cabinet, and the claims of New York and of any other Northern State which supports the Democratic candidate must be respectfully considered. The impending "campaign," as the canvass is designated in the political dialect of the United States, will for the next four or five months furnish a large part of the community with pleasant and harmless excitement. It is only by the use of strong language that orators and journalists can disguise from those whom they address their own well-founded conviction that the choice to be made will in no material degree affect the interests of the Republic. It is almost surprising that even a pretence of anxiety can be sustained during so long an interval; but Americans have unbounded energy and volubility, and the people wishes, not, according to the adage, to be deceived by its leaders, but to pretend to be deceived, as a reader willingly surrenders himself to the illusions of fiction.

THE SENATE AND THE AMNESTY.

THE French Senate finds itself confronted by a highly inconvenient dilemma. The Amnesty Bill sent up by the Chamber of Deputies is before it, and it has to determine how to deal with it. If the Senate followed its own preferences in the matter, there would be no doubt as to the conclusion it would arrive at. The dilemma would immediately become no dilemma at all, and the Amnesty Bill would be promptly rejected. But the question cannot be disposed of in this easy fashion, since, if the wishes of the legislators were the only thing to be consulted, the Chamber of Deputies would have thrown out the Amnesty Bill as readily as the Senate. It seems to be perfectly understood that the Chamber has voted for the Bill, not because the Deputies wished the Communists to be amnestied, but because they disliked the possible consequences to themselves of refusing to amnesty them. Before a Republican can vote against M. GAMBETTA, he must have something more than the courage of his opinions. He must be content to abandon political life. More than this, he must have parted company with the Republic of the future, unless indeed he is prepared to welcome it in the person of M. CLÉMENCEAU. There was a time when it seemed doubtful what kind of a Republic M. GAMBETTA might design to set up; but it has never been doubtful that the Republic conceived by him, whatever its character might be, would be the next Republic set up in France. The Republic of M. THIERS was a different affair altogether. It rested on different ideas, it appealed to different classes, it had a different estimate of the past, and a different theory of the future. But the Republic of M. THIERS was ruined by the timidity of its friends and the wrongheadedness of its enemies. Since the 16th of May, at all events, it has never had a chance. M. GRÉVY, M. WADDINGTON, M. DE FREYCINET have been really the pioneers of a new Republic, the Republic of M. GAMBETTA. For the time none other seems possible in France, and moderate Republicans who adhere to it may be excused if they can see no alternative except a Republic which would be still more unlike the kind of Government that they in their hearts wish to live under. Looking at matters in this way, how is a Republican Senator to vote against the amnesty? He cannot plead that he does not know what M. GAMBETTA's opinion on the question is; that, as President of the Chamber of Deputies, M. GAMBETTA has no opportunity of making it public; and that no one is bound to be privy to his relations with a particular newspaper. M. GAMBETTA has made an opportunity of telling the Chamber of Deputies what he thinks about the amnesty; and, after his speech on the 21st of last month, to vote against it is to break away from him in the most unmistakable manner possible.

There are Senators, however, who, though they are not in the least inclined to support a measure simply because M. GAMBETTA supports it, may yet be in doubt what to do with regard to the Amnesty Bill. They are survivors of the Republic of M. THIERS, or else they are men who from convictions or antecedents find it impossible to work with M. GAMBETTA, and so are inclined to see whether the chapter of accidents may not have some unexpected reverse in keeping for him. Yet it is not a matter of course even for men like M. DUFAURE or M. JULES SIMON to vote against the Amnesty Bill. To begin with, they have already voted against the 7th Clause, and thereby drawn largely on the amount of unpopularity which it is prudent for the Senate to incur. In the next place, voting against the Amnesty Bill will be a far more serious offence than voting against the 7th Clause. There was no personal risk involved in the latter proceeding; there may be some personal risk involved in the former. The Extreme Republicans, the men who are always ready to urge the Moderate Republicans into violent measures, and sometimes ready to resort to violent measures on their own account, did not care about the 7th Clause. They thought it a worthless compromise, and held the politician who thought that the Clerical question would be disposed of if members of religious orders were excluded from schools to be little better than a Clerical himself. But these same men do care, and care a great deal, about the amnesty. They want to have the Commune, and the methods of action employed by the Commune, whitewashed; and many of them may have a personal interest—an interest depending on kindred or friendship—in the release from prison or the return from exile of particular Communists. Consequently, to vote against the amnesty will make a Senator unpopular in another and more serious sense than that in which voting against the 7th Clause made him unpopular. On the whole, indeed, the Senate may be said to have profited by its rejection of that clause. The difficulties the Government may get into by enforcing the decrees against the religious orders—and it is too soon to say that these difficulties will not be considerable—will be so many testimonies to the superior wisdom of the Senate. Consequently, it has bought its independence cheap. But the rejection of the amnesty may be a far more serious business. The Senate had the advantage in the former case of being in a position to give the Government a polite snub, and nothing more. M. DE FREYCINET had it in his power to carry out without consulting the Senate a more stringent form of the policy to which the Senate had refused its assent. He had to ask leave to expel religious orders from schools, but he was able without asking leave to expel religious orders from their own dwellings. But if the Senate rejects the Amnesty Bill, M. DE FREYCINET will to all appearance be powerless. There are no obsolete laws—at least none have yet been discovered—which enable him to restore Communists to their civil rights. Yet the hopes which will have been excited by the acceptance of the Amnesty Bill by the Chamber of Deputies are not of a kind which can disappear without something more being heard of them. Nor is M. GAMBETTA exactly the man who, after he has gone out of his way to associate himself with the amnesty, will easily put up with its rejection by a Chamber to which he has no special love. Thus the Conservative Republicans in the Senate may be moved to offer no active assistance to the Bill by higher considerations than those of mere personal convenience. What if the rejection of the Amnesty Bill should involve the abolition of the Senate? The Right will be quite indifferent to this possibility, for their nominal Conservatism does not make them at all more friendly to the existing Constitution than if they belonged to the Irreconcilable Left. But there are some real Conservatives in the Senate, men who wish to see the existing Constitution maintained and amended, not replaced by a new Constitution of a less Conservative type. To these the abolition of a Second Chamber, which the Right might welcome as merely a prelude to a new falling out among Republicans, amid which honest Royalists might hope to come by their own, would be a cause of genuine regret. If to allow the Amnesty Bill to pass is the only way of avoiding this catastrophe, they may think it best to abstain from voting against it.

On the other hand, what is the use of a Second Chamber which gives way to pressure the moment that it becomes serious? The answer to this is that Second Chambers are not designed to be absolutely rigid. In modern Constitutions the popular Chamber is the wilful man that must have his way; the Second Chamber is the wife who has often the power of preventing him from becoming wilful. The French Senate can hardly hope to exert greater power than the English House of Lords, and the English House of Lords has retained its power by judiciously abstaining from exerting it in cases where the popular will is clearly ascertained. As regards the amnesty this condition is plainly satisfied. For present purposes in France M. GAMBETTA is the popular will. He would not have exchanged the President's chair for the tribune unless he had convinced himself that he had the nation—the available and political nation, that is

to say—at his back. It will be a further reason probably with the Senate for not rejecting the Bill that, except in so far as it destroys any reputation that Ministers may have previously had for independence or consistency, it will not much matter that there are a few more Communists in France. There is no danger at present of another Communist outbreak. Whether, when opportunism in the person of M. GAMBETTA is plainly at the head of affairs, this will be equally true is another matter; but for the present the Extreme Left find the Government fairly pliable, and so are not tempted to resort to violent measures in order to get what they want. If the appeal to force should be again made, experience has shown that France is strong enough to put down revolution when she has the mind, and she is not likely to lose this faculty under M. GAMBETTA. There are other considerations which make the wisdom of granting a plenary amnesty exceedingly doubtful, but they are derived rather from the effect which the concession is likely to have on the friends of order than from any stimulus which it will give to revolutionary enterprises. With all this in their minds the Senate may perhaps content itself with leaving ordinary criminals to work out their sentences. A Second Chamber can hardly be abolished for refusing to see that murder and robbery cease to be objectionable when they happen to have been committed in a time of political excitement.

SUNDAY CLOSING.

If the Government hoped that the announcement of their intention to deal with the whole subject of the licensing laws would have the effect of checking rash resolutions on the part of the House of Commons, they have been disappointed. The only result of the information has been to lessen the very slight sense of responsibility that the House possessed. When the Government are going to legislate upon a large question like the liquor traffic, to vote for impracticable resolutions or impracticable Bills, which only propose to touch the fringe of it, becomes the safest of amusements. The Government may be trusted not to let the bread be permanently taken out of their mouths. If a resolution is adopted, they will delay acting upon it until they have had time to consider it in the light of their own measure. If a Bill is read a second time, they will take care that in the Lords, if not in the Commons, it makes shipwreck on those unavoidable delays which are so many thorns in the flesh to ambitious private members. Consequently, every one who thinks he has discovered a sovereign remedy for the hitherto irrepressible tendency of man to drink when he is thirsty, and sometimes when he is not, now sees his opportunity before him. He can approach a wavering supporter with that best of arguments, that nothing will come of it, and thereupon the wavering supporter remembers that some of his constituents will certainly be pleased if he consents, while those of them who are displeased will, equally with himself, draw consolation from the fact that the vote is purely formal. It is in this temper that the new House of Commons has successively dealt with Local Option and with Sunday Closing. Sir WILFRID LAWSON'S Resolution, Mr. PEASE'S Resolution, and Mr. ROBERTS'S Bill have alike been accepted; and the majority of those who either voted for them, or contributed to their adoption by staying away, are probably now cheering themselves by the reflection that nothing more will be heard of any of them for this Session.

The Sabbath, said Mr. PEASE, in a spirit of toleration which he was unable long to maintain, was made for man. It soon appeared that what Mr. PEASE meant was that the Sabbath was made for metropolitan man; for man, that is, when he is strong enough to resent to some purpose the doctrine that man was made for the Sabbath. Mr. PEASE'S wish is evidently to make Londoners spend their Sunday in London. If they go out into the country, they must either come back hungry and thirsty, or else get their wants supplied by presenting themselves to the publican in that most unpleasing and disingenuous of characters, the *bonâ fide* traveller. The only place where a man will be able to get a glass of beer without subjecting himself to cross-examination, or feeling that he is conniving at an evasion of the law, is the Metropolitan district. If Mr. PEASE is of opinion that the thousands of young men who have no homes to go to will be the better for being kept in London, by the difficulty of getting food and drink if they go out of it, he must have formed a higher estimate of metropolitan morality than the result is likely to bear out. People who legislate on the drink question are apt to shut their eyes to obvious truths; but it might have been thought that the bicyclist was too obvious a truth even for a friend of temperance to shut his eyes to. For thirty miles round London and every other great town the Sunday bicyclist is to be met everywhere. He is not loved by those whose business lies with horses; but, if he occasionally brings a rider or driver to grief, he does a great deal of good to himself, and he belongs to a class which is too numerous to be properly left unconsidered. Will sobriety be promoted if the bicyclist is encouraged to remain at home on the only day when he can travel any considerable distance? Mr. PEASE will, no doubt, reply that the bicyclist is a *bonâ fide* traveller. But, if the term is to be taken to include him, one of the main reasons for Sunday closing will become inoperative. How is the publican to enjoy his day of rest if he is to be always opening his door to *bonâ fide* travellers taking their weekly outing on a bicycle? It would be less trouble to him to keep it open altogether. Of the two, even Mr. STEVENSON'S proposal is preferable to Mr. PEASE'S. Impartial tyranny is less irritating than tyranny which is suspended when resistance is expected. There can be little doubt that one of the motives which make Mr. PEASE so anxious to conciliate the metropolitan public is the fact that the metropolitan public are strong enough to make conciliation necessary. Sir RICHARD CROSS is quite right when he says that, if all the public-houses in London were closed on Sunday, there would be the greatest possible difficulty in keeping the peace. In other words, men must be allowed to drink when they are numerous enough to make a riot if they are debarred from drinking. When they are too few to make their dislike of Sunday closing serious, their wishes may be disregarded. This may be prudent legislation, but it is certainly not heroic; the pleasure of putting an end to other people's enjoyment seldom is.

When Sir RICHARD CROSS assumed that, if public opinion were in favour of closing public-houses on Sunday, not a single member would wish to keep them open, he may have known those on whose behalf he spoke. In that case we must be pardoned if we take the tone of the Pharisee, and rejoice that we are not as members of Parliament are. There is a sense of course in which Sir RICHARD CROSS'S statement is perfectly harmless. If by public opinion being in favour of Sunday closing he meant a state of things in which no one wished to go to a public-house on Sunday, the public-houses might certainly be closed. In that case, however, the motive for closing them would be wanting, and the zeal displayed for closing them would die out. It is not the empty public-house that it is wished to close, but the full one; and when public opinion is spoken of as being in favour of Sunday closing, what is meant is the opinion of the class which does not go to public-houses, or of the class which goes to them too often, and would like in its rare intervals of uncomfortable sobriety to have the opportunity of getting drunk withheld from it. Neither of these classes has any right to be specially listened to on the subject. The people whose opinion is really important are that large class who go to a public-house either for society or for refreshment. Working-men go there mainly for the former object; young men of the middle classes go there principally for the latter. Both objects are in themselves perfectly legitimate, and both are entirely ignored by the temperance fanatics. Has the opinion of the men to whom the public-house serves for a club, or of the men to whom it serves for an hotel, even been asked on the point? That is the real question to which an answer is wanted. It is nothing to the purpose that all the householders in a town have signed petitions in favour of Sunday closing, if the people who go to public-houses on Sunday are not householders. This is not a subject upon which the opinion of the majority is entitled to any weight. The persons to be consulted are the few who want to go to public-houses, not the many who are content to stay away. Unfortunately the opinion of this minority is not very easily got at. Many men would be very sorry to be debarred from getting a glass of beer when they are out for a Sunday walk, who might not like their names to appear on a petition against Sunday closing. They do not wish to be regarded as worse than the habitual toper,

inasmuch as he is at least anxious to be put out of temptation's way, while they are only anxious to remain within reach of it. As regards Wales, the fact that twenty-nine out of its thirty members supported Mr. ROBERTS's Bill made it impossible for those who had supported a similar measure for Scotland and Ireland to offer any opposition to its passing. If a majority of Scotchmen and Irishmen are to be allowed to dictate to a minority of their fellows what, where, and when they shall drink, how is a similar concession to be denied to a majority of Welshmen? The mistake lay in passing either the Scotch Act or the Irish Act. The Imperial Parliament can have no more deserving clients than the oppressed remnants of the three nationalities; and, though Sunday closing may not be a form of oppression that raises any special outcry, its victims are none the less oppressed. It was not to be expected that this view should find expression in the present House of Commons when it failed to gain attention even in the last. While the Irish Bill was under discussion both parties committed themselves to the mischievous theory that A. and B., who do not want to go to public-houses, may rightly shut them against C., who does want to go to them, and this without any regard to the purpose which C. has in view. The total-abstainers are a great deal too clever not to make full use of this blunder. Men who are ready to forego their principles in order to secure votes must not expect to be let off with a single act of surrender.

THE SUNDAY SCHOOL CENTENARY.

THE centenary which is being celebrated to-day by the somewhat hazardous experiment of a gathering of twenty thousand Sunday school children in the gardens of the Archiepiscopal Palace of Lambeth may fairly be considered what the *Times* is pleased to call "an event of epochal character." A century is a considerable period even in the life of a nation, and it is natural to ask ourselves on such an occasion as this what a century of Sunday schools has done for us? Not that it is quite correct to speak of the system as originating in the philanthropic efforts of Robert Raikes of Gloucester in 1780. Something of the kind is said to have been established at Milan by St. Charles Borromeo three centuries ago, and his name is accordingly, it seems, to stand first on the memorial column erected in memory of the present celebration. Many of our readers may have witnessed the striking spectacle, to which the Archbishop of Canterbury referred the other day in his speech at Guildhall, and which may still be observed every Sunday afternoon in the nave of the Duomo at Milan, of a vast assemblage of children in various groups receiving catechetical instruction. In fact the idea of this method of instruction sprang up, not in the eighteenth century but in the sixteenth, and in both of the great divisions into which Christendom was rent by the Reformation. We have spoken already of Carlo Borromeo, who is generally credited with the composition of what is called the Tridentine Catechism, but is in fact a manual of instruction in the Creed, Decalogue, Lord's Prayer, and Sacraments, ordered to be drawn up by the Council of Trent, but not published till a year or two after the Council was dissolved, and following much the same general lines as the Catechism in the English Prayer-book, though at much greater length and of course with many differences of detail. The latter was from the first ordered to be publicly taught in church on Sunday afternoons. In the rubrics of 1549 and 1552 the curate of every parish was directed "upon Sundays and holy days half an hour before even-song"—altered in 1662 to "after the Second Lesson at evening prayer"—"openly in the church to instruct and examine the children of his parish in some part of the Catechism." How far this injunction was carried out at the time we are unable to say, but it had certainly become a dead letter for a long time when the early Tractarians began to revive the practice of catechizing, instead of preaching, on Sunday afternoons, chiefly on grounds of rubrical correctness. In the present day the custom of afternoon catechizing in church has been very widely adopted in town churches, where there are usually both afternoon and evening services, from its obvious practical convenience. Some clergymen indeed, whose names are well known, have acquired an exceptional reputation for their skill in what is popularly supposed to be one of the easiest, but is really one of the most difficult, duties to discharge efficiently. And its importance has undoubtedly been much increased by the impediments to religious instruction on week-days even in voluntary schools, and still more in Board Schools, created by recent legislation. But while it cannot be said that the idea of utilizing Sunday for this purpose had no existence before the time of Raikes, either in England or elsewhere, and still less that the Church of England had neglected, as far as authoritative enactments went, to make careful provision for it, there can be little doubt that nothing of the kind was being actually carried out at the time he began his benevolent crusade against juvenile ignorance and vice at Gloucester. The scheme of organizing Sunday school instruction by the appointment of a regular staff of paid teachers was his, but during the thirty years intervening between the commencement of his work and his death in 1811 an important and on the whole beneficial change had been introduced—at the suggestion, it is said, of a Wesleyan—by the substitution of unpaid for paid teachers. And this arrangement, which, as we shall see presently, is not wholly without its drawbacks, has been not unjustly termed "the keystone of the modern Sunday school system."

To appreciate aright the significance of the movement originated in 1780 we must remember that the state both of national education and national religion was then at its lowest ebb. The "*sæculum rationalisticum*" was drawing to its close; religious scepticism and indifferentism were advancing quietly, but surely, *pari passu*, and their advance was accelerated, as Mr. Lecky points out, by "the selfishness, the corruption, the worship of expediency, the scepticism as to all higher motives that characterized the politicians" of the day, and "the heartless cynicism reigning in fashionable life." The influence of the Church was declining; Convocation had been silenced; the Trinitarian controversy was thought to have weakened orthodox belief; the neglect of Sunday observance was publicly denounced as habitual and notorious; zeal had waxed cold even among the most prominent churchmen, and it was the common taunt of her enemies and lamentation of her friends that "the Church was dying of dignity." Nor did education fare much better than religion. "The Universities," to cite Mr. Lecky's testimony once more, "had fallen into great moral and intellectual decrepitude." The public schools were more noted for the bullying than for the learning fostered within their walls. The endowments of the Grammar schools had too often been plundered or perverted to other purposes; some idea of their condition then may be gathered from a case within our own memory of the clerical master of one of these institutions who, having a taste for music and none for teaching, deliberately emptied his school and devoted his ill-won leisure to playing on the violin. Of "primary education," as it is now called, there was no conception; neither name nor thing existed. And of the amount and kind of religious education usually imparted to the upper classes some notion may be inferred from a well-known story told at a much later date of the famous Dr. Keats, Headmaster of Eton, and preserved in Mr. Maxwell Lyte's interesting history of the School. It had not been the custom to give any religious instruction at all at Eton except in the shape of sermons in Chapel; and Latin verses used to be done on Sunday. Some friend however suggested to Dr. Keats the propriety of giving his sixth form a Greek Testament lesson. He adopted the suggestion and naturally began with the Gospel of St. Matthew, which the boys construed quietly through without any comment till they reached the Beatitudes in the fifth chapter. Then it first occurred to the doctor that the occasion for what preachers call "a practical application of the subject" had arrived, and he observed on the sixth Beatitude, "You see, boys, you are bound to be pure in heart, *and if you are not, I shall flog you.*" Dr. Keats's flagellations were known to be no joke, and we may hope the exhortation took due effect. But when this was the level of religious instruction for the *alumni* of Eton, it was not likely that much attention would be bestowed on the teaching of the poor, and we are not surprised to find Lord Mahon saying that "throughout England the education of the labouring classes was most grievously neglected," and that among the principal means tending to foster a better spirit in the coming age was the institution of Sunday schools. Raikes formed at first a very moderate estimate of his own work, and said the attempt was at least a harmless one, and was intended to check the deplorable profanation of the Sabbath. He began with twenty children at Gloucester; there are reported now to be four millions and a half in the Sunday schools of the United Kingdom.

But while the movement set on foot by Raikes was a most praiseworthy and has proved on the whole a very beneficial one, it would be worse than idle to deny that there are some very serious drawbacks to its efficiency and success. It is abundantly possible to give children too much schooling as well as too much Church on Sunday, and they have very often been oppressed with a great deal too much of both. An hour or two of Sunday school succeeded by a two hours' service, probably ending with a sermon entirely beyond their comprehension, is more than any children can be expected to endure with patience, certainly more than any child will undergo with profit. Shorter services, specially arranged for children, with plenty of singing and a discourse neither too long nor too learned to secure their attention, offer one solution of the difficulty. Our present business however is not so much to provide remedies as to point out defects. One of these defects has unquestionably arisen from that very employment of unpaid teachers which is said to be the keystone of the entire system. Unpaid teachers, unless they are carefully organized and trained, are very apt to be incompetent ones, and the popular delusion that anybody is fit to teach children, combined with the particular delusion of many excellent but entirely inefficient or superficial persons, of both sexes, that they are themselves exceptionally competent for the task, has helped on this undesirable consummation. There are many well authenticated stories afloat intended to illustrate the stupidity of school-children—as of the girl who, on being asked what she meant by her "ghostly enemy," replied, after due meditation, "Please, ma'am, the Holy Ghost." But most of these stories really reflect quite as much on the capacities of the teacher as of the taught. Mr. Stephen Gladstone, the Rector of Hawarden, who appears on this occasion to have assumed the office of *advocatus diaboli*, put some aspects of the adverse side of the question strongly, but hardly too strongly, in his comments on Church of England

Sunday schools the other day at a meeting of the Rural Deanery of Mold:—

He said he believed no good institution was so enormously overpraised as the present school system. He believed it did not deserve one-hundredth part of the praise which it freely bestowed upon itself and which an ignorant world of admirers re-echoed. The means for attaining their objects were so utterly inadequate that some clergymen refused to have anything to do with a system which looked so hollow and rotten. Had they never heard Sunday schools turned into bear-gardens before or after school? Schools were often hindered, if not entirely upset, by the presence of one or two virtuous, but utterly inefficient teachers, who fidgeted about, who took out their reward in gossiping, in levity of conduct, and in the mischievous folly of smart dressing. There was something, too, of bribery and corruption by means of undeserved treats and prizes to secure the children's attendance and the admission of all comers, even deserters from other schools. He urged them to make the centenary a time of radical reform.

To this parting advice at all events no one can reasonably object, and as Sunday Schools were in their origin quite as much a Dissenting as an Anglican institution, we are inclined to think that some useful hints for reform might be gained by the clergy from an examination of Dissenting methods of working it. In towns Nonconformist Sunday schools are often the most efficient and most largely attended, and we suspect this is due in great measure to a better organisation of the teaching stuff, especially of male teachers, whose ranks are generally the most difficult to recruit. It may be added that, to judge from the average result, the instruction given in Sunday schools must have been of a very desultory and inadequate kind. It has been lately asked what proportion of those now under Sunday instruction will grow up into regular attendants at Church. But we may first ask what proportion has so grown up during the century these schools have been in operation, and moreover what has been during that period the average standard of religious knowledge and practice among the classes who have been subjected in childhood to this method of training. The answer to both questions, we fear, would prove very far indeed from satisfactory. The "epochal character" of the present celebration may perhaps be sufficiently justified by reference to "the blessings vouchsafed to Sunday schools during the past hundred years," recorded in the resolution moved the other day by the Archbishop of Canterbury at the Guildhall, but there is at least equal need to justify it by seizing the opportunity as a starting-point for future reform.

MR. GLADSTONE AND MR. BRADLAUGH.

THERE is no more fascinating branch of historical biography than the inquiry into the origin and progress of the friendships of great men. To trace the circumstances which first established intercourse and fellow-feeling, to watch the progress and cementing of the companionship—these are occupations worthy of all those who hold with the great saying of the poet as to the proper study of mankind. Specially interesting at the present moment, perhaps, is the investigation of the circumstances that first brought together the distinguished names which are now coupled on the lips of men and at the head of this article; and a tractate *De Amicitiâ* with this special bearing seems well worth the doing. It has been commonly, but unphilosophically, supposed that the conjunction is a sudden and a new one; that it was not till certain recent events necessitated the driving of all fish into the Liberal net that Mr. Gladstone lifted up his eyes and loved Mr. Bradlaugh with that love which—but the conclusion of the quotation is ill-omened, and we will not finish it. This supposition is, as we have said, unphilosophical; in this case it is unhistorical to boot. "Nine years have risen and eight years set," as Mr. Swinburne's charming verses have it, since Mr. Gladstone—with measured and conditional approval, it is true—gave Mr. Bradlaugh a status and a local habitation in politics. Before that time the name of this person, or his pseudonym of "Iconoclast," had indeed been known to the inquisitive. But his merits and his political position had not yet been assured by the approval of persons who seemed to speak with authority. There was indeed a floating idea—Mr. Bradlaugh will pardon us for mentioning what is merely an historical fact—that he came under the general head of those miscellaneous politicians who were once described by the wicked wits of the *Anti-Jacobin* as "all creeping creatures, venomous and low"—people were shockingly rude in those days, and the parody, though quite in Mr. Bradlaugh's own style, was objectionable enough. But in the autumn of 1871 Mr. Gladstone made one of his famous Blackheath speeches. There were as yet no mild Bulgarians to bewail or to cheer on to emulation of their masters—Batak had not yet excited Mr. Gladstone, nor had Kirdjali failed to excite him. So he talked about things now long forgotten, about proposals to give every artisan an estate in the country, and so forth; and he made his unforgotten remark about thinking once and twice and thrice in reference to the Lords Temporal of Great Britain. In the course of this speech Mr. Gladstone recited from "a questionable book" words which "contained much good sense," and those words were a dull parody on "God Save the Queen," in which "the people" were entreated to "save themselves." Curiosity was of course at once excited as to this new fount of sense, and it was discovered to be the *Secularist's Manual*, a work of prose and verse, prefaced with a warm commendation by Charles Bradlaugh. A good deal of the contents of this new book of golden sentences was simply, as it appeared to the impartial reader, foolish. Take, for instance, this touching formula of dismissal for a secularist congregation:—

Farewell! dear friends, adieu! adieu!
Till we again unite.
The social system keep in view,
Farewell! dear friends, good-night.

It strikes one here that the enlightened secularist poet can hardly be acquainted with the French language or he surely would not employ the word "adieu." Nor probably has there been a more remarkable expression of inspiriting sentiment than "The social system keep in view," since Mr. Pecksniff took a captain's biscuit and said "Let us be merry." The *Secularist's Manual*, however, by no means confined itself to these harmless follies, or to making "goes" rhyme to "clothes." When Mr. Gladstone commended the good sense of its words, it contained a blasphemous parody of the doxology, which seems to have disappeared from its latest editions. It still includes some spirited appeals to "base oppressors" —*i.e.* English landlords and employers—to "leave their slumbers"; some remarkable descriptions of the millennium, "when competition's woes shall cease"; the Republican balderdash which Mr. Gladstone quoted with approval, and an elegant poem, of which the first verse will probably suffice:—

What book is filled with tales so wild
That you would scarce believe a child
To think them true could be beguiled?
The Bible.

This and a great deal more like it is the stuff which Mr. Gladstone thought questionable, but full of good sense, and it is needless to say that his recommendation, in familiar phrase, made a man of Mr. Bradlaugh. We do not know how often the souls whose kindred was thus strikingly indicated met between 1871 and 1880, or whether "Iconoclast" has made hay—a congenial operation —under the doomed oaks of Hawarden or not. But it is worth pointing out that the *Secularist's Manual* evidently made no small impression on its distinguished reader. The famous three thoughts about —not the Upper House, as they are generally quoted, but—the expulsion of the hereditary principle from that House, were clearly suggested by the Secularist programme contained in the questionable but sensible work which advocates "the destruction of the hereditary House of Peers and the substitution of a Senate of life members." "Here's pansies for you," Mr. Bradlaugh had said to Mr. Gladstone, and the union of the elect souls was begun.

We must hasten over the interval of nine years just referred to. It is sufficient to say that an unaccountable reluctance appeared for many years to be felt by the Liberal candidates for Northampton to associate themselves with Mr. Gladstone's friend and teacher. At last, in the spring of the present year, when Mr. Gladstone's party at last "made their effort," an appropriate yoke-fellow was found, and, with the aid of Mr. Adam, the official manager of the party, and Mr. Morley, a distinguished member of it, Mr. Bradlaugh was sent to Parliament to enforce the doctrines of the *Secularist's Manual*. We are not aware that Mr. Gladstone contributed his endorsement to the back of the bill; but at that time Mr. Gladstone was, as every one—and the Emperor of Austria in particular—knows, merely a private person, occupied in deliverances of a polemical character. Mr. Adam, however (unrebuked, as far as we have seen, by the Presbytery of Clackmannan), and Mr. Morley—whose conscience had for the time been quieted by the Evil One, and by the aid of that invention of the Evil One, the electric telegraph—seated their man, or rather returned him. Mr. Adam is still impenitent; Mr. Morley has very publicly made the *amende honorable* to the Divinity he accidentally forgot. It is true that this *amende* is not quite complete, for we observed in the first Bradlaugh division the name of Mr. Morley's son on the side of "Iconoclast." It would appear that the House of Morley arranges its ghostly affairs on the prudent plan of those turbulent Scotch Houses who used to go out in the last century. The Morley is on the side of the Deity, the Master of Morley on the side of the other hypothesis; and it is to be hoped that a complete spiritual attainder will in this way be avoided. As for Mr. Gladstone, his part has been endeavoured to be characterized more than once in these columns. His defence of his friend and teacher cannot be called exactly chivalrous, inasmuch as it has been chiefly of the indirect kind, and, until his hand was finally forced, was directed to the acquisition for himself rather of the credit of a defender of religious liberty than of the discredit of a defender of the sensible but questionable views of Mr. Bradlaugh on things, religious and political. The motto of Mr. Gladstone in matters of friendship appears to be that of Mr. Lowten in the romance of *Pickwick*—"We're all very friendly and pleasant, you know, but—hurting yourself for a friend!" If you can assist him in a roundabout way, and at the same time throw the odium of persecution on your political adversaries, why we feel sure that Mr. Lowten would agree that this is legitimate; and this, as it appears, is the course which Mr. Gladstone has actually taken. To do any more he has waited till Mr. Bradlaugh got up an agitation for him, and in an agitation Mr. Gladstone is always at home.

Such is the past and such the present of this interesting *liaison*. We have hinted that the amount of personal intercourse between the friends has in all probability been but small. "However much they like each other," pathetically complained Mr. Pendennis, "men in the London world see each other but seldom." Mr. Bradlaugh works his work, Mr. Gladstone his; and though both are labouring, and have been labouring, in the same interest—the good of the great Liberal party—their spheres are different. Doubtless, if they had not until lately met

in the flesh, they have both often muttered the exquisite words of Lockhart's ballad, "Some day more kind I fate shall find, some night kiss thee." But that day has now come, and when the trifling obstacles of form are done away or borne down by the weight of a Government majority the full union will be easy. Mr. Bradlaugh (it is interesting to know it on his own authority as reported) is going to devote his earliest energies to the abolition of the Duke of Marlborough's pension, as a requital for Lord Randolph Churchill's action against him. The eminent "Iconoclast" is of course not tied to narrow Christian views of morality, and is quite at liberty to act in the natural Iroquois manner. His action cannot fail further to endear him to Mr. Gladstone both as an economist and as a good hater, though we fear that Mr. Gladstone himself is hardly yet educated up to the heroic height of adopting his friend's proposal. His own retaliations have rarely been of this direct fashion, and the connexion of the University election of 1865 and the Irish Church resolutions a year or two later had, as we know, the important middle term of the Manchester murder. If Mr. Bradlaugh is wise, he will take a hint even from his pupil. Still the two great men agree in the general spirit of their characters, which agreement, flavoured by some minor and unimportant differences—such as that about the Bible, for instance—is universally recognized as the soundest basis of friendship. They both in particular proceed upon the principle which the present American Minister has expressed in words of which we are happy to give the right reading for the first time:—

> They are slaves who will not use
> Insult, scoffing, and abuse,
> Rather than in silence shrink
> From the truth we please to think;
> They are slaves who dare not be
> In the right with you and me.

If Mr. Lowell does not recognize this, we apologize; but it is, we repeat, clearly the right reading, and expresses Mr. Bradlaugh and Mr. Gladstone with incomparable precision. We cannot attempt to prophesy (because we don't know) what the future of their friendship may be. In the course of nature it is to be feared that Mr. Bradlaugh must survive his pupil, unusual as such a survival seems to be. Perhaps he may himself come to fill Mr. Gladstone's place, a consummation for which England will be doubtless, not devoutly—that is an inappropriate word—but intensely thankful. Perhaps, too, age may mellow the somewhat acrid virtues of "Iconoclast." It is even possible, in the vista of the rolling years, to see Mr. Bradlaugh mildly speaking of some audacious innovator—say a preacher of Christian morality and unlimited population—as a "questionable," but "sensible," person, from whom a good deal may be learnt. History, we know, is always repeating itself. At any rate it should always be remembered that Mr. Gladstone has the best of all rights to champion the elect of Northampton, in virtue of the graceful encouragement given when he was yet but one of those who "lecture as they go"—it is astonishing how the *Anti-Jacobin* occurs to one in this connexion—and when Mr. Gladstone was (as he is now) Premier of England, chief Minister of the Sovereign whom Mr. Bradlaugh regards so loyally, and a shining member of the Church of which Mr. Bradlaugh is so affectionate and dutiful a son.

SOCIAL CATECHISTS.

THOSE are not the most agreeable companions whose conversation chiefly consists of interrogatories. Yet many people would be very silent if they did not largely pad their small talk with questions. If we analyse the short chatterings which are constantly going on in the streets, in the clubs, and in society, we shall find that a great proportion of them consist of remarks about the weather and questions. Neither meteorological nor inquisitorial conversation is particularly enlivening, but we readily admit that society would not get on very well without them. The wisest of us are sometimes at a terrible loss for something to say, and we have had occasion to wish that society would agree upon some commonplace remark which might be made at any time when it seems desirable to speak and there is nothing to be said. Mohammedans have a great advantage over us in this respect. Not only have they their pious stock observations ready for use whenever it is fitting to speak, but they maintain a dignified silence between times. There are certain monastic orders, again, who have one invariable remark for use whenever any of the members meet in their convents; and, better still, this remark has but one regular rejoinder. It may not be exactly inspiriting to have the words "Dust thou art, and unto dust thou shalt return," constantly reiterated when meeting one's companions; but, of the two, we think it would be less wearisome than the perpetual "Are you going on anywhere?" which one hears at evening parties, and other remarks of the same type.

There are two kinds of questioners who torment one in society. One is the being with a preternaturally inquiring mind, the sort of creature who is never happy without knowing the when and wherefore of everything; the other is the person who asks questions without caring an iota to hear the answers. It is hard to say which of these two kinds of catechists is the greater bore. There is little satisfaction in being tormented with such questions as, "Can you tell me who the lady is that is sitting next but one to the man who is leaning on the piano?" or "There is a man with a light moustache by that lady in blue. Can you tell me who he is? You can't see him now, he is behind that tall man. There, now you see him! No, not the man with the eyeglass." It is wearisome, too, when people pester one for authoritative information as to the doings of one's friends, after this fashion:—"Tell me, is there any truth in the rumour that Howard Jones is going to buy the —— property?" or "I want to know whether Lord A. is *really* going to marry Miss B.?" The most irritating of all cross-examiners of this kind are those who ask what things cost. It is popularly supposed that in good society such questions are never asked; but there are, unfortunately, too many exceptions to this rule. There are men who want to know whether this or that is very expensive, whether they could get such a thing for about a hundred pounds, or perhaps they "suppose that a picture like that would cost quite a thousand pounds, wouldn't it?" When they come to see you, they inquire what sort of rents houses are let for in your part of London, and they consider your champagne better than some which they lately purchased at ninety shillings per dozen—"Probably yours cost more?" There is no limit to the inquisitiveness of some people. They want to know the name of your doctor, the address of your tailor, your weight, your height, and your favourite newspaper. It is necessary for their peace of mind that you should tell them where you find your servants, where you buy your bread, and where you go to church. They must know whether you smoke before going to bed, whether you tip railway servants, and whether you ever chastise your children. The catechists who do not listen to your replies are not much pleasanter companions. Do we not know for a certainty when we see some people approaching that they will ask us how our father and mother and brother are, without caring a straw about the answer? They go off like machines. We know that, when we shake hands with them, we might as well be pulling the spring of a mechanical toy. They will smile and bow and say, "I hope you are very well; and how is your wife, and how is your little boy?" the latter question being asked with a peculiar half-condescending, half-jocular tone of voice, which somehow or other is especially irritating. Ninety-nine out of each of the many hundreds of people who ask each other during the London season how long they have been up, and when they are going down, neither care for nor remember the answer for half a minute.

It is at dinner parties that people are most worried by social catechists. When one has the misfortune to sit at table beside a bore of this kind one's doom is cast for an hour and a half. We are asked if we have been to Ascot, or to the Handel Festival, or whatever may have been the leading fashionable rendezvous of the day. After being put through two or three questions of this kind, we know what is coming, and prepare ourselves for a continued fire of cross-examination. We lately heard a lady ask a gentleman, between the soup and the fish, a few questions of the above type, when he replied politely, but decidedly, in the negative, adding, "and I may as well tell you at once that I have not been to Kensington House, nor to the Assault of Arms, nor to see Modjeska, nor have I read Miss Rhoda Broughton's last novel." The poor man had seen what was coming, and had thought it better, as they say in the City, to discount it. We did not notice the lady asking him any more questions during the subsequent part of the dinner. Many catechizers put their queries from a pure love of swagger. They ask their fellow-guests whether they have seen several things or been at several entertainments until they fail to answer in the affirmative. The examiners then expatiate upon the pleasures and glories which have been missed, and they endeavour to inspire feelings of envy in the examined. If you do not happen to have seen some particular play, you are told that it is the very best to be seen in London at present, if not the best that has been performed on the London stage for some years. Everybody is talking about it, and you really must go and see it, but you will have to secure your stalls three weeks beforehand. Altogether you are made to feel yourself quite out of the world, and almost an inferior being, because you have not seen this wretched play, for which you are likely enough not to care when you do see it. Or perhaps you have not heard the new soprano. Her voice is superb and her acting is perfect. We are tired of the woman's very name in five minutes, but reflect that here is another of those terrible things that must be "done" at any sacrifice, in order to satisfy the exigencies of modern society. We tremble to contemplate the horrors of the catechizings about the Royal Academy which we have so often to undergo during a London season. Perhaps it is best to be able to say that we have not been there, for although we shall then be looked down upon, our torments on the subject will cease at once. If, however, we own that we have seen the Exhibition, we are in for a very disagreeable cross-examination. We shall be asked whether we like a picture by an artist whose very name we have never heard before, and what our opinion is of this, that, or the other picture, of not one of which have we the faintest recollection. Our deplorable ignorance is soon made painfully apparent, for the artistic catechist delights in "cramming up" pictures which the world in general is unlikely to notice. It is not much less disagreeable to be trotted out on the subject of literature. Many men who read a good deal are sometimes floored by a chit of a girl who dabbles a little in books, because she manages to ask them about works which lie outside their line of reading. They have never perhaps heard of books of which she knows little but the titles, but, with womanlike skill, she contrives to wave them like red flags before their eyes. They may be deeply-read scholars, and yet they would shrink from talking about books which

they had but half studied; but no such false delicacy deters the chattering female. She will talk freely about a book which she has but dipped into for five minutes while waiting for a friend to put a bonnet on; and if she finds that she is getting out of her depth, or that her interlocutor is better versed than herself in the question under discussion, she adroitly changes the subject, and thus emerges from the conflict unscathed. A very favourite method of examination pursued by some ladies is to cross-question their companions at dinner as to their tastes. They inquire whether they are fond of music, and having satisfied themselves on that point, they ask whether they are fond of dancing, riding, shooting, racing, polo, or Alpine climbing.

There are many admirable little devotional books containing lists of questions for self-examination, and we sometimes think that it might be a good thing if some philanthropist would compile a social handbook on the same model for use while dressing for dinner-parties. It might contain such questions as the following:—Have I been to the Dutch play? Have I read Prince Metternich's Memoirs? Did I go to the State ball? Do I admire the new beauty? After a deliberate self-searching of this kind, one might go into society with some degree of confidence. But even this crucial self-examination would not prepare one for what we consider the most objectionable of all social catechisms—namely, questions as to whom we know. One would expect well-bred or well-educated people to scorn the snobbish trick of asking strangers whom they know, with the view of ascertaining whether their acquaintance is worth cultivating; but such is not the case. It may be a weakness on our part, but we own that few things make us more angry than to be asked whether we know Lord this or the Duke of that.

We are fully aware that there can be no conversation without a certain amount of question and answer; but we would rather stand up and repeat our "desire" or our "duty towards our neighbour," and have done with it, than submit to the catechizing which is too often inflicted upon us at London dinner parties. If people have nothing to talk about, we promise not to quarrel with them for being silent; but we protest strongly against their trying to pass off a string of inane questions as conversation.

DISESTABLISHMENT AT GENEVA.

IT is curious that the English newspapers should have contributed nothing fuller than very curt telegrams towards the elucidation of the exciting question which is at present occupying the citizens of Geneva. The separation of Church and State—or, to speak more precisely, of the two Established Churches and the State—has been the one absorbing topic of debate in the late session of the Grand Council. Geneva is the first of the Swiss cantons which has ventured to give a moment's tolerance to the Liberationist solution of this difficult and dangerous problem. The Republic of Geneva, before its reception into the Swiss Confederation in 1815, was probably the most Protestant State in the whole world. It was proud of its traditions as "the Rome of Protestantism," though it had long ceased to hold the international significance which belonged to it during the lives of Calvin and Beza, when it was the one sacred Œcumenical court of appeal upon earth to Puritan Englishmen, to Presbyterian Scots, to Huguenot Frenchmen, and, in a less degree, to all the "Reformed" or non-Lutheran Churches of Germany. At the time of the reception of Geneva as a member of the Swiss Federal League, Catholic Nonconformity was little more than tolerated. Article I. of the "Constitution pour la Ville et République de Genève," which was then in force, contained the clause: "Quoique la Religion Protestante soit dominante dans la République de Genève, il y aura dans Genève une église ou une chapelle destinée au Culte Catholique." In this solitary chapel we perceive the germ of that concurrent endowment of a Protestant and a Catholic Establishment which is at present the rule in the canton. The priest and the costs of worship were paid by the Council of State; the congregation was to be reckoned as a portion of one of the Swiss dioceses, and the priest could not enter upon office until he had obtained the confirmation of the State. The new Constitution of Geneva which was established in 1847 still spoke of Protestantism as the "religion de la majorité dans le territoire de l'ancienne République," adding that one Church was nevertheless to be maintained by the State within the city of Geneva for the celebration of the "culte Catholique, comme par le passé."

In 1815, however, a great change occurred. A number of country communes, partly Savoyard, partly French, but all Catholic, were united to the Canton of Geneva. The King of Sardinia, in making over a portion of his territory to the Calvinist Republic, expressly stipulated that "the Catholic religion should be upheld and protected for the future in all these communes by the Government of Geneva, exactly as it has been in times past by his Majesty." The churches and parsonages were to be maintained at State cost, the parishes to remain in the dioceses of Chablais and Faucigny, and the Catholics were to be guaranteed the fullest enjoyment of all civil rights. These and other conditions received the signatures of the King of Sardinia on one part, and of the Swiss Confederation and the Canton of Geneva on the other part, on May 16, 1816, in the Treaty of Turin. More than 16,000 souls, exclusively Catholic, were thus incorporated into the old Protestant Republic, and an international protection was expressly guaranteed to the new Catholic citizens of Geneva by the Congress of Vienna. In 1868, however, by the vote of the whole Genevan people, Catholic as well as Protestant, the confessional guarantees of the Vienna Congress were abolished. The clergy protested; but no protest was made by either of the signatory Powers of the Congress. For the last twelve years the State of Geneva and its Roman Catholic citizens have been engaged in incessant warfare; obligatory civil marriage has been introduced; the public schools have been entirely withdrawn from clerical influence; several ecclesiastical holidays have been civilly abolished; Monsignore Mermillod, Bishop of Hebron *in partibus*, who assumed the title of "Bishop of Geneva," has been banished; the Old Catholics under Bishop Herzog's jurisdiction have been declared to be legal "Catholics" from the State's point of view, and capable as such of institution to parishes and enjoyment of Catholic funds; seven congregations of Sisters of Charity, Little Sisters of the Poor, and Brothers of the Christian Doctrine, have been prohibited from acting as public educators, and permitted only to occupy themselves with the care of sick and other works of benevolence. If the Genevan *kulturkampf* has not had as wide a range as the Prussian, it has been fought with a far more dogged perseverance on both sides.

A Commission to report upon the question of the separation of the Churches and the State of Geneva was originally appointed by the Grand Council nearly two years ago. Their deliberations resulted in the production of three projects of law—one bearing the honoured name of M. Necker, the other that of M. Müller, while the third, which has been finally adopted by the Council after several heated debates, is the work of M. Henri Fazy. Neither of these politicians proposed the separation of Church and State in direct terms. M. Necker's projected Bill contained two leading principles. 1. That no citizen of Geneva should henceforward be called upon "to pay any tax or due the yield whereof is employed for the specific purposes of a religious community to which he does not himself belong"; and 2. "Every taxpayer who makes the declaration that he does not belong to either of the *cultes* which are subsidized by the State must have his name struck off the voting register of the congregation (ecclesiastical parish) of which he has hitherto been reckoned a member." The project of M. Müller freed the State from all future obligations to "the two National Churches," but provided that the Churches should be endowed with a million francs, as a parting gift, and that the State should hand half this sum to the Protestant Consistory, and the other half to a "Constitutional Council" elected by the Catholics of the canton. The latter provision was sufficient to wreck M. Müller's proposed Bill. The "Catholics" of Geneva are hopelessly divided into a Roman Catholic majority and an Old Catholic minority; the former refuse to accede to any State legislation which permits the latter to assume the title and claim the rights of "Catholics." The State replies that it is beyond its power to settle who are and who are not true Catholics; it leaves its State-paid Catholic communes to settle amongst themselves their own domestic controversies on Papal infallibility and supremacy, exactly as it leaves its State-paid Protestant communes to settle whether an orthodox or a rationalist theologian is a true Calvinist, and to elect him as such for their parochial minister.

The project of M. Henri Fazy, which two or three weeks ago passed its third reading in the Grand Council, when 57 votes were given for its adoption and 43 against it, consists of five short articles. Article I., after affirming the principle of liberty of worship, does not assert the separation of Church and State directly, but indirectly. "The State and the Communes pay no *cultes*. No one can be compelled to contribute to the cost of either *culte*." This abolishes Article III. of the new Constitution of 1878:—"L'entretien du culte de l'église protestante et l'entretien du culte catholique restent à la charge de l'état." The next Article of the Fazy Bill states that the "cultes" are henceforth to be organized and exercised under the law permitting free right of association and assembly. With the consent of the Grand Council, every religious society can found endowments, and receive presents and legacies for this purpose; but without an express permission from the Grand Council, it "cannot possess other *immobilia* than temples, churches, and parsonages." By the third article the communes or parishes can dispose of the temples, churches, and parsonages, which are declared to be communal or parochial property, but in any such disposition they must follow the legal form and precedents employed with regard to the land-property of communes. It is presumed that in almost all cases the communes will not be inclined to alienate a temple or church from its present use. The express sanction of the Municipal Council will be necessary before a church used for Protestant worship can be employed for any other use; the same provision is extended to the churches used by the Catholics. The Temple of St. Peter in Geneva, however, is exempted; it is to remain for all time the inalienable property of the City of Geneva. As the Church of Calvin, it is to be devoted solely to Protestant worship, though the State can dispose of it, as at present, for certain national celebrations. Although modern Liberationism is peculiarly a product of those lands and sects in which the Calvinist theology has struck deepest root, and has always been and still is abhorred where the Teutonic theology of Luther and Zwingli has prevailed, Calvin himself was notably a strong advocate for the union of Church and State. Possibly M. Fazy's clause, which establishes Calvin's own Church for ever, may be regarded as a kind of propitiatory oblation to the mighty theologian and statesman to whom Geneva is indebted for its importance in history. The two concluding articles of the

Bill deal mainly with the dissolution of various politico-ecclesiastical articles in the present Constitution of the canton, and with the fixing of "pensions and temporary indemnifications for those clergy whose activity may cease in consequence of the operation of this law." It is proposed that the law shall come into force on New Year's Day, 1882.

It would be quite impossible to give even the most meagre summary of the speeches made on either side during the several days of debate. The material now lying before us would make a huge book. There is one point upon which foes and friends are alike fully agreed—namely, that the disestablishment of the Churches of Geneva, Protestant and Catholic, is an exception and accident; it is a chapter in the history of the *kulturkampf* between the Republic of Geneva and the Papal Chair. The disestablishers claim it as the most destructive battering-ram aimed as yet at the walls of Rome. The foes of the measure describe it, with much more truth, as a first step on the part of the Republic upon the road to Canossa. This is clear enough from the relation assumed by the different political and religious parties in the Grand Council to the question of disestablishment. M. Fazy's majority in the Grand Council has been obtained by a remarkable coalition. Three parties have united in voting for his Bill—the Doctrinary Radicals, or party of the "Young Republic"; the orthodox Protestants, who care more for Calvin's theology than for Calvin's historical Church, who are either members of Dissenting sects or members of the Established Church restive at their forced official brotherhood with their rationalist fellow-pastors; and, before all others, the Genevan Ultramontanists. On the other side, the old Radicals of Geneva—the typical modern Swiss politicians—and the Liberal Conservatives have voted to a man for the retention of the present relations between the State and the Churches. The Vaticanists have nothing to lose by disestablishment, as they get nothing from it, since they refuse to comply with its legal conditions in Geneva. "They have a world-wide party at their back," said M. Chenevière; and he observed that they were already drawing far larger subsidies from their wealthy co-religionists than a poor State like Geneva could provide for them. The vote for disestablishment in Geneva was thus carried by those who are not advocates for disestablishment *per se*, and who would vote exactly the other way if they were in Spain, or even in the Swiss Cantons of Luzern, Freiburg, or Schwyz. M. Favon, in a speech of great power, declared that the passing of the Bill would be in spirit a concession to the *non possumus* of Rome. M. Carteret said that the new law, if it passed the ordeal of the popular *Referendum*, would only intensify the existing confessional struggles. "The State," he observed, "gives the ecclesiastical property to the Catholics and to the Protestants. Who are they? The fight over the answer will be shifted from hence to the communes and the congregations. We are told by the angry partisans that the electoral lists of the Churches give no true reply." The State is told that a certain pastor is not a Protestant, that a certain priest is not a Catholic, and that it has violated the liberties of the two Churches by allowing the one to be inducted, or the other to receive an endowment. The unfortunate State, however, in each case has simply and baldly registered its confirmation of the election of a pastor, Protestant or Catholic, by the majority of those who chose to go to the ecclesiastical poll. As the Vatican has prohibited the "Catholics" of Geneva from taking part in the election of their parish priests, though it has lately conceded the principle in the strong Canton of Bern, the Old Catholic minority has come into possession of many of the churches and stipends. M. Carteret, whose views are of importance on this question, as he was lately elected to the Council by a great majority and on the very ground that he was a defender of the National Church principle, has warned his fellow-councillors that the great mass of public opinion amongst the people of Geneva will certainly reverse their conclusions. It must be remembered that the Grand Council is not "the Sovereign" of Geneva. The programme of the law, after its final polish by its constructors, has to be submitted to the popular *Referendum*, and the relations and proportions of the political parties amongst the people are not the same as in the Grand Council. The result will soon be known, as the plebiscite is to be taken to-morrow; and it is possible that the decision may be adverse to the project, as the devotion of the people of Geneva to the Protestant Church of Calvin and Beza is very deep-rooted, and is not to be judged, as M. Carteret has shown, by the superficial test of attendance at public worship. Professor Vogt, the Darwinist, pointed to States which have adopted the principle of separation of Church and State, as the United States of America and Belgium. The latter, however, is a warning rather than an example. "America," said M. Bonneton, "has produced a heap of rival sects; but such an institution as a People's Church has not yet appeared there." The principle is alien to all Swiss traditions; it finds no acceptance in any of the other cantons, and it is significant that it should have appeared in that portion of the Federation which is least Swiss. Some years ago, as the *Basler Nachrichten* says, "the separation of Church and State was a point of the first rank on the programme of the Radicals." But since the Vatican Council, and the new attitude of defence into which the States were thereby forced, the whole Radical party of Switzerland has cast it away. "The Canton of Aargau alone in German Switzerland," observes the same paper, "some years ago thought of such a solution of ecclesiastico-political difficulties; but we venture to say that after witnessing the experiences of Belgium and the United States, and the Vaticanist difficulties throughout Europe, there is not now one single man in that canton who does not earnestly hope that the people of Geneva will not grant to the resolutions of their Grand Council the force of law."

THE DEBATE ON THE NAVY.

THE usual desultory debate on the Navy Estimates took place on Monday night. The naval reformers made a variety of suggestions and complaints respecting what they consider to be existing evils, and the Government speakers admitted the force of some of them, and either mildly disputed or ignored others. The first matter brought before the House was the old, oft-discussed, but still scarcely intelligible grievance which relates to Greenwich Hospital. It has been often said that the seamen were losers by the change which was introduced when the Hospital was, so to speak, taken away from them; and it has been strenuously asserted by defenders of the Admiralty that the change was, on the whole, very advantageous to the Pensioners. As frequently happens in prolonged controversies, it is by no means easy to get at the true facts of the case; but, in so far as it is possible to understand them, it seems tolerably clear that the alteration made has been advantageous to the seamen. On one point, however, the authorities certainly seem to have been guilty of some sharp practice. The Admiralty may fairly be considered to have held Greenwich Hospital in trust for the naval Pensioners, and therefore, when they were deprived of it, the pension fund should have been augmented by an annual sum equivalent to the rent of the building; and this sum should have been debited to the department to which the Hospital was handed over. Unfortunately this course has not been followed. The Admiralty has treated Greenwich Hospital as though it was theirs to do what they pleased with, and has put down merely a nominal sum for the rent. This proceeding was severely criticized by some of the speakers on Monday night, and the defence of the Government was so weak as almost to amount to an admission that the critics were right. Mr. Shaw-Lefevre appears to have implied that, as the Admiralty pays the rates of the building and pays for the repairs, it ought to be free from all responsibility with regard to the rental. It would be interesting to know whether the Secretary to the Admiralty is prepared to adhere consistently to the view which he thus advocated, and to recommend the letting of Government property to any one who will pay the rates and taxes and keep the buildings in repair. A very large number of applicants are likely to be forthcoming for houses or lands which are to be let on these terms.

Luckily, however, the sum which the seamen lose by official shabbiness is, when compared with the whole amount of the pension fund, but a very small one; and, if a mistake has been made at Whitehall, it is not a mistake of much gravity. After Mr. Shaw-Lefevre's eccentric argument had been subjected to some almost superfluous criticism, Lord Ramsay called the attention of the House to a question of more importance than a trifling diminution of the pension fund. Dealing with a subject which, as a naval officer, he understands, this young member of Parliament showed more sense and moderation than might have been expected after certain occurrences at Liverpool. He had serious complaints to make respecting the present method of nominating naval cadets, and respecting the system of training officers for the navy. There ought, he said, to be no nominations, as at present, but free competition, so that the cleverest youths might be selected for the naval service. At first sight the justice of this demand seems indisputable; but practically there are very grave objections to acceding to it. It is, to say the least, extremely doubtful whether competitive examinations for boys thirteen or fourteen years old are advisable. It is possible to cram a youthful subject in a marvellous manner, and the harm done by the cramming process at an early age is quite incalculable. Nothing could be worse than the admission into the navy of boys whose minds had been prematurely forced, and who would, as they grew up, almost inevitably show that want of real mental vigour which generally characterizes those whose capacities have been overstrained when young. If examiners could be trusted to distinguish clever and promising boys from boys who had merely been subjected to the highest cramming pressure for a considerable period, the competitive system might answer; but, unfortunately, the majority of examiners could no more be trusted to do this than to discover how long candidates are likely to live. Serious evil might be wrought by the alteration which Lord Ramsay desires; and if the authorities at Whitehall are thinking, as Mr. Shaw-Lefevre's reply to Lord Ramsay appeared to indicate, of instituting perfectly open competition, they are certainly contemplating a very dangerous experiment, which may result in irreparable injury to the naval service. A change of a different kind, however, they might perhaps introduce with advantage. Having strongly condemned the method of entry into the navy, Lord Ramsay went on to find fault with the whole system of training naval officers, and first complained that there was no use in conducting the early part of their education on board the *Britannia*—a hulk without masts—merely for the sake of having them nominally on board ship. He urged that they could be better taught in a school ashore. Here he was probably right, and no doubt a kind of nautical pedantry has been shown in keeping the cadets on board the *Britannia*. In his other criticisms

Lord Ramsay was less happy, and indeed some of his suggestions might with justice have been sharply censured. He said that naval cadets entered the service too young and went to sea too early. He might almost as well have suggested that boys who are intended for engineers should not receive mathematical instruction at school. In these days, when a naval officer must possess varied qualifications, his training can hardly begin too soon; and, unless a man has been at sea in boyhood, it is almost impossible for him to acquire the art of handling a ship. It is perfectly true that the art of handling sailing-vessels, which constituted old-fashioned seamanship, is not now quite so important as it was; but it has been succeeded by seamanship of a different kind, well-nigh as difficult to master as the old; and it may be said with confidence that this will never be mastered except by those whose training has begun in youth. What Lord Ramsay would substitute for the present period of service at sea he did not state, but seemingly he wishes that midshipmen should study ashore during the first four years which are now spent afloat. Happily Mr. Shaw-Lefevre, though complimentary in the extreme to the youthful critic who spoke from his side of the House, did not encourage his singular fancy for keeping naval officers away from the sea.

After Lord Ramsay's speech had received its full meed of praise, the inevitable Irish grievance was duly brought forward to distract the House: but fortunately the House was in a sensible mood, and after Mr. O'Connor had ended an indignant speech by moving the postponement of a vote, and had been told by the Chairman that his motion could not be put, few members troubled themselves about what he said; nor did he succeed much better later in the debate when he twice divided the House. After the very brief discussion to which his first complaint gave rise was over, Mr. Cavendish Bentinck, who has so often appeared as a naval critic, pointed out briefly and forcibly the defective condition of the navy, and its unfitness for defending the country in case of war. There was not, said the member for Norfolk, a proper reserve of ironclads, nor anything like the number of fast cruisers which, in the event of a war, would be required to protect our commerce and our supplies of food; and he went on to state, with perfect truth, that no Government has been courageous enough to tell the House of Commons that, as the cost of everything connected with the navy had so largely increased, the sum required for the navy should also be largely increased. Mr. Rylands, who followed Mr. Cavendish Bentinck, thought apparently that he disposed of his statements by saying that they were familiar to the House, and no doubt this is a very convenient retort when facts cannot be disputed. Mr. Shaw-Lefevre, as was to be expected, did not rely upon the form of reply which seems conclusive to members of Mr. Rylands's calibre, but endeavoured to refute Mr. Bentinck's allegation. There were, he said, five ironclads in the first reserve, and ten fast cruisers to rely upon. Moreover, three vessels of the latter class were being built. To these it is possible that some converted ironclads may be added. If the Secretary of the Admiralty had wished to confirm the statements of Mr. Bentinck, he could hardly have done so more forcibly. To protect our commerce all over the world we have ten first-class fast cruisers ready, three building, and obsolete ironclads which it may some day be found possible to convert into fast cruisers. Let it be assumed that the three ships now being built are completed, and that five ironclads are successfully altered. Excluding those merchant vessels which are under fifty tons, we shall then have one fast cruiser for every 1,273 merchant ships. It is only fair, however, to Mr. Shaw-Lefevre to say that he considers that the country has a source of strength apart from its war-ships. "It had been ascertained," he said, "that there were thirty or forty first-class vessels which by a small expenditure might be rapidly converted into vessels of war." On this subject it is scarcely necessary to repeat what we said a short time ago. The employment of modern merchant steamers as men-of-war is an experiment which may altogether fail, and is not very unlikely to fail. Any one acquainted with the differences of construction between men-of-war and merchant ships can hardly fail, in considering this question, to come to the conclusion that either many of the elaborate precautions taken in constructing men-of-war are superfluous, or else that merchant steamers can by no possibility be rapidly converted into effective vessels of war. It is greatly to be hoped that the Admiralty have not been hasty in assuming that these vessels can be fitted for service, and that, in the event of preparation having to be made for war, it may not be discovered at the last moment that war ships cannot be improvised. Mr. Shaw-Lefevre's answer to Mr. Cavendish Bentinck produced no hostile comment except from Mr. Bentinck himself; but this probably was because the late Government are responsible for the project of arming merchantmen. The debate continued for some little time after this reply, and various subjects were touched on, but nothing of interest was said by speakers on either side of the House.

THE UNIVERSITY MATCH.

When the University match is played in brilliant June weather the moment is one to which Faust might have said, "Stay, thou art fair." No weather could be more perfect than the warm sunshine, tempered by cool winds, which the players and the spectators at Lord's enjoyed on Monday and Tuesday. Ladies were able to wear the most brilliant dresses without fear of a drop of rain, and they, except the few who took an intelligent interest in the fortunes of Oxford, were probably happy. The cricket was much better than most of the critics have been disposed to allow. The practice of criticism makes people fancy themselves far too clever. They make no allowance for mortal infirmities. It is uncommonly easy to field well, in the Grand Stand, and to censure, in the Pavilion, the performance of a bowler who occasionally delivers a loose ball to leg. One reviewer complains that Mr. Steel "was not straight." Of course he was not straight when he was bowling for catches to cover point. For our own part, we think the cricket was a sufficiently exciting and enjoyable spectacle, though Oxford from the beginning played an uphill game, and at last got a bad beating. It was scarcely possible for Cambridge to lose. It is true that Mr. Alfred Lyttelton had left them, and Oxford may reflect with relief that he is the last of the Lytteltons of this generation. But Cambridge had still a number of famous veterans. Mr. Steel had been batting better than ever, and bowling as only he can bowl; Mr. Bligh has not forgotten his cunning; Mr. Whitfield, previously unfortunate, reserved himself for this match. Mr. Morton, who discomfited the Australians two years ago, was bowling as many fast "yorkers" as ever. Mr. C. T. Studd was known to have an impregnable defence, and in him, his brother, and Mr. Wilson, Cambridge possessed three astute change bowlers. Against this array of merit Oxford had only one first-rate player, Mr. Evans, who is perhaps the best fast amateur bowler of the day. Not one name on the Oxford side is associated with steady successive batting. In the trial matches Cambridge had made over five hundred runs against an Eleven whose bowling (that of Mr. D. Buchanan and Mr. Rotherham) rather puzzled Oxford. Cambridge had defeated Surrey; Oxford had been vanquished by a mild Middlesex team; M.C.C. had beaten both Universities; but Oxford had suffered the heavier defeat.

With all these reasons for confidence, Cambridge won the toss, and had the first experience of a very good wicket. The ground played fast, but not too fast, and at first rather favoured Mr. Evans. His second ball scattered the stumps of Mr. Whitfield, and then Mr. Steel joined Mr. Bligh, and played rather a lucky innings of 19, before Mr. Harrison bowled him with a ball that curled round his legs. Mr. Harrison is a freshman from Clifton, a judicious and accomplished slow bowler, who did not, however, take many wickets in this match. Mr. Bligh at first seemed ill at ease, and cannot have been reassured by the way in which Mr. Evans bowled Mr. Jones and Mr. C. T. Studd. At this time the bowling was admirable, the fielding exemplary, and scarcely any hits reached the ropes. Enthusiasts whispered that "Evans was on his day," and it was hoped that he might serve Cambridge as he did Daft's Eleven in spring. But Mr. G. B. Studd (who had not previously been very successful this year) joined Mr. Bligh, and the pair played faultless cricket. Their free and graceful forward play was peculiarly admirable. In this important part of the batter's art the Cambridge Eleven is infinitely superior to Oxford. This is partly due, it may be supposed, to the excellence of the fast Cambridge ground. No one can learn to play forward safely among the reeds and rushes of Cowley Marsh. Mr. Colebrook, on the Oxford side, has not yet been spoiled by the marsh; and, considering his limited reach, his forward play in the second innings deserved high praise.

Luncheon, as usual, did the bowlers more good than the batters. Mr. Evans sent in a ball which cut Mr. Studd down and bowled him "leg before wicket." His 38 was obtained by sterling cricket. Mr. Wilson gave promise of the excellence he was to show in the second innings; but Mr. Bligh was caught from the slow bowler after making 59, the highest innings in the match. He and Mr. Studd had taken the sting out of the bowling, and had scored freely, in spite of fielding in which criticism could scarcely find a fault. The resolute play of Mr. Morton brought on Mr. M'Lachlan and Mr. Thornton as bowlers. The former has improved, and bowled with great pluck and steadiness. Perhaps it was scarcely prudent in Mr. Fowler to keep wicket to him without a long stop. Fourteen byes in each innings look ill in the scoring-sheet, and aided the Cambridge total of 166. Almost every wicket was bowled, and scarcely a single chance was offered to the field. Oxford sent in Mr. Colebrooke and Mr. Trevor to the bowling of Mr. Steel and Mr. Morton. Mr. Trevor is an extremely fine hitter, and should improve into a really good bat. Neither he nor his companion could resist the temptation to run out to Mr. Steel's bowling, and Mr. Foley, the new wicket-keeper, took advantage of two easy chances. Mr. Evans, a very free hitter, made twelve runs, but not in his best manner. He was bowled by Mr. Morton, who then dismissed Mr. Patterson and Mr. Thornton, both useful bats, with two consecutive fast balls. It was Mr. Morton's day. After Mr. Green, the Oxford captain, had played with his usual and always ill-rewarded steadiness for 14, he put his leg where his bat should have been. Things looked very bad, and grew worse. Mr. Fowler joined Mr. Hirst, and the out-fielders betook themselves to remote corners of the ground. In Mr. Fowler's case it was known how much the desperate dare. He scored one, and then hit across at a pitched-up ball of Mr. Morton's. "The immense slogger" (as an art-critic would say) was out for one run. At this moment seven wickets were down, and six runs were wanted to save a "follow on." Mr. Evelyn went in—in the hush of expectation you might have heard the fall of the ash of a cigarette. The first ball sent Mr. Evelyn back to his friends. Mr.

Morton had two balls of his over left, and there were two wickets to fall. Mr. Harrison's stumps were scattered abroad like chaff before the gale. Mr. M'Lachlan was the last representative of Oxford, and, as he went in to keep up Mr. Hirst's wicket, his condition seemed as hopeless as that of the last of the old Highlander's sons in the *Fair Maid of Perth*. Mr. Morton's fourth ball just did not take his off stump. Mr. Morton's day was ended, no other wicket fell to him. The first ball of his next over Mr. M'Lachlan cut into the crowd for four, and saved the innings by two drives. Mr. Hirst began to score freely. No one in either Eleven cuts with such crispness of touch. Mr. Steel sent in a ball, which Mr. M'Lachlan returned. The bowler thought he had made a catch, and was returning to the pavilion, when some one put a question to the umpire, who decided in favour of Mr. M'Lachlan. To ourselves it certainly seemed that the umpire was right, but most of the spectators appear to have shared the view of Mr. Steel. The cricket was now very lively. Bowler after bowler was tried, and hit by Mr. Hirst and Mr. M'Lachlan to the ropes. At last Mr. Steel bowled Mr. M'Lachlan. He and his companion had added fifty-one runs to the score. Mr. Hirst's contribution of 49 was slightly marred by one fault. He gave a hard chance to cover-point near the end of the innings.

Cambridge put on five runs before seven o'clock, and on Tuesday morning Mr. Whitfield and Mr. Wilson began the day with a magnificent stand. All the very limited Oxford bowling was tried, and at last Mr. Green caught Mr. Wilson off one of his own under-hand slows. More than fifty runs had been scored, and, though the fielding was not demoralized, the heat had told on the bowlers. Mr. Evans had a deserved piece of luck—a ball of his struck the wicket-keeper's pads, and rebounded into Mr. Steele's wickets when that player was out of his ground. Mr. Fowler stumped Mr. Walker in the same odd way last week. Mr. Bligh was becoming dangerous, when Mr. Trevor caught him cleverly at long-stop. Mr. Fowler ended Mr. Whitfield's fine innings (32) by a sharp catch off Mr. Harrison. Then the two Studds got together, and, over by over, the score and the faces of the friends of Oxford grew longer. The brothers seemed "set" from the first. When they had added some forty runs, they were both missed by the same unhappy fielder, once at short-leg, and again at mid-off. The former was a hard chance, but people had time to see the latter. It is a terrible moment when a man drops a catch at this match. The friends of his side could inflict on him the most exquisite tortures, and the victim vainly hopes that the earth will open and swallow him. Luncheon found the score of Cambridge almost exactly what it had been on Monday. Some splendid leg-hitting off Evans had contributed many runs. After luncheon runs came as fast as ever, till Mr. M'Lachlan was tried. The bowlers' feet had worn holes in which they stumbled, but after a free expenditure of sawdust Mr. M'Lachlan bowled Mr. G. B. Studd's leg-stump. His 40 runs were made with but one chance. Mr. Evans instantly dismissed Mr. Ford, and an astonishing catch at square leg by Mr. Hirst got rid of Mr. C. T. Studd. Mr. Hirst was running at full speed near the ropes when he caught the ball high over his head. This catch far more than redeemed a slip which cost some runs at an earlier part of the game. But Cambridge batting was not yet exhausted. Mr. Lancashire, who for so many years was "twelfth man," got 29 runs, and Mr. Morton was not out with 16. The bowling of Oxford was never exactly demoralized, and Mr. Evans especially showed great pluck and endurance. Many of the runs made off him were rather flukey hits behind the slips. We think that the fielding has been too severely blamed. Mr. Greene missed a hard catch from his own slows; but he, and the Oxford cover-point, and Mr. Evans at slip, stopped many hits that were bound for the ropes. The fielding of Mr. Trevor, too, was to be commended, and Mr. Hirst's catch was as wonderful as any that Mr. Webbe ever made. But the Cambridge batting, in so true a wicket, wore down the few bowlers.

Oxford (as in 1878, when they scored thirty-two in their second innings) had to go in for 267 runs, a dispiriting uphill task. It was the fortune of Mr. Steel to retrieve his ill success as a bat, and to dismiss Oxford for 151. Mr. Morton lent him no aid. Mr. Wilson twisted the ball about in his hand in vain; and Mr. C. T. Studd made as if he were spinning a top to no purpose. Only Mr. Ford shared the wickets with Mr. Steel, taking two to his captain's seven. Yet the bowling of Mr. Wilson often seemed to puzzle the batsmen. Mr. Steel began by bowling Mr. Trevor for four; Mr. Thornton and Mr. Patterson were soon deceived by his craft; Mr. Greene, with his usual luck, was thrown out by Mr. Jones; and Mr. Hirst did not play as he played on Monday. Mr. Fowler joined Mr. Colebrooke when five wickets were down for about forty. A special miracle saved the hard-hitter from being caught, and he settled down to determined slogging. The other bowlers he often deigned to play, but his heart was set on hitting Mr. Steel. Mr. Colebrooke was playing with perfect science; but it was in Mr. Fowler that the spectators delighted. The match became a duel between him and Mr. Steel. Mr. Fowler apparently calculated (and rightly) that, if he got hold of the ball, no mortal could catch it. Beneath one of his hits the bowler (not Mr. Steel) and umpire cowered in dread, like the Phæacians when Odysseus putted the stone; and the ball flew hurtling into the awning stretched across the line of sight. Other hits, if the walls and houses had been removed, would have "travelled," as golf-players say, into Oxford Street. Meanwhile Mr. Colebrooke played with grace and caution, and made several fine cuts and hits to leg. But the hitting of Mr. Fowler could not last for ever. He sent up a high spinning catch to cover-point, a catch which Mr. C. T. Studd was bound to hold. His 42 was a pretty piece of punishing hitting. Mr. Evans followed, using a bat which seemed to have an extraordinary spontaneous power of driving. A mere touch sent the ball for four, and when Mr. Evans lifted a catch, this magical bat popped it high over the head of the fielder. In about seven overs Mr. Evans made 22. Mr. M'Lachlan did not repeat his interesting performance, and Mr. Harrison's laudable 10 only brought the score up to 151. Mr. Colebrooke's 34, not out, was almost faultless. The bowling of Mr. Ford towards the end of the innings was good, and the Cambridge fielding left little to be desired. A very strong batting and bowling team won on its merits, in spite of the two odd pieces of luck which fell to Oxford—the stumping of Mr. Steel and the escape of Mr. M'Lachlan. Two of the Cambridge men have been chosen to play for Gentlemen *v.* Players at the Oval. Mr. Morton's fast bowling found five of the Players as easy victims as the unlucky and nervous batsmen whose wickets were levelled on Monday. Oxford has not won a match since Mr. Buckland and Mr. H. G. Tylecote did marvels three years ago. Though an excuse may be sought in the state of Cowley Marsh, Cambridge really owes her success to a series of admirable players from Eton, Uppingham, and Marlborough. Next year Oxford will probably have the help of the best batsman and the best wicket-keeper of this year's public school teams, and victory may shake her light wings and leave Cambridge for the banks of Isis.

GRIEVANCES OF THE SUGAR TRADE.

Most of our readers are doubtless aware that a Committee of the House of Commons has been sitting through three Sessions inquiring into the complaints of the sugar-refiners. The Committee was appointed last year at the instance of Mr. Ritchie, was reappointed in the Session which was cut short by the Dissolution, and was again appointed, with the necessary modifications, in the present Session. Last year the evidence taken bore almost exclusively on the grievances of the refiners. But this year the opposing case is being heard; and we venture to think that the refiners have had reason to doubt whether they were well advised in pressing for the Committee. One fact brought out by the investigation is that the trade, as distinguished from the refiners, is opposed to the latter. But a much more important fact is that impartial statistical inquirers bring forward evidence to show that the complaints of the refiners are in the main unfounded. The refiners contend that the bounties upon exportation given by foreign countries, especially by France and Austria, are gradually killing the refining industry in the United Kingdom, and moreover are rendering unprofitable the cultivation of cane sugar in our West Indian colonies. It is manifest that before considering whether a remedy ought to be applied it is requisite to ascertain whether the facts are or are not as have been stated. If they are not, there is no occasion for further inquiry. If they are, the question arises whether to attempt to set things right by any method hitherto suggested would not do more harm than good. But the first point to settle clearly is as to the facts.

Now it happens that, when examined by the Committee the other day, Mr. Giffen put in some tables which go to prove that the facts are not as represented by the refiners; in other words, that neither the English refiners nor the West Indian sugar-growers are being ruined. The first table presented by Mr. Giffen is a statement from the circular of Messrs. Rueb and Co., of the production of raw sugar in the several countries of the world from 1853 to 1879, both inclusive. The fact that this circular is laid before the Committee by the Head of the Statistical Department of the Board of Trade testifies sufficiently to the authority which it has acquired. Without further preface, then, we may say that the total production of sugar has risen within the period mentioned from 1,476,714 tons to 3,119,570 tons; that is, it has considerably more than doubled in the quarter of a century under review. But the refiners contend that not only has the whole increase been of beet sugar, but that beet has been driving the cane out of cultivation. Let us see how this is. The table, as we have said, gives the production from each country separately; and we can, therefore, with little trouble determine the point. We find that in the British West Indies the production rose from 109,000 tons in 1853 to 189,000 tons in 1878, the latest year for which we have the figures. This is an increase of over 75 per cent. It is less than the increase for all kinds of sugar; but still it is a very great increase, and lends no kind of countenance to the assertion that the West Indian planters are being ruined. In all the British possessions taken collectively, including Mauritius, India, Australia, and Natal, as well as the West Indies, the increase has been from 253,000 tons to 394,000 tons, or 141,000 tons, being about 55 per cent. The augmentation here is less than in the former case; but still it is very considerable, and certainly lends no support to the allegation that our sugar-growers are being ruined. In foreign cane-growing countries the increase has been from 1,023,000 tons to 1,305,000 tons, or 282,000 tons, being over 27 per cent. Here the increase is still less than in either of the preceding cases; but still, in itself, it is not inconsiderable.

Taking all cane-growing countries, British and foreign, together, the increase has been from 1,276,714 tons to 1,698,743 tons, or 422,029 tons, being somewhat more than 33 per cent. It will thus be seen that, while there has been increased production to the extent of one-third in all cane-growing countries taken together, the increase has been to the extent of more than three-quarters in the British West Indies—that is, it has been greatest precisely where the cultivation is said to have been ruined. But it is undoubtedly true, at the same time, that the extension of the cultivation has been far more rapid in beet-growing countries, having risen from 201,000 tons in 1853 to 1,574,133 tons last year, or 1,374,130 tons, being very nearly sevenfold. Or, to put the matter in another way, the production of beet sugar a quarter of a century ago was only 14 per cent. of the total yield, and it is now 45 per cent., or not far short of one-half. This is unquestionably a very striking and a very rapid development. But the fact must not be lost sight of that all the parts of the total are increasing, and not the beet alone, although the latter is growing by far the most rapidly. So far, then, as our West Indian colonies are concerned, the case of the refiners is disproved. Cane sugar in the West Indies is not being driven out of cultivation. Why the cultivation is not increasing as fast as that of beet is another matter. Possibly the bounties may have something to do with it. But it is much more probable that the disorganization of industry by the emancipation of the negroes, the race animosities of which we have had examples in Jamaica and Barbadoes, the want of capital, skill, and intelligence, and unwise legislation by local Parliaments, are in a large degree responsible for it. In any case, before the question could be decided, an inquiry upon the spot would be necessary. Before concluding this part of our subject we may remark that the mistake of the refiners has no doubt arisen out of the fact that the imports from the West Indies into this country have hardly increased during the quarter of a century, the additional production being attracted to the United States.

Coming now to the complaint of the refiners that they themselves are being ruined by the bounties, let us inquire what grounds there are for it. We find in the first place that the total import of sugar of all kinds has risen in the quarter of a century from 7,200,000 cwt. to 18,184,000 cwt., or, say roughly, 250 per cent. But of this quantity the refined sugar amounts to no more than 3,266,000 cwt., leaving nearly 15 million cwt. of raw sugar, that is, of the raw material for refining. Of course, the whole of the raw sugar imported is not refined in this country. Part of it, though technically called raw, really requires to undergo no further process, but is already fit to go into consumption. And part also is used in brewing. Making the necessary deductions, there remain, however, 11¼ million cwt. of the raw material for refining, which is an increase of almost 60 per cent. No doubt it is true, as alleged by the refiners, that the amount of refining as regards loaf sugar has greatly declined in this country. But the figures we have just given demonstrate that the refining business as a whole has not declined, but on the contrary has increased. The consumption of sugar in the United Kingdom has been augmented enormously in consequence of the successive reductions and final abolition of the duties formerly levied upon it, and in consequence also of the great advance of the country in wealth and population. The enhanced demand thus occasioned has been supplied partly by an increase of refining in this country, and to a very much larger extent by an increased importation of foreign refined sugar, more particularly of refined beet sugar, the importation of the latter having risen from 262,000 cwt. to 3,136,000 cwt., while the increase in refined cane sugar is trifling. It is quite possible that the bounties have stimulated this enormous growth of the import of refined beet sugar; but there are reasons for believing that, as the late M. Chevalier said a few years ago to a deputation that waited upon him in reference to the question, the French refiners are more skilful than our own, and are careful to provide themselves with the very best machinery. It is also probable that there are agricultural advantages in the cultivation of beet. But, whatever may be the cause of the extraordinary development of beet cultivation on the Continent, and of the success with which beet sugar competes with cane in neutral markets, it is demonstrated by the figures above cited that sugar-refining is not dying out in the United Kingdom, and that the sugar-cane is not being driven out of cultivation in the West Indies, but that, on the contrary, both industries are increasing, though increasing very much less rapidly than their competitor. This being so, the case of the refiners falls to the ground. That they are more or less injured by the false and mischievous bounty system adopted by other countries we are in no way concerned to deny; but the facts of the case do not sustain the allegations of hopeless decline and impending ruin which have led to the present inquiry.

ARCHITECTURE IN 1880.

THE architectural achievement of 1880 is incontestably Truro Cathedral, and public recognition of the building's merit, as well as of the architect's genius, has followed with unusual promptness. It is not many weeks since the Heir Apparent laid the first stone, and Mr. Pearson has already received the Queen's Gold Medal at the Institute of Architects, and the full honours of R.A. We are not surprised at the way in which this work has taken possession of the public imagination, for associations gather round a cathedral such as no other building could evoke; there, as nowhere else, religion, art, and order join hands in a structure which is not only magnificent in itself, but exists to offer its magnificence to the holiest of purposes. Nor does even this consideration conclude the matter; for the cathedral is, moreover, the symbol and the instrument of a great constitutional organization. The ideas of worship and order belong to every cathedral, however small and plain, although the popular, as distinct from the formal, use of the word may appeal to conceptions of size and of artistic beauty. In the revival of life within the English Church, the necessity of cathedrals as orderly institutions was, naturally enough, first recognized, irrespectively of æsthetic considerations. Then gradually the newly-awakened want had to be educated up to those visible conditions of splendour and area which critics of a school hardly yet extinct were wont, not so many years since, to argue had passed away with the departure of the middle ages and the decay of Popery. The colonial dioceses, launched as they were upon the world with everything to begin from nothing, were the first to set about cathedral-making; and now, among the many churches claiming that dignity in our various dependencies, there are several which offer satisfactory external credentials of fitness to assume the lofty designation. Not to go back to buildings of an earlier date, it is not many days since the newspapers have recorded the first stone being laid of a cathedral of ample proportions—equal, indeed, to those of Ripon—at Melbourne, due to Mr. Butterfield. To come home to the United Kingdom, the community from which we should have least expected such action was foremost in the enterprise. The Irish Church, in the very agonies of its disestablishment, produced a very stately cathedral at Cork, designed by Mr. Burges. The Episcopal Church of Scotland caught the inspiration, and after some meritorious 'prentice strokes at Perth, Cumbrae, and Inverness, took its stand with that cathedral of Edinburgh of which we have already spoken, and in which, happily alimented as it was by a most liberal endowment both for building and for future establishment, Sir Gilbert Scott constructed a minster on the scale and with the characteristics of those of the second order existing southward. England itself had, last but not least, to take its place in the procession, and the occasion was provided in the creation of the new diocese of Truro, where the parish church of the see-town was too small and too mean to serve even as that which, by a clumsy word borrowed from the modern Romanists, is now frequently termed pro-cathedral. Bishop Benson showed himself most truly practical by despising the imputation of being visionary, and under his inspiration the Cathedral of Truro is, as we see, really in hand, while Mr. Pearson's designs form the most important series contributed to the architectural room of the Royal Academy (1105, 1118, 1129, 1165).

The first church which brought Mr. Pearson's name into favourable prominence is that of Holy Trinity at the Middlesex end of Vauxhall Bridge, with its conspicuous spire, and in this the artist did not travel beyond very developed English Middle Pointed; but in his considerably later St. Peter's, near the other end of the same bridge, and on the site of the famous Gardens, he transferred his allegiance to Early Pointed with French characteristics. At St. Augustine's, Kilburn, about as far removed in date from St. Peter's as that is from Holy Trinity, Mr. Pearson, while still retaining his preference for the earlier phase, limits his choice of details to English precedent. At Truro, although adhering to what one must, in its non-conventional sense, term early English, the architect has, in dealing with his windows, not disdained those more simple forms of tracery which came in with the dawn of the second style. The total length of Truro Cathedral will be about 300 ft.—longer, that is, than Ripon Minster, with its 270 ft., and about equal in length with Southwell, Rochester, and Hereford. The building may generally be distributed into narthex, with double steeples bearing spires, nave with aisles, crossing surmounted by a lofty tower and spire, aisled transepts, and aisled choir with —as at Canterbury, Lincoln, Salisbury, Rochester, and York—secondary transepts. Under the choir is a crypt. In the angle of the south nave aisle and the south transept, and therefore westward of the latter, a circular baptistery is placed, and southward of the south aisle of the choir a very interesting adjunct is discerned —namely, a chapel parallel to the cathedral, which is, in fact, the southernmost of the two aisles composing the actual parish church of Truro. This rich and characteristic specimen of Late Perpendicular is well worthy of preservation, and has been very ingeniously preserved. The central arcade of the old church is retained, and so necessitates another very narrow aisle between itself and the southern arcade of the south choir aisle. So there are to the south of the choir three nearly parallel aisles, by which a very picturesque interlacing of perspective is secured for this portion of the cathedral. The west front is a composition of double porch and window comprising an equal triplet of lancets, and a rose above the whole, set in a fenestriform panel. The always difficult joining of tower and spire is masked both in the western and the central steeples by lofty angle turrets and long dormer lights. Adjacent to the narthex bay on the south the porch is placed, but on the north the exit is in the second bay, and leads into the cloister. The nave is of four major and eight minor bays, vaulted in four severies with flying buttresses; the piers are alternatively of massive and of lighter section. The clerestory is composed of coupled two-light windows in each major bay, with rudimentary tracery; there is also an inner plane of tracery, with a triforial passage. The aisle windows are a couplet

of lancets in each minor bay. The western transept is a picturesque composition of a triple porch, three equal lancets, and a bold rose; while its eastern angle is emphasised by a conspicuous turret bearing a four-sided spire, a four-light plate-traceried window marks the secondary transept, and the clerestory of the eight-bayed choir is of two-light windows. Each choir-bay is groined, and the piers are of equal size. The altar is placed one bay to the westward of the east end. The eastern elevation shows two tiers of equal triplets, the upper being the longer, and there is a rose in the gable. The nave triforium shows in each bay four equal lancets, with a pierced quatrefoiled circle in the head, the containing arch being rather depressed. In the choir the triforium has three equal lancets in each bay, with two oval unpierced panels. Sixty-eight stalls are indicated in two rows. The central tower is particularly grand, with its two ranges of windows (the lower, the shorter one, of equal triplets of two-light windows deeply recessed). The octagonal Chapter-house is, according to rule, at the eastward of the cloister, and therefore ranges with the north choir aisle.

Mr. Brooks has been put to a severe test in the exterior of his minster-like new parish church at Woolwich being placed close to one of Mr. Pearson's designs (1164, 1218). But he stands the trial creditably. This large Early Pointed church is upon a cathedral-like plan with transepts and double western steeples. In the interior, which is groined, the effect of a triforium is given by a continuous range of panels to be filled with pictures or sgraffiti. We regret that Mr. Street should have chosen to present his new church of St. James's, Paddington, in a cross view taken from the north aisle (1162). He thereby produces a very picturesque grouping, but he baffles critics. We have already described from actual inspection Mr. Street's admirable recast of the interior of the Guards' Chapel in Birdcage Walk (1134); we shall therefore now only express our gratification that the design of this noble basilica should be shown. Messrs. Bodley's and Garner's interior of the new St. Michael's Church, Camden Town (1110), is a dignified revival of that Late Middle Pointed method which has of recent years been too generally neglected. The church will be groined all through. We do not know why the interior of a church to be built by Mr. Blomfield in John Street, Berkeley Square (1188), is called a Mission Church. We conclude that the building is really that which is known as a Chapel of Ease to some parish church. It is a broad and lofty conception in Early Pointed. The nave has a quasi-waggon sort of roof of four cants, while the chancel is groined. The large space over the chancel arch is filled with a composition in which some small windows are set in rather large and coarse arcading. This had better be reconsidered, as it diminishes the apparent scale, and derogates from the effect of the church. Mr. Frank T. Baggalay's design for a baptistery (1160) is, we suppose, a young man's work of fancy, and as such merits praise. It is a sort of translation into English Middle Pointed of the Baptistery of Florence. But the developed fleche ought not to cap the dome; *Utrum horum mavis accipe*, for they do not coalesce cheerfully.

The intended cathedral for Lahore, by Mr. J. Oldrid Scott (1172), follows the recognized European prescription, and exhibits an apsidal choir, crossing with fleche and transepts, nave and aisles, and two western steeples, though with apparently some climatic accommodation and two western steeples. The capping of the steeples, saddle-backs with fleches springing from the ridge of each, is by no means a lucky idea. The composition is evidently strained and the outline ungainly. The design, by the same architect, for the rebuilding of the parish church at Burton-on-Trent (1145) is so ruthlessly skied as to make it almost impossible for visitors to examine it efficiently. The wooden roof of the nave is of an elaborate construction, and we are inclined to think will be successful in its effect. We are less confident about that of the chancel, in which the fifteenth-century plan of open tracery in the spandrils has been revived.

Mr. G. H. F. Prynne was hampered in his task of rebuilding St. Peter's Church, Plymouth (1209), by the obligation of having to retain the sanctuary added to the old church by Mr. Street, which is, with all its merits, of much smaller dimensions than the new pile. We must limit our praise by demurring to the eccentric double transept, in which two equal gables crown a composition comprising in each portion two rows of equal triplets surmounted by a rose window. This is a specimen of novelty which can plead no apparent gracefulness in justification, and it is still more incongruous as the aisle windows are developed Middle Pointed of two lights.

It is refreshing to observe that, while so many of their brethren have been frolicking among the vagaries of the revived eclecticism so-called Queen Anne, a knot of architects have, with serious purpose and much success, studied the genuine Late Pointed of England, and offered designs which reproduce the compromise between picturesqueness and rhythmical symmetry which stamped Perpendicular in its domestic, collegiate, and ecclesiastical aspects. The examples which appear to us most worthy of commendation, taken as they appear in the catalogue, are the new schoolroom, cloisters, and chapel extension of the King's School at Sherborne, Dorset, by Messrs. Carpenter and Ingelow (1090); the garden front of a Surrey house (namely, the architect's own), by Mr. Street (1091), which exemplifies the earlier and more noble type of half-timbered composition; part of the new buildings to be added to Magdalen College, Oxford, by Messrs. Bodley and Garner (1142); and Sion College Library, as proposed to be rebuilt on the Thames Embankment, by Mr. Blomfield (1152). We should assign to a meritorious second class the design for the chapel for the Roman Catholic Public School at Earl's Court, by Messrs. Goldie and Child (1092 and 1095); and the buildings which are being erected for the Merchant Taylor's Company by Messrs. E. I'Anson and Son (1094). The huge Perpendicular St. Benedict's Monastery, near Canterbury, by Messrs. Dunn and Harrison, seems to be too straggling in its grouping.

The new St. Paul's School at Kensington, of which Mr. Waterhouse supplies a sketch design (1177), is a huge pile in that phase of neo-Gothic which is identified with its clever designer. As far as we can judge from a highly coloured perspective, this composition will hardly be a favourable example of the architect's peculiar method. On a much smaller scale is the house which Mr. Waterhouse is now rebuilding at the corner of Piccadilly and Old Bond Street (1119.) The site is a very lucky one for a venture in the picturesque town architecture, conspicuous as it is at an angle from the north-west side of St. James's Street. We fear, however, that it will prove hardly massive enough for its surroundings. The Hanging Committee have so effectively skied Messrs. Pugin and Pugin's St. Benedict's College at Fort Augustus (1182), as to make it impossible to notice the work, which is, we believe, a recast in ecclesiastical Gothic of this old fort, so well known in the annals of Highland fighting during the eighteenth century. Mr. Robins shows an unsuccessful but meritorious Jacobean design for the City of London Schools to be constructed on the Embankment (1204.) Mr. Collcutt prefers Dutch Renaissance (1217). Mr. Knightley's design, to which the second premium was assigned (1147), is in Renaissance. The winner does not show. Mr. West Neve's version of Dutch Renaissance in his offices and warehouses, Long Lane (1205); and Mr. Edis's West London School of Art for Great Titchfield Street (1103), in the same method, deserve notice.

The highly coloured drawing of the quaint but very clever Library to which Mr. Burges has treated himself in his Villa at Kensington (1178) is one of the specialities of the Exhibition. Mr. Norman Shaw's Tudor country house at Sunninghill (1126, 1127), in half timber and South-Eastern tile-work, with many gables, overhanging upper story, and the long low proportion of its age, is a genuine and attractive design, quite free from the affectations of the modern craze. Simplicity and the honest desire to restore, in contrast to improving, characterize Mr. W. M. Fawcett's restoration of the East Front of Queen's College, Cambridge (1149). Mr. J. D. Sedding's large Elizabethan house is too exuberant (1146). Fancy designs ought always to be produced under the conditions of possible execution, or else there can be no fair test of comparison. In contrast to this vast pile stands a picturesque house in Jacobean by Mr. Collcutt, which, as we learn, is actually to be built (1117). Mr. Maurice Adams in his warehouse at Leeds (1153) exults in much Queen Anne. The drawing of Rawdon House, Herts, by Messrs. George and Peto (1163), shows a handsome Jacobean. The Catalogue talks of new wing and of restoration. The wing is well developed out of the older structure.

Mr. C. Barry shows upon the same sheet Clumber Park, Notts, as it appeared before the recent fire, and as it is to become under the restoring hand (1125). The old building was in that heavy and certainly naked English version of the Palladian style of which the Horse Guards is a specimen, but it seems to have lacked the picturesque originality of the clever conception of Kent. New Clumber will certainly be more ornate, but with all the trouble which Mr. Barry has bestowed upon it, it will still remain heavy. He should have been bold and given spires like those which lend something of a sky-line even to the Escorial. Professor Lewis in his new Slade Schools for University College, London (1169), is constrained to carry out the idea of conventional Grecian in which that specimen of George IV.'s taste is constructed.

In contrast to many exhibitions of recent years, the ecclesiastical and scholastic phase of architecture has on this occasion asserted itself at Burlington House with greater prominence than the domestic and municipal one. In the meanwhile the visible transformation of the streets of London and other large towns is going on with a merry rapidity which will leave to our children something to study, something to admire, and much to wonder at.

THE THEATRES.

THE production at the Vaudeville Theatre of a new play called *The Guv'nor* has, we may hope for the sake of Messrs. James and Thorne, broken the run of ill-luck which has seemed for a certain time to afflict them. For the sake of dramatic literature, it would be impossible to hope that the piece should meet with success; but, inasmuch as success is not always proportionate to literary or dramatic merit, and as the piece gives Mr. James an opportunity for showing us a really admirable piece of acting, it is quite possible that it may meet with an amount of favour which in itself it certainly does not deserve. Its production, besides providing Mr. James with the opportunity spoken of, has enabled Mr. Albery to present himself again before the public in the character of an injured and "unfortunately helpless author." The well-known and ingenious writer who contributes a weekly article on "The Theatres" to the *Daily News*, observing that a certain mystery seemed to hang about the origin of *The Guv'nor*, went on to say that "certain eccentricities in the conduct of the story and in the style of the dialogue recall so strongly some of Mr. Albery's farcical comedies, that, if *The Guv'nor* had simply been produced anonymously, we should have

felt little hesitation in ascribing it to the author of *Two Roses*, *The Spendthrift*, and *Jacks and Jills*." Mr. Albery on this wrote to the *Daily News* to say that he "knew no more of the play than your critic appears to know of candour and good-nature"; and he continued this part of his letter with as much wisdom and good taste as he displayed when his unfortunate play *Jacks and Jills* was produced. From this, however, he proceeded to what he justly describes as a "matter of far more public importance." It seems that on the first night of *The Guv'nor* certain of the audience displayed their disapprobation of the first act of the piece, and were promptly removed, on what precise grounds we have yet to learn, by policemen. According to Mr. Albery's view, and, it may be presumed, according to that of the management also, these persons were "systematic obstructors" who have assembled on various occasions before, and who will, "no doubt, assemble again and again if the gentlemen of the Press neglect their simple duty, which is, instead of encouraging these small iconoclasts, to refuse to criticize any play that has not been fairly heard." This, it will be seen, suggests an entirely new and somewhat onerous duty to be undertaken by "the gentlemen of the Press." They will first have to determine whether the play has been "fairly heard" or not, a question which the management of the Vaudeville appears to have determined with startling rapidity and certainty; and they will then, it is to be inferred, if it has not been "fairly heard," have to return and hear it again, unless indeed Mr. Albery would like to do away with criticism altogether. But, in truth, the suggestion contained in Mr. Albery's letter that there is a gang of "small iconoclasts" (breakers of the images of such saints as Mr. Albery and the author of *The Guv'nor*), who devote themselves to attending *premières* with a preconceived determination to hiss, is, on the face of it, ridiculous. The bulk of an audience is quite as quick to discover an organized opposition as an organized *claque*; and, although some very faulty plays have been known to succeed, we can remember no instance of a really good play having been damned. Of course a bad play may be rendered tolerable by the excellence of the acting, just as a good one may be injured by its incompetence. If *The Guv'nor* does succeed, it will certainly not be due to the inherent merit of the play. The taste and tone of this ill-conceived and ill-written production are exactly what might be expected from its title. Its construction is made up of a long-drawn-out series of flimsy and farcical misapprehensions, the notion of which is well-worn and old enough, while one chief element in the play recalls Acosta's description of the Mexican theatre, in which "the deaf people answered at cross purposes; those who had colds by coughing, and the lame by halting." One of the principal scenes in *The Guv'nor* answers exactly to this description. Mr. James represents a deaf man, Mr. Thorne a man with a singularly painful stutter, and the two hold a long dialogue, which of course leads to various blunders. This is a strangely poor device, but not more poor in quality than is the greater part of the play. As has been said, its chance lies in the skill of the acting, most of which is satisfactory, while Mr. James's representation of the deaf boat-builder is excellent. The deaf look and manner, the odd and not unpleasant laugh, the rough heartiness mixed with a cranky temper, are all given with singular truth and skill.

The Danites has moved from New Sadler's Wells to the Globe, where it seems to be as successful as ever; and its place has been taken at Sadler's Wells by Mr. Saker's arrangement of the *Midsummer Night's Dream*, the chief point in which is that all the fairies are played by children. The idea is graceful and ingenious, and is, on the whole, very well carried out. One of the children, Miss Addie Blanche, who plays Puck, displays real talent. The grouping and scenery are very well devised; the music would be better if it were confined to Mendelssohn, and to Mendelssohn's music composed for the play. The "Pilgrims' March," for instance, from the Italian symphony, has no relation to the *Midsummer Night's Dream*. The whole performance, however, has much novelty and attraction, and a word of praise is due to Mr. Saker's edition of the play, the few notes to which are very well arranged.

At the St. James's *The Ladies' Battle*, followed by *A Regular Fix* with Mr. Kendal's lively performance of Hugh de Brass, has been reproduced. Mr. Kendal's performance of Gustave de Grignon is clever and careful, but not altogether, it seems to us, in his happiest vein. Of the long speech about the fire, of which M. Got made so much, Mr. Kendal makes but little, and he seems all through to miss to some extent the comedy of Gustave's double nature. Mr. Hare plays Montrichard admirably; and Mrs. Kendal is almost, if not quite, at her best as the Countess. The actress would do well to avoid certain tricks of enunciation. The *o* in "offence," for instance, cannot possibly be an open vowel; nor is it usual to lay stress on the first syllable of "console." Mrs. Kendal's acting, however, is full of good points, among which we may specially mention her first discovery of the fact that she and her niece are both in love with Henri. The situation is in itself not very pleasant. Mrs. Kendal lends it both pathos and dignity.

The *Upper Crust* at the Folly, with Mr. Toole's singularly amusing representation of Doublechick, is now preceded by *Hester's Mystery*, a little piece by Mr. Pinero, one of the most skilful and versatile of our younger actors. The framework of the piece is slight enough; but it is not only the author's stage-knowledge which has enabled him to make it attractive and successful. There is real freshness in the idea of the characters, and the writing throughout is pleasant, humorous, and unaffected. Miss Johnstone and Mr. Shelton distinguish themselves much respectively as a shrewish farm-mistress and an old farm-labourer, and praise is due to Mr. Westland for his rendering of a sneaking master of an Academy for Young Ladies.

It is hardly possible to guess exactly what cause, or combination of causes, may have prevented the appearance at the Gaiety of the Palais Royal company from making thus far so much impression as it might fairly have been expected to make upon English playgoers. The plays and the acting are of their kind first-rate, and they belong essentially to that kind which, in the shape of mutilated and inartistic "adaptations" in the English language, has found much favour with one class of London audiences. Possibly the fact that neither the French authors nor the French actors paint with so fat a brush as the English adapters and players may have something to say to the matter. This suggestion, of course, so far as writing is concerned, applies only in a special way. There are certain Palais Royal pieces which have not been licensed for performance in London, and which it would have been indeed impossible to license. But if a *risqué* piece of dialogue in a Palais Royal piece is compared with its English "adaptation," it will almost invariably be seen that what the French suggests, the English insists upon; a fact which may be to some extent due to the difference of the two languages. This is, of course, more or less an open question, as is the one already suggested as to the reason of the comparative emptiness of places which have been seen crammed full at French representations making higher demands on the intelligence than those of the Palais Royal company. Possibly the bulk of former audiences were attracted, not by any knowledge of the French tongue or any true appreciation of acting, but by a vague feeling that it was "the thing" to go and see a particular player, just as it might be, and has been, "the thing" to go and see a particular dwarf. It is, we fear, only too probable that fashion, which may hit by chance upon the right thing, but which has little real taste or knowledge to guide it, has acquired a vast influence on the fortunes of playhouses and plays. This, however, tends to the consideration of a wider question than that of why the Palais Royal company have not made so great a hit as they might have been expected to make; a question which may be answered perhaps in a tolerably simple way. The number of English playgoers who know or care for pieces essentially "Parisian" is comparatively small, a fact which was sufficiently marked last year by the want of appreciation of that charming piece *L'Etincelle*. Most of the people who do know and care for such pieces have already seen many of them given at the Palais Royal with casts which they may prefer to those now offered them. The fear of disappointment has a strong influence in determining people for or against going to see, with an altered cast, a play which they have once found delight in. Probably the coming appearance of Mme. Chaumont may make a difference in this matter. Meanwhile the performances of the Palais Royal troupe have given M. Sarcey an occasion for writing an article on their theatre in the *Nineteenth Century*, which has great interest for all students of stage affairs. In the course of this article M. Sarcey writes that MM. Meilhac and Halévy's *Tricoche et Cacolet* "imported into healthy French mirth that species of wit we have been unable to designate in our language otherwise than by the word *humour* borrowed from you." Here we are at one with M. Sarcey. The piece is an excellent instance of what can be done by extravagant and yet carefully artistic fooling on the part of both authors and actors; for, although it is practically a farce in five acts, it never flags. M. Hyacinthe is still inimitably droll as Le Duc Emile, as in a more quiet fashion is M. Lhéritier in Vander Pouf; and the parts of Tricoche and Cacolet, formerly filled by MM. Brasseur and Gil Perez, are capitally taken by MM. Milher and Calvin. Both are "disguise" parts, and the actors' skill in the assumption of various odd characters is striking. The *voyou* scene is in this way particularly good, although M. Milher's pronunciation is less true to the nature of the Parisian *voyou* than was M. Brasseur's. What, however, is most remarkable in the whole performance is the highly finished art which is brought to bear upon scenes and situations which easily lend themselves to mere buffoonery.

Accounts have appeared in various quarters of *Garin*, a play to be soon produced at the Théâtre Français. A contemporary critic, writing of this, observes with great truth that the Français will in this make "a rather decided incursion into the realms of melodrama." What, so far as we know, has not yet been observed is that the leading idea of the piece is identical with the leading idea of M. Zola's revolting and ignoble story *Thérèse Raquin*.

REVIEWS.

KEITH JOHNSTON'S GEOGRAPHY.*

THE publisher of this work is fully justified in speaking of the premature death of the author as an event much to be regretted in the interests of geographical science. He had fallen a victim to

* *A Physical, Historical, Political, and Descriptive Geography.* By Keith Johnston, F.R.G.S., late Leader of the Royal Geographical Society's East African Expedition. London Geographical Series. London: Stanford. 1880.

the climate of Africa, and to the hardships incidental to explorations in that continent, before the proof-sheets of the volume could reach him at Zanzibar. It has been revised, therefore, by Mr. Bolton and Mr. Drew, and we may fairly conclude that it makes its appearance in a form as free from errors as it could well have been if the writer had lived to complete his task.

The general excellence of the work will probably be acknowledged by all who may take it up with a power of forming a competent opinion on the subject. There is nothing especially striking in its plan, nor does it by any extraordinary merit in its execution leave all recent geographical treatises for the use of moderately advanced students altogether in the shade. It consists of three sections, the first being a sketch of the historical progress of geographical discovery during the last three thousand years; the second treating of the relations of the earth to the solar system, and of their bearings on the life and fortunes of mankind; the third giving a detailed description of the several countries of the world, so far as we have knowledge of them at the present time. In each of these sections we have a large amount of sound information carefully arranged; and if in each of them we also find defects of which the author, had he lived, would probably at no distant day have become conscious, the false impressions and blunders which by some means or other crop up almost everywhere are here, we gladly acknowledge, in most cases pointed out and corrected. The correction might sometimes have been made more forcibly and trenchantly; but at all events it will be the fault of the reader if he does not learn that Turkey and Austria are names of an extremely different kind from England and Switzerland, that some existing geographical arrangements are not absolutely just or politic, and that deeper causes are at work modifying them than those of which diplomatists are commonly aware.

In his historical sketch more particularly Mr. Keith Johnston deals a heavy blow at the worship of the modern map; and for practical purposes, perhaps, this may be the most valuable portion of the work. The twelve chapters into which it is divided are accompanied each with a map, exhibiting the full extent of geographical knowledge attained at the time which it represents. These maps are all drawn to the same scale, and in each the discovered portion is separated from the unknown by a skirting of cloud which covers the rest of the plate with a uniform neutral tint. The student can thus see at a glance what amount of geographical knowledge was possessed by Herodotus or Thucydides, Strabo or Ptolemy, Marco Polo or Columbus. This arrangement leaves only one thing to be desired. The first map exhibits the parts of the world known to Greek explorers shortly before the Peloponnesian War; but it exhibits them under the accurate forms which are the result of modern research aided by exact scientific observations. To enable the student to realize the conditions under which the geographical knowledge of the ancients was acquired, each map should be accompanied by another showing the conceptions of the earth and its parts entertained at each stage in the growth of the science. He would thus see the strange distortions of form, even of the best-known countries, which were indeed inevitable in the absence of all means of scientific measurement, and which are often far more exaggerated in the maps of later than of earlier geographers. He ought, in fact, to know that in the old conceptions there was distortion almost everywhere—that the configuration of sea coast was never given exactly, and that the mistakes with regard to the sources and the course of rivers were as serious as they were frequent; and this is precisely what he would learn from the series of maps illustrating Mr. Bunbury's *History of Ancient Geography*. In our remarks on that work (*Saturday Review*, March 6 and April 3, 1880) we spoke of the mischievous effects of our modern method of reading the historical or geographical writings of the old world under the impression that the ideas then held of the configuration of the earth and its parts were, so far as they went, the same as our own. This impression is the more likely to be strengthened by the series of maps given by Mr. Keith Johnston, as, for the most part, he takes no notice of the blunders, great and small, made by the ancient geographers. His readers could not, for instance, learn from his pages the relative proportions of the island of Ceylon and the Indian peninsula, and the shape and size of the easternmost parts of the Asiatic continent as they were present to the minds of geographers during ages anterior and subsequent to the Christian era. In this respect, and in some others, Mr. Keith Johnston's work can scarcely be said to do more than point the way to what may be done hereafter. Something might have been said, not only of the strange mistakes and confusions of ancient observers, but of the almost total dearth of geographical knowledge in the prehistoric ages. A few lines only are given to this matter; and in these the author speaks of the views of the world accepted by the Greeks of Homer's time, although Thucydides is careful to tell us that neither in the Iliad nor in the Odyssey have we any Hellenes, except the scanty tribe which followed Achilles from the valleys of Phthiotis. What he adds as to the way in which they distributed the supposed surface of the earth beyond the portion known to them is true enough; but it would have been well to say that they filled the space of which they had not personal experience with places which were purely imaginary, and that no good can come of attempts to determine the latitude and longitude of Æaea, Thrinakia, Phaeakia, and Læstrygonia. So, again, when we are told that "the germ of the system which bears the name of Copernicus, the astronomer of Thorn in Prussia, 1473-1543, seems to have existed already in the schools of ancient Greece," the objection lies more against the form of the expression than against the thing said. It implies that in all the Greek schools (that is, among the Greek astronomers and geographers of each successive age) there were always some who held opinions not favourable to the universally received geocentric system; but this statement would not be true. It would probably be more near to facts to say that Aristarchus of Samos was perhaps the only astronomer who definitely propounded the heliocentric scheme as the only adequate explanation of the phenomena of the outward world. Of the two facts connected with the life of the Samian geographer, it is hard to say which is the more astonishing. He enunciated, as Sir Cornewall Lewis remarked, a system which is in all points that of Copernicus and Newton, except that he did not define exactly the principle of gravitation; and the system which he propounded was, so far as we can see, unanimously rejected by the astronomers of his own time as well as by those who came after him. That he actually propounded this system or hypothesis, if we prefer so to call it, there can be no doubt, for our knowledge of the fact comes from the testimony of an adversary. Describing his hypothesis with a strange exactness, Eudoxus of Cnidos gives an account of the opinions or theories of Aristarchus as the wild dreams of an enthusiast; and the theories or dreams of Aristarchus are the universally accepted truths of the present day. We can but content ourselves with saying that discoveries which, however wonderful in themselves, fail to affect the subsequent history of thought, are practically no discoveries at all; and that this remark applies with special force to the sciences of geography and astronomy. That Norwegian explorers discovered America, and were well acquainted with some portions of it centuries before the birth of Columbus, there is now no question; but their discovery led to nothing, and had no more to do with the considerations which determined the great adventure of the Genoese navigator than the speculations or arguments of the Samian astronomer had to do with those of Copernicus or Newton. It is of course possible that Aristarchus, who, in whatever way or by whatever means, was enabled thus to anticipate the discoveries of distant ages, might, had he attempted the task, have shown himself by no means the equal of Eratosthenes in determining the magnitude of the earth. The reasoning which led the latter to conclude that the distance between Syene and Alexandria must be a fiftieth part of the earth's circumference was surprisingly exact; and Mr. Keith Johnston rightly gives him "the credit of having first applied a true principle for the solution of the problem of measuring the earth."

The least valuable chapter of Mr. Keith Johnston's section on physical geography is that which is entitled "Peoples of the World; Natural, Religious, and Political Systems"; and here, also, the fault lies chiefly in an inexactness of language for which his remarks on events in the history of the pre-Christian world do much to prepare us. In speaking of the geographical knowledge of the fourth and fifth centuries before the Christian era, he tells us that in the time of Xenophon "civil wars had broken out among the States of Greece, and soon after the date of the battle of Cunaxa the Spartans gained the ascendency over the Athenian State which had been the ruling one at the time of the Persian invasion." "These troubles," he adds, "gave occasion for the interference of Macedonia, a State which lay to the north of Thessaly, on the outskirts of the Greek nations, and which had recovered its independence of the Persians after the battle of Platæa." Whatever may have been the impression on the author's mind, it is clear that such language as this can only in a greater or less degree mislead his readers. The great lesson taught by the history of the Hellenic tribes and cities is that there never was an Hellenic nation; hence a war between Athens and Sparta was no more a civil war than would be a war between Englishmen and Frenchmen. It cannot with any accuracy be said that Athens was the ruling Hellenic State at the time of the Persian invasion; it cannot even be maintained that at that time Sparta, with its Dorian confederation, had any serious fears of the Ionic confederation of which Athens was the head. It is even more unfortunate to use language which implies that Macedonia (which can scarcely be said to be due north of Thessaly) was an Hellenic State, in any sense which left their claim to the title unchallenged. It is not more accurate, in speaking of "the extreme contrast to the condition of savage communities . . . reached in the orderly association of highly civilized peoples for intercourse, government, and mutual protection," to assert that "the highest in rank and importance of such associations of men are those which are termed *Empires*." The reader may by such phrases be led to lump together the Roman Empire with the so-called Austrian, or the French and Turkish Empires, and to believe that all have a higher rank and importance than the kingdom of England, Denmark, or Portugal; but he cannot be led by them to form a true idea of the way in which the spurious empires have sprung up, and how they differ from the real Empire, which came to an end early in the present century, and which may be legitimately said to have been revived when the Imperial title was conferred upon the Prussian King in the halls of Versailles. The description of a limited monarchy is not more happy. In this form of polity, we are told, "the sovereign represents the will, the executive; the aristocracy, the mind of the deliberative assembly; the representatives of the people, the suggestive element."

It is unnecessary to criticize, and it would perhaps be invidious to notice, expressions which must at the least be considered unfortunate; and our chief reason for noticing them is that the same inaccuracy may be traced through the descriptive sections of the

work. Mr. Keith Johnston is well aware of the nature of the Sultan's position in Europe; and, although too much perhaps is said of "Turkey," he has no hesitation in saying that the Turk "seems destined to be put out of Europe by the way he came." The portions of European soil already wrested from his dominion are carefully noted; but it is a little puzzling to be told that the remaining portions of the Balkan peninsula which have been left for the present under his yoke belong to "Turkey Proper." But whether in the East or the West the empire of the Turk is for Mr. Keith Johnston a decaying one, and his government is weak and corrupt. With this description we have no reasons for quarrelling; but it is impossible to forget that the Turkish Empire is not the only empire in Europe which consists of elements not altogether homogeneous. The Austrian Empire has to contend with some difficulties not less formidable than any with which the Sultan has to deal; but of these difficulties, of the antagonism of the several populations over which the Hapsburg House is sovereign, of the straits to which Austro-Hungarian statesmen confess themselves reduced, the reader will learn nothing from Mr. Keith Johnston's pages. He will not even learn from them that there is any opposition of interests and aims between Hungarian and Slav.

Large allowance must of course be made for the conditions under which a writer works who undertakes to produce anything like a complete geographical treatise within a space of less than five hundred pages. But the defects which we have noticed rather add to than lessen the bulk of the book; and in the historical section at the least some space might have been saved if the distinctions between nations and artificial governments had been given more exactly. It is quite unnecessary in a work of this kind to enter into controversies. It is, in fact, impracticable to do so; and Mr. Keith Johnston had a full right to say that after the capture of Jerusalem Omar "caused the mosque which bears his name to be built over the site of the Temple of Solomon," if he had satisfied himself that Mr. Fergusson's theory is unsupported by evidence. Here we believe that his assertion is borne out by facts; and even the statements to which we have objected may be regarded rather as inaccurate than as wrong. We could wish that they were more exact, for they are blemishes in a work of great value, which, by giving a fresh impulse to geographical teaching, cannot fail to produce good fruit.

LIFE OF EDGAR ALLAN POE.*

WERE the labour that the author has bestowed on a book the proper measure of its value, this Life of Edgar Allan Poe would undoubtedly stand high in our estimation. There can be no question that with Mr. Ingram it has been a work of love, on which he has spared neither time nor trouble. Unhappily judgment has been wanting, and judgment in such a case is second, and only second, to industry. He is so much interested in his hero that he loses all sense of proportion, forgetful of the fact that in the unhappy wasted genius whom he describes the world takes but a moderate interest. Poe has, likely enough, as Mr. Ingram maintains, been slandered; but it surely does not require two volumes to uphold his injured character. It would seem that his champion had already done a good deal in his defence. "It was due to myself," writes our author, "due to the public, and due to the memory of a much maligned man, that the short vindicating 'Memoir' prefixed to my edition of Poe's Works in 1874, and my essays on his Life and Works—published before and after that sketch—should culminate in such a work as this." Whatever may have been due to Mr. Ingram and to the poet, the public certainly would have been satisfied with a culmination at a much lower height. We wish that our biographers could once for all get it well into their heads that the only thing that is really due to the public is that they shall never be bored with the hero of their book. Now Mr. Ingram goes into details that are only to be rivalled by the modern Shakspearian Societies. He thinks it needful to follow Poe wherever he can trace his course, and to record whatever he has discovered that he did, even though what he did may now be of no interest to any one. Who can care for such passages as the following? and of such passages there are far too many to be found in these two volumes:—

> In a notice of the "Vicar of Wakefield," described as "one of the most admirable fictions in the language," some admirable remarks upon the subject of illustrating books are made, and various characteristic utterances—utterances as yet not reproduced—are given, upon Heber, Walpole, "Christopher North," and other more or less known writers. The February number of the magazine contained an article on Brainard, one of the pioneers of American literature, and a fresh and eulogistic review of "Barnaby Rudge," whilst the number for March included, amongst minor notices, analyses of new books by or about Lever, Longfellow, Howitt, and Brougham.

To Mr. Ingram's want of judgment is unfortunately added a singularly bad style. He must, we can well believe, be deeply read in American literature, for he has caught most of the worst faults of American writers. As we read his narrative, we constantly hear, as it were, the intonation of our cousins on the other side of the Atlantic. In fact, full justice will then, and then only, be done to his book when it is read aloud in a New England parlour. In describing the story that Poe wrote about his school days in England, Mr. Ingram says:—"Many of the features are reproduced with a graphicality unequalled anywhere, save in the parallel records of Balzac's 'Louis Lambert.'" We will defy any of our readers to read this passage aloud and not to fall at once into a nasal twang. Poe was a swimmer, and so Mr. Ingram records one of his "dangerous exploits in natation." He fell in love with a young lady; but she died soon, and "was entombed in a neighbouring cemetery." Later on in the book, when Poe lost his wife, we are told that "the deceased lady was entombed in the old family vault of the Valentines." At this time the unfortunate poet was in great poverty, but a kind lady came to the help of the wretched family. "If it had not been for Mrs. Shew," wrote Mrs. Clemm (Poe's mother-in-law), "my darling Virginia would have been laid in her grave in cotton. I can never tell my gratitude that my darling was entombed in lovely linen." Another lady whom Poe admired is still living. "It is also," writes our author, "within the memory of the lady that her young admirer drew beautifully." The poet started for Europe, as some said to take part in the Greek War of Independence. "It is very problematical whether he ever reached his presumed destination." In his poetry are found allusions to Greek scenery; "but with a mind of such identificative power as was Poe's, these coincidences cannot be allowed to count for much." We are told that Poe chose "to locate Purgatory" in a certain star, and we find that "it is claimed" that he wrote some of his verses at a mysterious interval of his life. One of his tales is said to be "the most representative record of its author's idiosyncrasies"; in another tale is "discoverable an acumenical (*sic*) analysis of a monomania." We have "idiosyncrastic (*sic*) verses," and "idiosyncrastic (*sic*) manner." Poe wrote a story called *Berenice* for some magazine. The criticism that the editor passed on it is called by Mr. Ingram "the editorial idea of *Berenice*." The porch of the cottage in which the poet lived becomes "a floral bedecked porch." With a certain year "was inaugurated the most brilliant epoch of Poe's literary career." He became the proprietor of a journal, and "inaugurated his assumption of the sole control of the publication by the commencement of an absurd disputation." But in his Americanisms Mr. Ingram is, we must admit, beaten by at least one citizen of the United States. Nearly thirty years after the poet's death the Poe Memorial was set up in the cemetery in which he lies buried—entombed, we should say. After the proceedings had been "inaugurated" by music, Professor William Elliott, jun., delivered an address, "recounting the history of the movement that culminated in that day's celebration." What is the science or art that this gentleman professes we are nowhere told. Possibly he is a Professor of undertaking. With such a supposition there is certainly nothing inconsistent to be found in the following passage from his address:—

> Another item, which it may not be inappropriate to record in this historical compend, I will now mention, namely, that George W. Spence, who officiated as sexton at the burial of Mr. Poe, is the same person who, after the lapse of twenty-six years, has superintended the removal of his remains, and those of his loving and beloved mother-in-law, Mrs. Clemm, and their reinterment in the lot in which the monument now stands.

In spite of all the faults of this Life—and they certainly are abundant enough—there is nevertheless much in the two volumes that may be read with interest. How far Mr. Ingram is successful in defending Poe from the charges that have been brought against him we cannot pretend to say. We fear, however, that his strength of feeling is likely at times to turn him—unconsciously, of course—from a biographer into an advocate. It would be needful, in order to arrive at a sound judgment, to examine carefully the statements that have been made on the other side, and for that labour we have neither time nor inclination. That Poe was a most unhappy man, and that his unhappiness was by no means all his own fault—that we can allow. That he was a good man, or even a man who, in spite of grievous faults, was still lovable, Mr. Ingram fails to convince us. Without doubt he was a man of genius, and, like so many other men of genius, he was miserably ill-paid for the good work that he did. For his poem of "The Raven" he received, it is said, just ten dollars. Many a man makes as much, and even more, every week by an hour's attendance as Director at the Board of a Gas Company. Yet it is a poem that is to be found in almost all modern collections. "In the course of a few weeks it spread," says Mr Ingram, "over the whole of the United States, calling into existence parodies and imitations innumerable, and indeed creating quite a literature of its own." Mrs. Browning, then Miss Barrett, wrote about it:—"This vivid writing! this power *which* is felt! . . . Some of my friends are taken by the fear of it, and some by the music. . . . Our great poet, Mr. Browning, is enthusiastic in admiration of the rhythm." There is little cause for wondering should a man who can do as much as this, and whose payment is so miserable, fall into wild ways of living, and into fierce abuse of his fellow-men. Till a way can be found to reward fitly the work of men of real genius, we shall always see instances of great powers ignobly wasted. It may be said that such men as Savage and Poe—between whose lives no small likeness is to be found—could in no case be brought into decent ways of living. No one, however, can tell how violent is the revolt that is raised in the minds of men like these by the sense of neglected merit, and by the sight of the good things that far too commonly fall to the lot of those whom, with justice, they utterly despise. These unhappy men of genius ought, no doubt, to know, in the words of one of the greatest among them, that "prudent, cautious self-control is wisdom's root." But self-control is not so easily cultivated in a mind that is tormented by a burning sense of injustice. Men of

* *Edgar Allan Poe: his Life, Letters, and Opinions.* By John H. Ingram. With Portraits of Poe and his Mother. 2 vols. London: John Hogg. 1880.

vast fortune could surely in no way more wisely or more honourably expend some small part of their wealth, than in securing for such men the certainty of, at all events, a decent maintenance. Among all the titles, all the decorations, all the honours, that were conferred on the wealthy men of the last century, could any one have won for himself and his descendants a higher title, a more becoming decoration, a greater honour than would have been earned by granting a modest but certain income to Goldsmith, or Burns, or Chatterton? With these three men Poe certainly is not for a moment to be compared. He is as much below them in genius as in moral worth. Still, with all his faults, he was, as we have said, an ill-used man, for he did for the world vastly more than the world did for him. It may be answered that he had his benefactor, and that, through his own folly or vicious life, he lost him. He had been left an orphan when a child of two years old, and had been adopted by a benevolent gentleman. When he was a young man he had a violent quarrel with this gentleman, and was forbidden his house. He was, we must not forget, a man of a strong but wild character, one likely enough in the outset of life to go very wrong. He had, however, this great merit in his after years—he was not afraid of work, and he did a great deal of very hard work, getting in return for it very pitiful pay. Perhaps in later years, had he been sure of a decent competency, and had he not been engaged in a never-ending struggle to keep the wolf from his door, he might have settled down into a decent and a happy mode of life.

Of this, however, we feel by no means certain; for in his character there was, we are convinced, in spite of Mr. Ingram's laboured defence, a very bad side. The men of letters among his countrymen almost to a man looked upon him with the greatest distrust. Mr. Ingram attributes this to the severity of his criticisms:—

> In the December number of the *Messenger*, at Mr. White's instance apparently, he commenced the system of literary scarification—that crucial dissection of bookmaking mediocrities—which, whilst it created throughout the length and breadth of the States terror of his powerful pen, at the same time raised up against him a host of implacable, although unknown, enemies, who henceforth never hesitated to accept and repeat any story, howsoever improbable, to his discredit.

When, says Mr. Ingram, one of Poe's friends published ten years after his death an article in his defence, "not a single paper noticed the vindicatory work, 'whereas the whole press of the country seemed desirous of giving circulation and authenticity to the slander.'" Now the Americans are not an ungenerous people. In fact, they have a wonderful aptitude at forgiving their enemies. They are sensitive to criticism no doubt, but chiefly so, we believe, to the criticism that comes from abroad. They are willing even, as we Englishmen are, to hear themselves abused, provided that the abuse comes from one of their own countrymen. Poe may, no doubt, have provoked a number of contemptible writers by his attacks; but it is impossible to believe that they, however much they may have leagued together, can have written him and his character down. "Depend upon it, Sir," said old Bentley, "no man was ever written down but by himself." There were enough honest and able writers in the United States to have enabled Poe, by the warmth and sincerity of their approbation, to forget even a larger swarm of assailants than that which beset him. But he answered abuse by abuse, and sank down to a very low level indeed. In a reply to one of these attacks which Mr. Ingram quotes, Poe calls his assailant a blackguard of the lowest order, whom it would be a silly truism, if not unpardonable flattery, to term either a coward or a liar. He says that there is a striking resemblance between his visage and that of the best-looking but most unprincipled of Mr. Barnum's baboons; and he prides himself on his moderation in not having described on some former occasion the brandy-nose of a Mr. Briggs, who is only one-third described when this nose is omitted. In writing of a third person, he said, "I promptly ordered him to quit the house. In his capacity of hound he obeyed." His arrogance must have rendered him one of the most unpleasant of companions. "My whole nature," he once said, "utterly revolts at the idea that there is any Being in the universe superior to myself." This he said when he was upholding his belief in Pantheism. It is strange that such a man should think it needful to have recourse to romancing to uphold his superiority. "The writer of this article," he once wrote, "is himself the son of an actress, has invariably made it his boast; and no earl was ever prouder of his earldom than he of his descent from a woman who, although well born, hesitated not to consecrate to the drama her brief career of genius and of beauty." When we turn from these high-sounding words to simple truth we find that it is nothing but a piece of impudent brag. Who was his mother's father is not known. "It is believed," says Mr. Ingram, "that he was an Englishman of very good family, though in impoverished circumstances." She was born at sea, and lost her mother at her birth. The father died soon afterwards. "The little girl being left fatherless, as well as motherless, whilst still an infant, was, apparently, adopted by some compassionate stranger and carefully educated for the stage." Such are the facts as stated by Mr. Ingram, and yet he says "It is pleasant to hear her talented son, in the brightest epoch of his own short life, when alluding to his mother's profession, declare—" and then he quotes the fine declaration.

In fact, no one, it is very clear, could trust Poe's word. He was an admirable romancer, no doubt, but his romancing he did not confine to his romances. The letters that he wrote to a Mrs. Whitman and another lady who in this work is always called "Annie" are most discreditable to him, though Mr. Ingram fails to see it. Mrs. Whitman was a sister-poet, with whom he had fallen in love on reading her verses. The reader who makes an accurate study of dates will discover with some amazement that the lady at the time of Poe's mad love for her—for it seemed like madness—was about forty-six years old. She accepted him; and then, dreading his relapse into intemperance, broke off the engagement. "No amount of provocation," he wrote to her, "shall induce me to speak ill of *you*, even in my own defence." It is clear that from her he never received the slightest provocation. Yet at the very time that he was thus writing he wrote to his other correspondent:—"Of one thing rest assured, Annie—from this day forth I shun the pestilential society of *literary women*. They are a heartless, unnatural, venomous, dishonourable *set*, with no guiding principle but inordinate self-esteem. Mrs. Osgood is the *only* exception I know."

There is certainly another side to his character, which we must not pass over. He had married his cousin, who was the only child of a widow, his father's sister. He always gave his mother-in-law a home in his house, and even after his wife's death he made no change. For her support she was altogether dependent on him; and, when he died, it was to the admiration of his genius that she owed such comfort as she obtained in her last years. It is not easy to believe that there was much in common between the author of "The Raven" and the poor woman who found such comfort in the knowledge that her only child was entombed, not in cotton, but in lovely linen. The higher, therefore, is the praise which he deserves. Conduct such as this leads us once more to reflect how, in this man's wild nature, there was that which might possibly have saved him from the waste of his fine powers and the utter ruin of his life. Could he but have received from the world those wages which he had fairly earned, we should perhaps be now reading, not his justification and defence, but the simple narrative of his life.

THE GARDEN OF INDIA.*

THIS book is the production of one of the new race of Civil Servants, who has read and thought much, who is well acquainted with modern literature, who has by service in the Oudh Commission acquired a large stock of facts, and who is evidently well satisfied with himself and his capacity for solving intricate social problems in a few pages. There is, in truth, much that is very provoking in this work. Of the writer's thoughtfulness, ability, and devotion to the interests of the masses there can be no question. But, with his opportunities for going beneath the surface of official existence, he might have told us more of the natives of this fine province. He is perpetually quoting Mr. Mill, or Mr. Herbert Spencer, or "Sordello," or some other modern writer, instead of giving us a few of those rustic proverbs and pithy sayings which he must have heard scores of times. In the whole of his 350 pages he records one native couplet which is neat and pointed, and we would willingly have exchanged divers quotations from English poets for a few more of the genuine and humorous answers given by Oudh cultivators to officers appointed to inquire into their rights and claims. Then Mr. Irwin has fallen into a trick of slily depreciating the motives and characters of those statesmen and administrators who, labouring under difficulties and trials of a different kind from those which now beset our Anglo-Indian servants, still contrived to build up a splendid and solid fabric of empire. It has been said lately that some modern writers have got into a way of disparaging and carping at Macaulay in order to puff their own claims to distinction, and we cannot help commenting on a similar fault in Mr. Irwin. Warren Hastings, for some of his dealings which no one has ever completely defended, is thought by Mr. Irwin to have justified all the acrimonious rhetoric of Burke. Of Lord Cornwallis it is condescendingly said that it is "possible to study the history of our relations with the province during his term of office without feeling any overpowering sense of shame"; a discovery which no doubt must have been a great relief to Mr. Irwin. Lord Wellesley has a long correspondence with Saadat-Ali, and the latter is credited with very much the best of the argument, whereupon the Governor-General, "vanquished in discussion, threw his sword into the scale." Then the same Viceroy is affected with the new disease called "earth-hunger," a term which Mr. Irwin ought to recollect is used by native Mahouts in regard to an elephant unpleasantly out of sorts and in need of medicine. Even Lord Lawrence cannot be allowed the credit of writing his own minutes on a question which of all men he was the most competent to treat. We may remind Mr. Irwin that the salary of the Viceroy is 25,000*l.*, and not 30,000*l.* a year, and he really ought to know better than to designate the nobleman who abolished suttee and first opened out some parts of the public service to educated natives, as "Lord Bentinck." This cannot be a misprint, for he bestows a peerage on Lord William five times in two pages.

And yet this book contains much that is deserving of close attention. There is perhaps no part of the British dominions in India which to the average English householder sounds less unfamiliar than Awadh, Oudh, or Oude, as it used to be written. Sheridan's speeches, Burke's invective, the long-continued misgovernment of the province, the repeated warnings of indignant Viceroys, the annexation carried out by Lord Dalhousie with the

* *The Garden of India; or, Chapters on Oudh History and Affairs.* By H. C. Irwin, B.A. Oxon., B.C.S. London: Allen & Co. 1880.

full consent of the Cabinet in the very last month of his splendid administration, the Mutiny, the siege of Lucknow, the death of Henry Lawrence, the strategy of Havelock, the relief and the final capture, are all commonplaces of English history. Charles Lever had told us in *Charles O'Malley* that

The King of Oude
Is mighty proud
And so were onst the Caysars,
But ould Giles Eyre
Would make them stare
Av he had them with the Blazers.

Mr. Irwin has some extremely suggestive chapters on tenant-right and the tremendous controversy which it was one of Lord Lawrence's merits to have raised, discussed, and settled. To understand the chief points of this question a slight sketch of the history of the province is indispensable. Mr. Irwin gives us neither an index nor a map, and the headings to his chapters are extremely defective. The ordinary reader who is puzzled by the mention of the rivers Gogra, Rapti, and Gumti, to say nothing of the Ganges, or who desires to ascertain the exact position of Faizabad, of the large grazing tracts in the northern part of the province, and of the portion of the Terai bestowed on Jung Bahadur by Lord Canning for his services in the Mutiny, must be content to go elsewhere for accurate information. But it requires no map to endorse Mr. Irwin's paragraphs about the picturesque character of parts of the province. A great portion of the province is no doubt monotonous, like the plains of Hindostan or of Lower Bengal, and Oudh, in climate and appearance, differs but slightly from either of these provinces. It is not so dry as Agra nor so green as Moorshedabad. It has its fair share of hot winds, but it has also swamps or jheels as they are termed, which rise in the rains to the dignity of lakes. That it has no sanitarium or hill station is a fact which Anglo-Indian critics alternately approve or deplore. Oudh has no delightful retreat like Kussowlie or Naini Tal to which a dried-up Commissioner at the beginning of May can remove with his office, to remain there till the first breath of the cold season; and invalid soldiers can only be sent to Landour. On the other hand, officials cannot, on one pretence or another, leave their real work behind them in the plains, and then, according to a popular belief, spend their afternoons in lawn tennis and croquet, at a height, *despicere unde queas alios, &c.* We doubt whether Oudh has any more valid claim to be called the "Garden of India" than parts of Bengal proper. But it has an extent of twenty-four thousand square miles; its population is now in excess of eleven millions, being about four hundred and seventy-four to the square mile; its revenue, from all sources, is more than one million and a quarter; and, though tenanted by warlike castes—who from being loyal soldiers became, in the Mutiny, extremely formidable foes—the annual cost of its military occupation does not at the present time exceed 350,000*l.* But it must not be forgotten that, out of some nine regiments, no less than five are English, backed by five batteries of English artillery.

The history of misgovernment in Oudh has been so widely circulated by Blue-books, Colonel Sleeman's Tour, and other official and unofficial documents, that it would be superfluous to go into any justification of Lord Dalhousie's final sentence on an incorrigible race. The odd thing about these rulers is that their own subjects never would give them the title of kings. From the days of Lord Teignmouth down to February 1856, our King of Oudh in the eyes of his people was only a Nawab, and his province but a *Nawabi*. Mr. Irwin quotes Bishop Heber's Journal and other testimony to support an opinion that, after all, the condition of the province could not have been so bad as is supposed. Plains were sown and harvests were reaped, though the agriculturist drove the plough with a sword by his side and a matchlock over his shoulder; but revenue was usually collected by the King's troops at the point of the bayonet or at the cannon's mouth. To talk of justice, equity, or security of property at any time during the fifty years preceding the annexation, would have been mere mockery. The province was really fed and supported in a large measure by the pay received by men from Oudh who served in our native army, and regularly remitted money to their villages near Faizabad and Sitapore. With the reconquest of the province in 1858 and its Settlement, of course all privileges and exemptions were at an end. The equality of all classes before the law was avowed in proclamations and worked out in practice. But the Mutiny had wrought such changes in public opinion regarding the best system of collecting the revenue, the treatment of natives of rank, the policy of enlisting wealth and position on the side of Government and social order, that it is no wonder if Lord Canning, actuated by the noblest motives, should have resolved on giving to this recent acquisition a Settlement different from what had been thought models for universal adoption in the North-West Provinces and the Punjab. Two or three notorious facts lent a powerful support to Lord Canning's view. In the North-West Provinces society seemed at once to fall to pieces when our rule collapsed. One village engaged in a series of pitched battles against another. New men who as successful usurers and traders had bought old acres were promptly dispossessed by the enraged proprietors whom they had ruined. There was, for a time, no one of greater social standing than his neighbours who could form a rallying point for the partisans of order and law. Not so in Bengal and Behar. Selfish, unscrupulous, and high-handed with their tenantry as were the Landholders created or recognized by Lord Cornwallis, they clearly discerned the solid benefits of the foreigner's rule. With the exception of Koer Sing, who was simply driven into rebellion by an adverse decision of a full Bench of the Highest Court of the Company, no man in Bengal who had anything to lose cast in his lot with the mutineers. Some Zamindars were active on the side of the Local Government, and many showed that quiet, stolid, impassive demeanour before which all rebellion melted away. Bands of Sepoys straggled over the country from Eastern Bengal, to be warned off by the agents of Zamindars, to be refused supplies, to be captured by timid villagers, or to die miserably in the jungles by fever, famine, and wild beasts. With this salutary precedent before him Lord Canning thought it sound policy to recognize in Oudh a race of Talookdars, or "Barons," as it was the fashion to call them, who in the event of a similar crisis should have more commanding influence than the Zamindars of Bengal. We must here note a distinction in Indian official phraseology which might perplex or mislead. In Bengal and Behar a Rajà or Nawab with a big rent-roll, a huge acreage, and an unquestionable prestige, is termed a Zamindar. In Oudh the same personage would be designated a Talookdar. The latter title in Bengal may designate a mere squireen. And in Oudh a Zamindar is a very small proprietor, who may perhaps own a whole village himself but is oftener only one of a co-parcenary community. Impressed with the sort of feeling which leads all Ministries in our own country to convert squires into baronets and baronets into peers, Lord Canning determined to make the Settlement of the revenue, which is the very foundation of the Indian social edifice, with the Talookdar. This class, he argued, was the ancient, indigenous, and cherished system of the country. The rights of villagers were to be protected in some way; but still the Talookdar was to be the prominent feature of the new system. His active rebellion or defection was pardoned; his traditionary privileges and exemptions were to be fostered; he was to get the Star of India, and in some cases had well earned it; he was to try petty revenue and civil cases; and it is not too much to say that he was to be developed into a hybrid between a reformed Front de Bœuf, Sir John Mittimus, and Justice Shallow.

Indian Civil Servants who have to extract the pith of dusty bundles of documents dealing with the past history of some extensive project of education, irrigation, settlement, police, and so forth, acquire great aptitude for picking out the salient points of a huge paper war. And, in justice to Mr. Irwin, we must say that he has given as clear and connected an exposition of the Oudh Settlement and its consequences as English phrases applied to Indian subjects will allow. Of course the policy of Lord Canning was highly applauded at the time. The Indian newspapers, with few exceptions, wrote it up. The partisans of the ryot, or agriculturist, were silenced or were not heard, and it must be admitted that Lord Canning was actuated by the most noble and stainless motives, and that there was much to be said at the time in favour of his view. He had the support of some high civil authorities. He remembered how one province had been violently convulsed, while in another the surface had scarcely been ruffled; and there was hardly any choice between granting an amnesty and restoring the "Barons" to their old position, or else waging a protracted warfare against a swarm of enemies with mud forts, serviceable cannon, and endless retainers. But even before Lord Canning's departure there were signs of official disturbance and commotion; and then began a paper warfare about the claims of tenant proprietors, cultivators at fixed rates, and cultivators at will, which, smouldering during the brief reign of Lord Elgin, burst forth with intense fervour during the administration of Lord Lawrence. All sorts of theories were freely broached. Whether this same tenant proprietor was the backbone of the country and the credit of the Anglo-Indian rule, or whether he was a clog on industry and a bar to progress, were questions freely debated. It was said that he never had any rights, or, if he had, that they had long since perished; that limitation ought to run against stale claims and shadowy proprietors; that, on the one hand, the Talookdars might complain of violated pledges, and would be driven into resistance; and, on the other, that the credit of the English name would be destroyed for ever if the position of some millions of agriculturists were to be coolly sacrificed to a set of men who would use authority as it ever had been used in the East from the days of Nimrod. But there is a Divinity that shapes the rough-hewn ends of Indian history, and a statesman with a special aptitude for a special duty has somehow invariably appeared when wanted. Lord Hardinge's military experience helped him to win Ferozshah. Without Lord Dalhousie's comprehensive genius we should never have had a consolidated Empire at all. It required all Lord Canning's magnanimity to resist the cry for vengeance which, after Cawnpore, went up from a thousand tongues. And other Viceroys besides Lord Lawrence might have perceived the dangerous elements in the Oudh Settlement, and yet have lacked the training that could argue out land questions from the most intricate details to the loftiest principles. The whole story must be studied in Mr. Irwin's pages, in which subsequent experience is brought to bear on the Blue-Books of that time. Something like an equitable compromise was effected in 1866. Proprietary or sub-proprietary rights were not absolutely crushed. Individuals or communities were allowed to give proof that such claims had been kept alive. In some instances they were granted a sub-settlement at a moderate enhancement of rent. To others was conceded, not exactly a proprietary right, but a right of occupancy at a less rate than that paid by their neighbours who were

tenants under contract or at will. In short, a means was devised to reconcile pledges given by a former Viceroy, or by his Lieutenant, with fairness and consideration for the huge mass of agriculturists; and the termination of a long, acrimonious, and dangerous dispute deserves more credit than Mr. Irwin is disposed to give it at the close of his chapter about the Talookdari Policy. The occasional analogies between Oudh concessions and Irish relief will be obvious to all readers.

Like other impulsive writers on whom a theory has fastened its tight grip, Mr. Irwin is extravagant when he begins to construct. His remedies for existing evils would hardly have been approved by any of the controversialists. They would have failed to enlist in their support Lord Canning or Lord Lawrence, the ex-member for Gravesend who was the Chief Commissioner of the Province, and the member for the Kirkaldy Burghs who had been Judicial Commissioner at Lucknow before he was Lieutenant-Governor of Bengal. Mr. Irwin gravely proposes to recognize the State as the sole landlord, and though he would be favourable to middlemen or Talookdars of long standing, he would proclaim a universal tenant-right. Indeed his plan is so cut and dried that he has estimated the cost as well as the time of a special agency to be created for this sole object. For about 2,500*l.* a year he would undertake to provide men who would revise the rent roll of a single district, at the rate of a village a day, excepting Sundays, for which we are glad to see he has an old-fashioned respect. This is "polishing off" with a vengeance. Of the slight difficulties in the way of abolishing landlords or reducing them to the condition of men with a fixed life interest in their properties, he takes no account. It is scarcely necessary for us to argue at length on the impracticability of this scheme. Indian agriculture may need something more than model farms and exhibitions of prize bullocks, and the State may have to interpose and aid Ryots who suffer, in the Deccan from usurers, in Burdwan from fever, and in Oudh from oppression. But we shall not elevate a whole peasantry by eliminating their landlords, and such questions are complicated by grave political and social considerations which the author appears entirely to overlook. The late Bishop Wilson once amazed Anglo-Indians by recommending that, in order to spread Christianity in India, the State should "pension the Brahmans." Mr. Irwin's proposal to "pension" Talookdars is much the same. He has, however, been actuated by praiseworthy motives, and those who recognize the danger arising from a dense population, which is insufficiently nourished in ordinary years and must perish in years of famine unless fed by the State, will find much food for thought in this history of a province, and must concur in the praises bestowed on practical agriculture and improved education.

THE ENCYCLOPÆDIA BRITANNICA.*

THE eleventh volume of the new edition of the *Encyclopædia Britannica* opens, according to the table of principal contents, with "Gout," and ends with "Hippopotamus." One of the earliest articles is by Mr. Thomas Arnold, on "Grail or Grayle, the Holy (Saint Graal, Seynt Greal, Sangreal, Sank Ryal), the name given to the legendary wonder-working vessel said to have been brought by Joseph of Arimathea to Britain." There can be little or no doubt that, as Mr. Arnold says, the correct spelling is Graal. As to the derivation of the word, the writer of the article thinks that the opinion of M. Paulin Paris is satisfactory. According to this, graal is a corruption of *gradale* or *graduale*, the Latin name for a liturgical collection of psalms and texts of Scripture (*quod in gradibus canitur*). "The author of the Graal conception meant by graal or gradale, not the sacred dish (escuelle), but the mysterious book revealed to the supposed hermit of 717, in which he finds the history of the escuelle." The word, however, became popular in the sense of a shallow bowl, and there is a passage, if we remember rightly, in an early writer which joins together "pyxes, grails, and other Popish pelf." M. Fauriel derives the word from *grazal*, old Provençal for cup, which, however, according to the article in Ducange, seems to be of Armorican origin, and "anyhow M. Fauriel has not proved its use in the sense of cup at a period earlier than the rise of the Graal legend." Mr. Arnold's terse account of all that can be ascertained concerning this legend is excellently done. "The Graal" is closely followed by Mr. Sayce's article on "Grammar," at the end of which we are glad to find the writer asserting that the system, popularized, we believe, by Mr. Prendergast, of learning foreign languages is the one to be most approved. There can be little enjoyment or interest in beginning with the dry bones of grammar. "The unit of speech is the sentence; and it is with the sentence, therefore, and not with lists of words and forms, that the pupil should begin." When once a sufficient number of sentences has been assimilated they can be easily analysed, and their component parts shown in their bearing on each other. In fact, a foreign language should be learnt just as we have learnt our own tongue, and grammar must be regarded not as a piece of dead mechanism, the arrangement of which is regulated by artificial rules, but as a living organism with a history and reason of its own.

The long and important article on Greece is divided into Geography, History, Language, and Literature. The first of these sections is treated by Mr. Rae, the second by Messrs. Jebb, Tozer, and Donaldson, the third by Professor A. S. Wilkins, and the last by Messrs. Jebb and Donaldson. It is scarcely necessary to say that the subjects could not well have been entrusted to more capable hands. Passing over an article on "Greek Fire," which is interesting, especially when taken in connexion with a following one on "Gunpowder," we come to "Robert Greene," which, oddly enough, does not figure in the principal contents, but is signed with Professor A. W. Ward's initials. We find ourselves in disagreement with one cardinal point in this article. Professor Ward, with whose not unfavourable judgment on the attempted humour of Kenrick's wretched *Falstaff's Wedding* our own opinion was on a former occasion at variance, says that Greene's "comic humour is undeniable" in general, and adduces several particular instances to support this view. On one of these, the character of Slipper in the *Scottish Historie of James IV.*, it may be enough to join issue with the learned writer of the article. "The fooling by Slipper, the clown of the piece," he writes, "is unexceptionable." Here is an instance, by no means unfairly chosen, of this admirable fooling. Slipper being given drink, is asked, "How lik'st thou, this?" and makes answer, "Like it, mistress! why this is quincy quarie pepper de watchet, single goby, of all that ever I tasted. I'll prove in this ale and toast the compass of the whole world. First, this is the earth—it lies in the middle, a fair brown toast, a goodly country for hungry teeth to dwell upon; next, this is the sea, a fair pool for a dry tongue to fish in; now come I, and seeing the world is naught, I divide it thus; and because the sea cannot stand without the earth, as Aristotle saith, I put them both into their first chaos, which is my belly, and so, mistress, you may see your ale is become a miracle." A following speech even more laboured and devoid, as it seems to us, of what Professor Ward calls "true farcical fun," is unquotable. Both are good specimens of Slipper's humour.

An article by Mr. F. A. Butler, on Guaco, Huaco, or Guao (also Vejuco and Bejuco), contains a statement which, if proved by tests to be accurate, has the highest importance. Guaco is a generic term for various Central and South American and West Indian plants "in repute for alexipharmic and curative virtues." The Indians of New Granada say that these growths acquired their name from the cry of a certain kite which by means of this cry attracts the snakes that serve it for food; and they believe that the virtues of the plant were discovered by the observation that the kite always ate some of the leaves before encountering its prey. There have been disputes about the true guaco, owing to the Indians' loose nomenclature, for they apply the word to "any twining plant with a heart-shaped leaf, white and green above and purple beneath." What is most commonly recognized in New Granada as guaco, Mr. Butler writes, would seem to be the *Mikania guaco* of Humboldt and Bonplan, a climbing composite plant of the tribe *Eupatoriaceæ*. The efficacy of guaco against poisoning by snakes, "first carefully experimented on by Mutis about 1787, has been frequently since attested; and in parts of New Granada much infested by those pests a kind of inoculation with it is practised by some persons, the juice of the leaves being applied, at intervals of a fortnight during several months, to incisions in the hands, feet, and sides of the chest, two large teaspoonfuls of the same juice having beforehand been administered internally." It has been said that the Indians of Central America, having taken guaco, can handle the most dangerous snakes with impunity; and Humboldt observed the *Coluber corallinus* shrink from a stick steeped in guaco. All this seems to hint that the tales of the Psylli, as—if we are not mistaken—Mr. Gosse suggested in the *Romance of Natural History*, may be true; and that this drug, which is said to be highly recommended for the treatment of many diseases, as well as for the prevention and cure of snake-bites, may have unusual value. The question is obviously more fitted for discussion in a scientific medical review than in these columns; but we trust that further information may be forthcoming with regard to the article from which we have quoted. Soon after this comes an article on Guido (of Arezzo), which reminds us of the enormous improvements which the Benedictine or Camaldulian monk effected in musical notation. "It is well known," says the writer of the article, but it is perhaps worth recalling to the recollection of our readers as a curious fact, that the *ut, re, mi, fa sol, la*—in all probability introduced by Guido—were the first syllables of the first six lines of a hymn to John the Baptist:—

> *Ut* queant laxis *re*sonare fibris
> *Mi*ra gestorum *fa*muli tuorum,
> *Sol*ve polluti *la*bii reatum
> Sancte Johannes.

The articles on "Gun-making and Gunnery," by Colonel Maitland, and on "Gunpowder," by Major Wardell, are full of interest. Colonel Maitland, beginning with the curious "hand-gun," of which a figure is given, goes on to write an exhaustive account of the progress of the science of gun-making, both in small-arms and in ordnance, up to the present date. "Gunnery" is of course in parts highly technical, but is written with much clearness. In the article "Gunpowder," Major Wardell, quoting from his full knowledge of all the authorities on the subject, admits that much obscurity hangs over the early history of gunpowder, but thinks it most probable that its employment as a propelling agent originated among the Moors or Saracens, and spread from them "eastward as well as northward into Europe." Any one who studies Major Wardell's article will be able to more than equal the conversational feat attributed to Macklin.

* *The Encyclopædia Britannica.* Ninth Edition. Vol. XI. Edinburgh: Adam and Charles Black. 1880.

Passing from *G* to *H* we come upon an interesting and discriminating article by Mr. Garnett on "Hazlitt," and later on one with which we find much cause for disagreement on Heine, by Mr. Ferrier. At the end of his article Mr. Ferrier, speaking of the *Reisebilder*, says that, excepting the first and third books, the work has been greatly overrated, and finishes up with the statement that "the most that can be said for it is that Sterne might have written it had he been a German Jew." Most readers of Heine and of Sterne will probably agree with us that Mr. Ferrier has been led into a very grave mistake by his desire to say a telling thing. Less seriously objectionable, but equally open to question, is the observation that in the *Lieder*, "too often, no matter how sweet a chord is struck at the beginning, a dissonance creeps in, to end with a crushing discord, and the outraged reader starts like one who should suddenly see Romeo and Juliet fall to grimacing and squeaking like Punch and Judy." In the former passage Mr. Ferrier makes a sweeping statement which rests entirely on the authority of his own literary judgment; in this he states a fact and draws his own inference from it, an inference which appears to us the reverse of correct. However, much the same charge has been brought before now against Lord Byron. No doubt both Mr. Ferrier and the writers who have complained of Byron speak from their own experience; but it is a dangerous thing to lay down with such certainty a dictum which cannot pass unchallenged. There may be certain canons of literary taste so well marked as to be for practical purposes universally accepted by students; but no such canon can exist with regard to a fine point in the method of a writer of exceptional talent or genius; and we cannot think that the cause of literature is helped by the assumption of a position which may impose upon readers who trust to encyclopædic writing for a smattering of knowledge, but which is sure to be questioned in other quarters.

Of "Haroun Al Raschid, more properly Harún er Rashíd, 'Aaron the Orthodox,'" Professor Palmer writes an account which will be welcomed by all who may like to find that their early notions of the great Caliph were not so incorrect as such notions generally turn out to be. Haroun Al Raschid (whose full name was Harún 'bn Mohammed ibn Abdallah ibn Mohammed ibn Ali 'bn 'Abdallah ibn Abbás) was only twenty-two years old when he ascended the throne. His biographers all speak of him in the highest terms; but, as Professor Palmer justly observes, though his name is a household word, and his figure in history a grand one, yet very little is generally known about his life and history. Thus, though it may be disappointing to find that there is no mention in authentic histories of his incognito walks in Bagdad, and that the account of his relations with Charlemagne rests on no trustworthy basis, it is pleasant to learn that his reign was one of the most brilliant in the annals of the Caliphate. The greater part of the Eastern world submitted to him, and Egypt was a province under his dominion. No caliph ever gathered round him such a brilliant society. Haroun himself was a man of high cultivation, and an accomplished scholar and poet. "He possessed exquisite taste and unerring discernment, and his dignified demeanour made him an object of profound respect to high and low."

In the remaining part of the volume, amongst other articles, we find an interesting and valuable one headed "Heron," by Professor Newton; one on "Hieroglyphics," by Mr. R. S. Poole, which fills the lay mind with mingled bewilderment and admiration at the skill of interpreters; and a concluding article of much general and special interest on the hippopotamus by Mr. Gibson.

SUSSEX STORIES.*

THE short and simple annals of the poor are not often pleasanter reading than in these *Sussex Stories*. Real records they must be, if not always of literal fact, yet of character and action as seen by an intelligent observation, quickened by a sympathy peculiarly alive to the feelings, trials, opinions, and prejudices of the class depicted. It is this sympathy perhaps that makes the author jealously suspicious of the line of active benevolence towards the poor—so much so as sometimes to be a little hard on good people who adopt the didactic tone in their intercourse with them. She suspects a sort of selfishness in such a relation; a relation in which sympathy plays a subordinate part to the notion of fulfilling a duty, with an eye, moreover, to the ultimate satisfactions which a duty performed at some sacrifice of ease or of more congenial pursuits is apt to bring. This phase of character has long ago been stigmatized as "otherworldliness." The reproach is plausible, to say the least of it; but there is something to be said on the other side; and it certainly will not do to wait till duties become pleasures before we think ourselves fit to perform them. This, however, is not the place for the argument with all its pros and cons; and one thing at any rate is pretty certain, that no one can write about the poor with either truth or telling effect, where intercourse with them has been felt to be a condescension, or even where the notion of duty has been uppermost. Wherever there is an interchange of thought there must be a certain sense of equality. Our author's sympathy is founded on this understanding.

If, however, district visitors or other benevolent ladies receive a gentle snub on the score of this condescension, there is no slight thrown on recognized authorities. The Church, in particular, is well represented. The vicar and the curate show a keener insight than their voluntary aids; but the examples given of rustic piety are no immediate reflections of their teaching, and the actuating religion of the poor has its own distinctive tone and character. It is this rustic life in all its contrasts with modern ideas, or in contact with them, which interests the reader. There is an old-world tone in many of these stories that carries us back to another age. Thus Polly in the "Golden Wedding" answers more to the Griselda type of fidelity and endurance than anything to be seen in modern life, with its keener susceptibilities and livelier sense of rights and claims. The curmudgeon Jem Saunders must surely represent a real person. The story of which he is the hero must have at least a foundation in fact. The admirable Polly gives her hand to him, understanding him in a dim sort of way, but satisfied always that he cares for nobody but herself. She had early answered her mother's indignant notice of his treatment of her "pretty" after she had done him a good turn, "He don't want me no more just now," says Polly, brightly; "he'll be sure and come to me when he does. Jem likes me better than anybody, mother." Men are selfish still, but only in an out-of-the-way corner of the earth could selfishness nourish itself into such completeness as Jem's does, steady and far from disreputable as his life is. When children come and bore him he takes up a resolution. He will live alone and leave his wife to maintain herself and the children. To this end he takes possession of a shed a stone's throw from his house, furnishes it, and sets up a cobbler's stall:—

> It is not to be supposed that Polly submitted quietly to this new whim. At first she did; but as the days went by she sought her husband to remonstrate with him. The neighbours began to talk. Anything like prolonged quarrel between man and wife is so exceedingly rare in that class that it was no wonder people talked. Polly went to the cobbler's stall. She had the rosy laughing little Polly in her arms. Saunders was at work upon a pair of boots. When he saw his wife he swept the boots and all his paraphernalia off the board, and fastened it shutter-wise. The door was locked. Polly rattled the handle, baby beat with her tiny fists upon the door. There was no response. Presently Dell (of the next house) came out and looked at the mother and child. "What a strange whim," he said.
>
> "It be," said Polly; "he wasn't never like other folk. When he wants me he'll let me know. Good-day to you, Mr. Dell." She spoke bravely and went home bravely. Her husband was not to be blamed, not in her presence, at least.

Years pass on. The vicar and the ladies remonstrate, but Jem holds his ground. After a while public opinion ceases to notice him; he even goes to church, where from the gallery he can see wife and children if he cares to look for them. His children grow up, and grandchildren supply to Polly the infant charges of her early married life:—

> In Polly's heart is a perpetual childhood of cheerfulness and love, ready to respond to any call made upon it. It was years now since she had so much as turned her head that way when passing the cobbler's stall. If any one had thought about it, which no one ever did, for time had raised a new generation, they might not unnaturally have come to the conclusion that Polly herself had forgotten the existence of her husband as much as his children had done.

One day Polly, with a grandchild at her side, was at the village shop when some talk arose of a man taken in a fit, and the name Saunders came up. At first she observes upon the various sorts of fits there are, and suggests mustard clapped on the back, when suddenly a thought occurs to her:—

> "Saunders, did you say? Why, it be my man!" Polly caught up the babe, and went straight to the cobbler's stall.
>
> "Well, I never!" exclaimed the mistress of the shop, standing in the doorway, shielding her eyes with her hand, as she watched the old woman walk briskly away. "Wonders will never cease. I've heard tell they were husband and wife."
>
> The doctor was in the shed with Saunders when Polly entered. "It's well you came," he said; "with everybody out in the hop-garden there is nobody to attend to this man. It is fortunate I lived so near myself. Can you spare a day, Mrs. Saunders?"
>
> "I be come to fetch him home, doctor," said Polly.
>
> "Home?" the doctor stared, then remembered that he too, like the woman at the shop, had once heard that Saunders the cobbler and old Polly were man and wife. "It's the best thing you can do," said the doctor.
>
> Just then Saunders recovered consciousness. He turned his head, upon which the few scanty locks were grey, towards the door. "Polly!"
>
> "I be here, Jem." Of course she was there; he wanted her again at last, and she was ready.

The coincidence, which gives its name to the story, that this happened on the fiftieth anniversary of their wedding-day we must suppose to be an ornamental addition to a true tale.

The "Tinker's Letter," from the non-reading of which so much good accrued to the leading personages in the story, is another touch of the old ignorant times, told with great simplicity and air of likelihood. As for little Rosie, she is charming. Her innocent affability and its effect on others will come home to the reader who has ever experienced a curious satisfaction in being accosted by a little child on the highway—accosted from the mere desire of sympathy in some small joy, and reliance on finding it. It is impossible for him not to feel a moment's elation; there must be something more winning about him than the world has hitherto given him a right to suppose, to attract this artless confidence. "Our Rosie be a very harmless child," says her father; the word implying in its Sussex use that she has a certain friendly and winning way with her that goes straight to people's hearts, while her mother's one fault in Rosie is her manners:—

> "If you'll believe me she'll up and speak to the gentry themselves just as soon as you or me. I tell her she ain't no manners; for my part I've always homaged my betters, and I've brought up the lads to do the same; but Rosie, now, 'tain't that she's any ways bold, but she've no manners. She don't so much as wait for the gentry to speak first."

* *Sussex Stories.* By Mrs. Robert O'Reilly. London: Strahan & Co.

Some of these gentry meet the little maid as they are gathering blackberries. Deeply interested in their proceedings, she spoke at once:—

"Monday was a week I gave a whole pound of blackberries to our pig; they was just ripe."

"To the pig? Why, what a shame!" The girls laughed at this friendly little person who accosted them with such small ceremony.

"He liked 'em," says Rosie, smiling. "Don't pigs like things same as other people?"

She set her basket carefully in the hedge—for, to put one phase of Rosie's harmlessness negatively, as her mother was apt to, "she was no ways random"—and began as a matter of course and without invitation to help to fill the baskets of the young ladies, prattling all the time with so much artlessness and modesty, that the strangers fancied themselves in Arcadia.

This artlessness is true to child-nature, but we cannot say as much for the simplicity of Little Grig's utterances, the hero of a story inspired by a didactic purpose. Little Grig is a London child, clever enough to be an "Arab" or a "Gamin"; but a good dying mother and his own conscientiousness preserve him from the perils of surrounding circumstances. It is his way to take literally, and to act upon, all the teaching that comes in his way. His connexion with Sussex is through the hop-grounds. He is one of a band under the charge of "Granny," who goes down annually with a body of men, women, and children, keeping them in order and close to their work while under her control; receiving their pay, and not distributing it till their return to London. She is a selfish old creature, but competent to her task, "a general," and "fond of power"; and she is well drawn, as are the hop-picking scenes. It is Grig's logical application of all chance good teaching that jars against one's sense of probability. The very first knowledge that comes in a child's way includes such knowledge of human nature as would preserve it from Grig's tone of argument. He gets into a scrape, is suspected of robbing the farmer's orchard, denies the charge, gets severely thrashed, and swells with rage at the injustice. He is longing for vengeance, when the Vicar, who has taken in hand a class of boys—hop-picking foreigners—finds him, and recalls the Lord's Prayer to his mind. It is barely conceivable that the cloud of sullen anger should be dispelled, but mother wit would certainly have withheld him from the answer to the farmer who had beaten him, and who now asked him this Sunday evening:—"You looked glum enough yesterday, my lad, have you got over your punishment already? What makes you so gay to-day?" "I don't know," said Grig, smiling up at him, "leastways unless it is because I have forgiven you, sir." The farmer not unnaturally takes this for impertinence, and lifts up his stick again. Grig dodges, and finally escapes, and carries his experiences to a motherly friend. "Do you know about trespassers, Sue?" said he. "I never heard tell of 'em till to-day. It's them as does us bad turns, you know, and we've got to forgive 'em. We 'aint got no call to *tell* 'em so—its best ways *not* fur to tell 'em, I should think," he went on meditatively, and recalling his own experience. The real Grig would have known this quite well without the teaching of experience. But the author can write with truth to nature when no didactic purpose interferes. Her views on peasant life are made on observation. The canting old woman who always expects a shilling along with the good reading, and the Darby and Joan, two old folks whom a train of misfortunes bring to the workhouse, are pictures from the life; and the question of service, "Twelve months' Good Character," is treated practically whether from the mistress or the servant point of view. The railway takes girls up to London, subverting the whole system of service. "I don't hold with cheap travelling," the father may say, "there wasn't no seven-and-ninepenny returns when mother was young and went to service in her own neighbourhood, where a young fellow had a chance to see her now and again"; but, however, no one was going to interfere with Lydia, and in this non-interference the author sides with the parents. It was only just, they considered, that if she could earn her own living she should go her own way. The conditions of life were altered. The lady at the Hall scolds the mother roundly. Lydia ought to be kept at home and under her mother's eye for years to come; but everything tends nowadays, amongst others the schooling, to teach girls independence. Every girl can get a place if she goes up to London for it:—

Poor Mary sighed; she despaired of making the lady understand the different footing on which a mother and daughter stood, where the daughter earned her own living and was so far independent, and where the daughter was a young lady in the school-room still, without the power of being independent, even should she have the wish. If Lydia was coerced, a sense of injustice would rankle in her mind, she would come to no good. Therefore Lydia should not be coerced, though Mary sadly regretted this offer of Mrs. Danver's had not been heard of before Jane Lowe's letter came.

This sense of independence is one of the compensations which in youth make up so much for the differences between rich and poor. It is good to bear the yoke in youth, but it is heavy. The yoke is a light one to young girls under Lydia's circumstances. The authority of parents has no more weight with young people of the working-class than the sense of duty gives it. The new condition of things must be met, not fought against, and those whom the new conditions touch most closely are supposed to see most clearly and to realize the consequences that must follow upon them.

We have complimented the author on her accuracy of observation, but it has its limits. In the story called "Waiting" it certainly seems as if the young oak's "budding boughs" had tender green leaves to be wooed by mild February airs. We may say the same of the illustrations. Those of rustic life are superior in truth and spirit to the common run of such delineations; but here again we observe that the ladies gathering blackberries are wrapped in furs.

THE INDEX SOCIETY'S PUBLICATIONS.*

THE Index Society has begun operations in earnest. In publishing last year's Report it has taken the opportunity of including some short indexes of special importance—namely, Mr. Huth's of "Books and Papers on Marriage between Near Kin"; Mr. Birch's, of the "Styles and Titles of English Sovereigns"; some lists of the portraits in old magazines; and an index of "Obituary Notices" for 1878. Together with the volume which contains these miscellanies we have before us Mr. Solly's *Index of Hereditary English, Scotch, and Irish Titles of Honour*, a work of amazing industry and considerable value, especially to the historian. The Society sees a long career of usefulness before it. Indexes are in hand of English topography; of English Roman Catholic priests, from Elizabeth to James II.; of local engravings; of portraits of British worthies; of books on horses; and, above all, of the *Gentleman's Magazine*, from 1731 to 1867, when it lost its old value. The cost of such a work as this last would be large. "It was found that in the total 223 volumes, extending over 138 years, there could not be less than 340,000 separate entries." If these are printed in double columns, they will occupy at least eight volumes of 600 or 700 pages each, and the printing alone will cost above 2,000*l*. By judicious weeding-out of the shorter notices the work might be got into four volumes; but we confess to a feeling that, if the thing is to be done at all, it should be done completely. Often the mere name and date are of importance. Hundreds of entries which contain nothing else are of the greatest value to the men of this generation; and the Committee wisely observe that the objections to any system of selection are so great that, though they cannot agree to the larger estimate in the present state of their funds, neither do they feel justified in undertaking the smaller one only. So the matter unfortunately remains; but it is to be hoped that a guarantee fund may be formed before long which will enable the Society to commence the work. Mr. Fenton has promised to undertake its superintendence. Another useful index will be that of "Places where Roman Remains have been found in Britain," of which a very tempting specimen is given.

Of the indexes accompanying the Report the most interesting is that of Mr. Birch, which details in order the styles and titles of English sovereigns from the seventh century. At the same time we cannot say it is by any means a faultless example of what an index of the kind should be. It was originally begun in the columns of the *Athenæum* at the time of the Queen's assumption of the title of Empress of India, and gives instances in plenty of old Kings who called themselves both Emperor, "Basileus," and even Augustus. It is obvious that the notes here collected would have been both more useful and better reading if they had appeared more in the form of an article with an index than as an index annotated. Extreme brevity is a mistake in work of this kind, and in more than one case makes Mr. Birch contradict himself. Thus, at p. 65, under the list of titles of King Henry VIII. we have that of "in terra ecclesie Anglicane et Hibernice supremum caput." It has been often debated of late years whether this title belongs to our present Queen or not. To judge from p. 65 one might suppose that it does. Yet from a passage in p. 72 it is clear that it does not. The title was first assumed, as we have seen, by Henry VIII. Mr. Birch gives it also as belonging to Edward VI. Under Mary, he says, "et in terra, etc., as above," implying, of course, that this Romanist Queen continued the use of the Protestant form. One naturally looks to see in the next instance when it was disused. But here we have no information. Mr. Birch gives a long list of the titles of Philip and Mary—from which it is omitted—such as "Archiduces Austrie et duces Mediolani, Burgundie, et Brabantie"; and when we come to Elizabeth we read "Anglie, Francie, et Hibernie regina, fidei defensor, etc." In strictness this "etc." means that Queen Elizabeth was Archduchess of Austria, Duchess of Milan, and so forth. In the notes at the end, however, Mr. Birch expressly states that George III., late in his reign, added "after *defensor*, the words 'et in terra ecclesiæ Anglicanæ et Hibernicæ supremum caput,' a title first used by Henry the Eighth, and not continued beyond Mary the First."

In the portion of his work which relates to the kings before the Norman Conquest there is much curious information. Here a chronological arrangement with an index would have been better than the alphabetical form. It would take some time and search to make out from Mr. Birch's notes what is the oldest style and title of a British sovereign. We say "British," because it is abundantly evident that most of these old kings used Britain as the name of the kingdom, "Rex Anglie" not occurring before Richard I., though "Rex Anglorum" was usual at a very early period. Edgar, in 966, just a century before the Conquest, speaks of himself as "possessing the monarchy of Great Britain," and this is the whole of his title as recited in one charter (Kemble, *Codex Diplomaticus*, dxx.). Still more curious is the phrase used

* 1. *Report*, 1878; *with Four Appendixes*. 2. *Hereditary Titles of Honour*. By Edward Solly, F.R.S. London: for the Index Society, by Longmans & Co. 1880.

by Ethelbald, about 725, in signing a charter, "Aethilbaldus Brittanniae Anglorum monarchus." Sometimes, however, the use of the word Britain under the early English kings seems to have implied power beyond the limits of the English settlement and over the Welsh and Scots. Mr. Birch unfortunately concentrates his attention on the titles Monarchus, Rex, Imperator, or whatever else they may have been; and the regions ruled—England, Britain, Northumberland, "the pagans"—are not separately noticed in his index. This renders it much less useful than it might have been. The growth of the use of the word "Angle," or English, in the place of the word "Saxon," might have been illustrated without much additional trouble. There must be some reason why the West-Saxon kings came to be called only by the name of the conquered tribes of the eastern part of their realm. Perhaps the use of the name Britain was a temporary compromise. Brytenwalda occurs, says Mr. Birch, "but once in a diplomatic document, as far as my researches go (and that I find used by King Æthelstan in A.D. 934), although we recognize therein the more familiar expression 'Bretwalda,' or 'Brihtwalda,' into the consideration of which it is not my intention to digress on this occasion." Mr. Birch's language is not very clear at any time, and this passage baffles comprehension. How it could be a digression to discuss the meaning or catalogue the use of the word "Bretwalda" in a paper on the royal titles of our early kings is not easily seen. Among the more curious forms employed we may notice the "industrius rex" of Edmund, Edwy, and Edgar; "industrius Anglorum rex gubernator et rector." The office of king must indeed in those days have been one very analogous to that of the Premiership now, so justly described as "an ill-paid servitude under the name of power." Edwy is called "beatus agonista totius Brittaniæ," and Ethelred "regni gubernacula sortitus," as if reigning meant hard work and plenty of it. Offa calls himself "strenuissimus rex," a title which goes very well with the "industrius" of Edmund and the "pacificus" of Edgar. Mr. Birch has brought a great deal of interesting information together within the compass of a short paper, but we fear it must be characterized as only an essay towards the complete elucidation of the subject.

Of the other indexes in the same volume there is not much to be said. Mr. Huth's industrious compilation is a curious example of energy directed into a very out-of-the-way channel. Lord Dundreary thought so few people lived in glass-houses that it was not worth while to make proverbs for them. Something of the same kind involuntarily passes through the mind when we read this elaborate and careful list of books, and even papers and pamphlets, on "Marriage between near kin." It seems, however, to have been a subject which early engaged attention, and Mr. Huth starts his list with a book first printed about 1472-1475; that is to say, it must have been among the earliest books ever printed. This is Andreas on "Arboribus Consanguinitatis et Affinitatis," printed at Nuremburg in 1477. But the subject was a favourite one with mediæval authors, and Mr. Huth cites St. Anselm among those who treated of it.

Mr. Solly's *Index of Hereditary Titles of Honour* promises to be of great use to the student of history. It is surprising to see how much research Mr. Solly has sometimes contrived to boil down into a single line. His work is described in the preface as an index of "the peerages and baronetages of the United Kingdom," showing the date when each separate title was conferred, the changes which they underwent, and their present condition, whether existent, modified, dormant, or extinct. The use of the phrase "United Kingdom" is misleading, as there is now a separate peerage of that name; but Mr. Solly explains in the next sentence that he means a reference to the peerages and baronetages of all creations. The necessity for such a work is illustrated by an anecdote:—

Some years ago the compiler of this Index was asked by a friend, who had just taken "Amyand" House, to inform him who Sir —— Amyand, Baronet, was? Reference to the current Baronetages of England, Scotland, and Ireland, showed that no such title was in existence; and reference to the extinct Baronetages did not show that the title was extinct. The inquirer was at fault, and it was not till some weeks later, when by the aid of *Serendipity*, as Horace Walpole called it—that is, looking for one thing and finding another—that the explanation was accidentally found that the Baronetcy conferred by George III. on the son of his grandfather's skilful medical attendant, Claudius Amyand, in 1764, had, for very good family reasons, been changed into Cornwall by the second Baronet, in 1771.

Mr. Solly is much puzzled by the variations of spelling of titles as well as of family names, and in some instances he seems to depart too far from the recognized usage. Thus, under De Roos, he gives all the titles which bore at different times the forms of Ros, Rose, and Ross; but on a later page he gives "Roos (or Ros)" as an alternative. He is doubtless right in classing all the Smyths, Smijths, and Smythes together under Smith, giving the present spelling also. *A propos* of Smith, he leaves out this surname in his notice of the title of Derby. Yet the last two Earls certainly bore that surname as well as Stanley, and we have no reason for supposing it has been recently dropped, though Burke omits it. He likewise classes all the Montagus and Montagues together under the longer form, and so loses what for many years was certainly a distinction between the different branches of the family. It would be interesting to know the authority by which in certain cases he gives "of the Army," or "of the Navy," instead of a territorial title, to some four or five baronetcies. "Oakes of the Army," "Pottinger of the Army," figure in Burke without any place or service being mentioned. But Broke, which Mr. Solly gives as "Broke of the Army," is, and probably always was, "Broke of Broke Hall." For convenience, doubtless, he gives Guelph as the family name of peers of the House of Hanover, using Plantagenet in the same way as well as Tudor and Stuart. With the disputed title of Mar Mr. Solly is very cautious. He gives four earldoms—namely:—

Mar. *Martacus*. Earl. S. (Scotland.) circa 1060. s.p. 1419. Presumed (?) to be dormant.
Mar. *Stewart*. Earl. S. 1426. s.p. 1435. Ext.
Mar. *Stewart*. Earl. S. 1457. s.p. 1479. Ext.
Mar. *Erskine*. Earl. S. 1565, to date from 1547. Attainted 1715. Restored 1824. (United with Kellie, 1829.)

It is impossible, when we see these handsome volumes as the equivalent or reward of a single guinea subscription on the part of 152 members of the Society, to avoid an unpleasant thought. The printing is clear, the paper good, the binding showy and solid, if not beautiful; the correction of the press almost perfect, and that too in books dealing almost exclusively with proper names and numbers. The conviction is forced upon an impartial mind that, in the case of ordinary books, when the author receives nothing for his share of profit, and probably, as in most cases, incurs a debt, the publishers' gains must be enormous. Yet co-operative publishing Companies, except those which are learned Societies, do not seem to succeed.

DRAWINGS BY JAPANESE ARTISTS.*

THE modern taste for the products of Japanese art has its serious as well as its humorous side. In the crazy mania for blue and white china, and in the excessive affectations which so often accompany its indulgence, the satirist finds fit material for the exercise of his calling. Many persons fill their rooms with plates and beakers who have no sort of appreciation of the real merit of these interesting objects. There are modern drawing-rooms so crowded with cups and saucers that even the most cautious and decorous intruder is apt to feel in the awkward position of a bull in a china shop, and his discomfort is the more inexcusable seeing that the unhappy possessor of these treasures is often as much embarrassed as his guest. But here, as in most matters of human interest, the blind following of fashion implies the existence of a serious sentiment of taste within a narrower circle. There can be no doubt that the more familiar knowledge and closer study of Oriental art which characterize our time are likely to exercise a genuine influence upon all forms of artistic effort, and it is therefore of real importance that the peculiar excellence of Oriental design should be rightly understood. The praise which is justly due to the Japanese artist is often bestowed in such a manner as to obscure his real claims to consideration. He is compared with the artist of Western Europe without sufficient regard to the inherent limitations of his style; and the assured dexterity of his method is held up as a model for imitation to painters who are dealing with problems which the Japanese artist has never attempted to solve. We do not intend by any means to imply that the perfection of Japanese design may not be made to serve as an example to the artists of our own school or of the schools of the Continent. There is, on the contrary, very much to learn which cannot be so successfully acquired from any other source; but the teaching will surely prove of better effect when it is clearly understood that the practice of one school is not to be appropriated by the professors of another without the necessary modification required by difference of aim and of tradition.

These elements of distinction are very admirably expressed in an essay by Mr. Frank Dillon, written to accompany a series of reproductions from Japanese drawings. Mr. Dillon is himself a painter, and he is therefore in a position to appreciate the special tendencies of modern art. Nor is he by any means disposed to underrate their value. On the other hand, he has visited Japan, and has seen the Japanese artist at his work. He enjoys to the fullest extent the qualities of taste in arrangement and accomplished technical skill which are to be found in Japanese design, and he is able to distinguish accurately between the traces of a prevailing tradition and the exercise of an individual talent. He has, besides, collected for himself a series of remarkable specimens which illustrate very clearly the actual processes of the Japanese artist. The drawings here reproduced were for a time exhibited at the Burlington Fine Arts Club, and it will be in the memory of those who inspected the collection that they are, for the most part, direct studies from nature, or schemes of composition made in preparation for more finished designs. This in itself renders them specially instructive, as showing the precise relation which Japanese art in its highest forms bears to the facts upon which it relies. An unfinished study is often more eloquent than the most accomplished performance. It permits us to note exactly the amount of liberty which the artist concedes to himself, and to observe the process by which he translates the results of his observation into the settled scheme of his picture. In regard to the reproductions themselves, it may be said that the chosen method is peculiarly adapted to the purpose. The originals have been photographed and printed in autotype, and then each print has been coloured by hand, so as to produce a faithful copy of the artist's work. Those who are familiar with the laboured attempts that have been made

* *Drawings by Japanese Artists, Reproduced and Coloured in Facsimile by the Autotype Process.* With Letterpress Descriptions, by Frank Dillon. London: Hogarth & Sons.

to translate Japanese paintings by means of chromo-lithography will not be slow to recognize the superiority of Mr. Dillon's plan. The essential beauty of Japanese colour depends upon the transparency and purity of each separate tint, and these are just the qualities which chromo-lithography is powerless to render. On the other hand, the power of these drawings consists even more in skilful and refined draughtmanship than in fulness of colour; and it is therefore of the highest importance that every subtlety of line should be reproduced by the faultless mechanism of photography. As bearing out what has been said, we may particularly refer to the wonderful study of a pheasant (Plate 4), where the intricate marking of the bird's plumage is faithfully recorded even to the most minute detail, and to the spirited sketch of a bantam cock (Plate 11), in which the colourist has most successfully followed the sweeping strokes of the painter's brush.

But our chief interest here is with Mr. Dillon's introductory essay, in which he has given what seems to us a singularly just estimate of the limits and resources of Japanese art. In his enthusiastic sympathy with his subject he never loses sight of the fact that the faculties of the Japanese artist are definitely restricted in respect of the material upon which they are employed. And this restriction, it must be confessed, carries with it certain advantages inevitably denied to artists of higher aim or wider range. The art of Western Europe has always been closely allied to the movement of moral and intellectual ideas, and it has therefore suffered all the vicissitudes of national vitality and decay. It can only rise to greatness under conditions that are partly independent of purely artistic influences, and inasmuch as it assumes to reflect the spiritual problems of our race, it must of necessity follow to a certain extent the fortunes of humanity itself. And as the technical part of every craft is inextricably bound up with the intellectual ideal, the European artist has never been able to preserve that certainty of practice and assured perfection of method which belong to his Eastern brother. For, in abandoning the higher victories of design, the Japanese artist also escapes to a large extent the dangers of decadence in style. Mr. Dillon refers to this limitation, and, while he admits its consequences, he seeks to offer some explanation of the facts themselves. "Among the many anomalies of Japanese art," he writes, "nothing is more noticeable than the conventional treatment of the human figure, contrasted with the realism which especially marks their rendering of smaller animals and inanimate objects. The vexed question as to how far this avoidance of actual types is intentional cannot be fully discussed here, although it would be an interesting subject for investigation. It will be sufficient to point out that certain qualities regarded by us as the highest aim of art are conspicuously absent from their works. Instances of accurate drawing and varied expression may indeed be found in the figure-subjects which adorn some of the older temples, and notably in the famous Hong-gan-ji Temple at Kioto; but these must be taken as exceptions to a rule prevailing generally throughout the whole range of Japanese art. In the great majority of instances the stage has given the keynote for the rendering of the heroic incidents which the artist loves to depict, and the unreality of the prevailing types is a natural result of the exaggerated sentiment which pervades the drama of Japan—a mixture of the horrible and the grotesque, which meets the wants of a people in whom warlike instincts and a sense of humour are seldom absent. The faculty of appreciating the loveliness of natural scenery, the tender grace of flowers, or the subtle gradation of colour in the plumage of birds, is strangely blended in the character of men in whom such tendencies prevail; and this naturally suggests a comparison with nations in which qualities the very opposite to these are manifest." Mr. Dillon thereupon proceeds to comment upon the inferior importance assigned to the facts of natural scenery in the productions of classic art and the earlier painting of the Renaissance; but it is worthy of remark that a similar problem presents itself within the limits of the antique, for the contrast between the realization of birds and flowers and the conventional rendering of human form to be found in Japanese design is scarcely more significant than is afforded by the expressive vitality granted to the lions on an Assyrian bas-relief, as compared with the rigid forms and indifferent faces of the human actors in the scene. Passing to another aspect of his subject, Mr. Dillon makes some instructive remarks upon the relation between Chinese and Japanese art, in which he assigns to the former an influence analogous to that exercised upon the schools of Europe by the example of classic style. The conservatism of the Japanese people he attributes rather to their isolation than to any innate dislike of change, and this view of the matter is certainly borne out by the eagerness with which they are now accepting the teachings of Western Europe. In common with all who have witnessed the results of this teaching Mr. Dillon deeply deplores its effect upon Japanese art. For the moment, no doubt, the loss is undeniable; but it will be interesting to discover how far a people so powerfully endowed with artistic instinct will be able to appropriate the ideas which for the present only serve to overthrow their former supremacy. It may be that in future Japanese design is destined to take a wider range, and to include certain aspects of human beauty which in the past have been rigidly excluded.

JEBB'S SELECTIONS FROM THE ATTIC ORATORS.*

EVERY scholar and student will welcome the complement fitly added to Professor Jebb's History of the earlier Attic orators by his companion volume of specimens from their speeches. We have here a series of their most characteristic passages, with notes and comments—a mirror wherein "to see the old Greeks as they lived and moved," and to study Greek society in its larger political aspects. Mr. Jebb's object has been in the choice of such selections to interpret each author's part in the evolution of Attic prose style, and the bearing of each passage on the representation of Greek thoughts, politics, and manners. To this end he has judged extracts more conducive than whole orations, although he occasionally gives entire pieces, *e.g.* Lysias for Mantitheon and against Pancleon, Isocrates against the Sophists, and the eighth and best oration of Isæus. Those who possess the comprehensive History on which this volume is the best of illustrative commentaries can turn to it at need for a clear and full analysis of each speech or extract of the thirty-seven of which it is made up, and they will find the task all the lighter and pleasanter for the sound judgment with which Professor Jebb has selected his extracts. He also sets vividly before his readers the subject-matter of Greek politics, as studied in the living pages of the orators; and we defy any one to follow the extracts given in this volume from the famous speech of Andocides "De mysteriis" without feeling as if he were an eyewitness of the events.

As Mr. Jebb points out, the history illustrated by Antiphon and Isæus is social rather than political. The former was chiefly concerned with the court of Areopagus, where irrelevancies were forbidden. Isæus was chiefly versed in private affairs. On the other hand, Andocides, the brilliant amateur; Lysias, the model of Attic grace; Isocrates, "the founder of the style which, through the prose of Cicero especially, has exercised such influence on Europe"—these three are directly or indirectly political historians, and serve, like Andocides, as valuable lights on the panic of 415 and the revolution of 411 B.C., or the crisis of the Corinthian war, 390 B.C.; or, like Lysias, for the sequel to the Peloponnesian war, the reign of the Thirty Tyrants, and restoration of Athenian democracy; while Isocrates illustrates the climax of Spartan supremacy in 380 B.C., the paralysis of Athenian hopes for the second time in 355 B.C., and Philip's successful winning his way within the circle of Greek independence in 346 B.C. Through these orators we can best study the progress and development of Attic prose. The works of the orators from Antiphon to Isæus—represented first by the tendency to the "austere style," then by the Gorgian, then by the compromise between this and the idiom of daily life in the plain style of Lysias, next by the transition in Isæus to strenuous political oratory, and lastly by this in its fullest development and greatest representative—may be said to form the bridge by which the gulf between earliest and latest is spanned. Antiphon's intrinsic interest is as the monument of an early and singular stage in prose literature, a well-marked phase of language and style. It stands distinct from the smooth style of Isocrates, or the middle style of Demosthenes, as the dignified or austere; and the samples of it given by Professor Jebb consist of two extracts from tetralogies—*i.e.* exercises in four parts or set speeches, holding a mid place between ornamental displays and *bonâ fide* orations supposed to be spoken in a trial for homicide, in this order—namely, accuser's statement, defendant's reply, accuser's retort, and defendant's rejoinder. As Mr. Jebb notes, the tetralogies are to be regarded as repertories of points and topics, not examples of finished form. Of one of these we have the second speech—namely, the accused's refutation of the charge of homicide and his answer to the appeal of the accuser for his banishment to free Athens from pollution. It is spoken by the father of the youth whose javelin has accidentally hit and killed a boy looking on. It is a good specimen of a tetralogy, and presents few critical difficulties. Of another tetralogy we have the accuser's first address, which accuses a youth who had dealt to an elder in a quarrel the blows of which he died. Its speciality is the striking light in which it presents the religious view of homicide as a defilement. The third extract from Antiphon consists of two passages from the trial concerning the slaughter of Herodes, a real case of alleged murder, and of Antiphon's later and freer style an example is given in the extract from the speech on the Choreutes relating to the poisoning of a choir boy by the Choregus with a draught to improve his voice. The date would be circ. 412 B.C.

The interest of Andocides consists in his brilliancy as an amateur. That which strikes us most in him is his narrative skill, his anecdote, his graphic force, his frequent touches of dramatic power. He is, above all, an historical authority of great weight for the period between 415 and 390 B.C. At the very outset of our first sample of his oratory, the speech about his amnesty, spoken not later than 410 B.C., an instance of the Andocidean vividness is noted by Professor Jebb. In Section 16 the orator refers rhetorically to the quickness with which his acquiescence in a life of exile gave place to a natural longing for "the social life of Athens (ἐκείνης) from which I passed into this exile," where ἐξ ἧς δευρὶ μετέστην vividly describes his feelings in banishment, although he is speaking at Athens before the Ecclesia. In like manner in his speech on the charge of impiety

* *Selections from the Attic Orators—Antiphon, Andocides, Lysias, Isocrates, Isæus; being a Companion Volume to the Attic Orators from Antiphon to Isæus.* Edited, with Notes, by R. C. Jebb, M.A., LL.D., Edin., Professor of Greek, Glasgow. London: Macmillan & Co. 1880.

connected with the mutilation of the Hermæ, which is of stirring interest throughout, the same vividness appears in the graphic account of the prison scene, and in the passage as to the disclosures of Andocides concerning those informed against by Dioclides, which he justifies by the necessity that some one should speak out to clear those implicated by Dioclides, and relieve from peril of death the orator's own friends.

Mr. Jebb describes the third of his orators, Lysias, as the first to reconcile literary finish with the Attic idiom of ordinary life, and credits him with the art, unlike Antiphon or Isocrates, of concealing his art. His distinctive gifts are a delicate mastery of the purest Attic, subtle expression of character, subdued humour, a flexibility of mind ensuring unfailing grace and charm, and a manner varied with subject and occasion. In the extracts here given from this orator, the first, the Olympiacos, is a quasi-Panhellenic speech at Olympia in B.C. 388, the year before the Peace of Antalcidas, in which we are struck by his elaborate and artistic periods. In the fifth extract, from the oration against Eratosthenes, where public and private characters are combined, the periodic structure is blended with a style of greater ease and simplicity; whilst in the last oration against Pancleon, a fuller and runaway slave, the manner of composition is simpler. The speech against Mantitheos illustrates his delineation of character, whilst his power of vivid description is seen in those against Eratosthenes and Agoratus. Lysias's arrangement is generally simple—*i.e.* proem, narrative, proof, epilogue. One or two references may be made to his oration at Olympia, as well as to that against Pancleon; while for the speech against Eratosthenes, that one of the thirty tyrants who had arrested and thrown into prison Polemarchus, the brother of Lysias, which is interesting for the light it throws on the whole history of the Anarchy, we must refer the reader to *Attic Orators*, v. 1. 189-92, which gives a translation of the peroration. In the Olympiacos, § 3, Lysias refers to the legend of Hercules having founded the prizes at Olympia, and brought trees, as Pindar tells, to embellish that garden of the gods, and our editor defines the meaning attached to γνώμης ἐπίδειξιν as, not properly a contest or anything like a μουσικὸς ἀγών, as at Delphi, but a "display of intellect," which, however, thinks the orator, he did not mean to be frivolous. Accordingly the speaker is not going to descend to what he deems the task of worthless and needy declaimers; he is not going to wrangle or quibble about words, but to stir up helpful counsel as to deeds; and he goes on to plead that, if the misfortunes of Hellas arose from weakness, reason would they should bear with them; but, if from dissensions and rivalry, they should cease from feuds and arrest their consequences; and this he adds, εἰδότας ὅτι φιλνεικεῖν μέν ἐστιν εὖ πραττόντων, γνῶναι δὲ τὰ βέλτιστα τῶν αὐτῶν, "Knowing that as such rivalry implies prosperity, so prosperity imposes the duty of forethought." But, as Professor Jebb shows, he has just said that they are *not* prosperous; and Sauppe, seeing this, had proposed for τῶν αὐτῶν, εὖ νοούντων. Better, however, and more acceptable is Mr. Jebb's reading, τῶν ἀτυχῶν, the natural and plausible antithesis. The translation would then be, "Knowing that rivalry is for the prosperous, but that the part of the unfortunate is to devise remedies." The gist of the oration against Pancleon is to shew that Pancleon, a fuller living at Athens, is not an Athenian citizen, but a foreigner, and therefore rightly in the jurisdiction of the Polemarch. Pancleon's issue was a special plea consisting of an objection to the form of procedure, and Lysias pleads, with abundant evidence to back him, that he has brought the action in the proper form and court. For so short an oration, it would be hard to quote one so full of interesting customs of the Greek law courts—*e.g.* the reminder of the orator, § 4 and elsewhere, ἐπίλαβε, stop "the water-clock," an expedient for deducting the time occupied by the witnesses from that allowed to the speech; and the reference to the various jurisdiction of courts of law according as a man was a citizen, a resident alien, or a slave, and to the way in which Lysias acquired the evidence he desired in Platæa, which enabled him to prove that Pancleon was the last of the three—not a Platæan, which would entitle him to the rights of an Athenian citizen, nor even a freeman.

We have left ourselves no space to speak of the remaining orators, Isocrates and Isæus. We must be content to direct our readers to the former, especially in his essential difference from his fellow-orators—namely, that his discourses were meant to be read rather than spoken. Of his grave oratory, Professor Jebb notes that it is best suited to the preacher; and Bossuet speaks of Isocrates, Plato, and Demosthenes, as the Greek writers to whom he owed most. Isæus represents a different phase of Attic oratory—its development in the transition from Lysias to Demosthenes. In diction he resembles the former, though he is free from Lysias's love of antithesis, and is also distinguished from him by a stronger and more elaborate handling of his subject-matter. Of his twelve extant speeches the speciality, says Mr. Jebb, is the contrast between monotony of subject and versatility of tone. The extracts given in this volume are from Or. V. On the Estate of Dikæogenes, which recalls Lysias; Or. XI. On the Estate of Hagnias, which is more Demosthenic; and Or. VIII. On the Estate of Kiron, "distinctively Isæan in its mediation between these types." We recommend the volume as a Long Vacation study to the competitor for classical honours who desires to acquire a tolerably exhaustive insight into Attic orators and oratory, and who will find himself fully equipped if, with his Liddell and Scott, he has Professor Jebb's *History of Attic Orators* and the present volume of Selections.

A MODERN GREEK HEROINE.*

WE think we may assume, on internal evidence, that the author of *A Modern Greek Heroine* is a lady. Professional reviewers have, indeed, too good reason to know that male novelists may be intolerably diffuse and inconsequent; and how indeed should it be otherwise? Three-volume novels must be ground out somehow, and it is hard to find solid grist for the mill when the machinery is to be kept perpetually in motion. But, though men may run riot over the maudlin sentiment which they misinterpret, and may ride hobbies of their own to the last stages of feebleness, with shaky seat and hesitating hand, you do not find them expatiating on a thousand feminine nothings which would never suggest themselves to the masculine mind, or going with admirable realism into the most trivial details of housekeeping, cooking, and domestic economy, or enlivening these with humorous but long-winded stories as to the making of rice-puddings under difficulties. Having settled the sex of the author to begin with, we are next invited by the title to speculate as to her nation. That she is a Greek would of course be the natural assumption, or why should she go so wide of the beaten track as to select a "modern Greek" for her heroine. But here again we have it unmistakably borne in upon us that the author is as English as we are ourselves. It is quite true that her English writing is by no means altogether so pure as might be desired; but the mistakes are not the mistakes of a foreigner. We merely recognize the everyday faults of misplaced epithets and slipshod grammar, with certain subtle vulgarities of expression which are undoubtedly of British growth. Even the heroine herself, with her fantastic and most unpronounceable name, speaks the identical language that the author writes; though since she was cast on the world an unprotected orphan, up to her early marriage, she had been educated in France. The slight links that connect her and the story with the "Clime of the Unforgotten Brave" may be very briefly summarized. *Imprimis*, there is that long-resounding Christian name—Bourbachokatzouli—so exceedingly wearisome to repeat even in the writing, that we presume it explains the fact of the author's habitually referring to her heroine by the formal but unusual style of Miss Valettas. Next we have an occasional god, goddess, or hero, lugged in somehow by the head and shoulders, to be disguised in what we assume to be the orthodox orthography, and which is certainly quaint if it is not original. Finally, every now and then the author seems to be reminded of what she is much inclined to forget—that her interesting young *protégée* is a daughter of Crete, having borrowed her name from some national heroine. Miss Bour—&c. remembers suddenly, for example, that in her innocent girlhood, she has seen Arcturus glittering in the starry skies that smiled on the island of her childish associations. But then the same poetical reminiscence might equally apply to Sicily or Cyprus, or, for the matter of that, to the Shetlands or the Faroe Isles.

That Miss Valettas is most originally conceived, we are very willing to admit; and as arbitrary caprice is the prerogative of beauty, we may grant that her conduct and vagaries are not altogether unnatural. What seems far less probable is the strange series of coincidences by which, with her wayward conduct and winning eccentricities, she subjugates men of the most opposite characters, persuading them to compromise themselves by flagrant imprudences. And, for a girl who has been buffetted about in the world, and who has learned the value of money by varied and painful experiences, she shows herself strangely innocent of the transparent arts by which her devoted admirers help her pecuniarily. When she has been thankful to find a governess's place with a modest salary of 30*l.*, it never strikes her as at all unnatural that a business firm should pay her 100*l.* a year for such humble literary services as she can render them in her leisure hours. But Miss Valettas is a mystery from the very first; and that, indeed, is the gist of the story. We have her introduced dramatically enough to a worthy young clergyman, who has good cause to rue his acquaintance with the siren. The Rev. Mr. Sarleigh, the very respectable curate of the East End parish of St. Adhelm, is sitting solitary in his bachelor rooms, when the call of a young person is announced. Mr. Sarleigh, who is proper and modest to a fault—the sort of unimpeachable young clergyman, as we should suppose, who shines at tea-parties of elderly spinsters, and puts on goloshes when he walks abroad—is naturally scandalized, embarrassed, and taken aback. For the young woman, though draggled and wasted with hunger and trouble, is beautiful, and what may be best characterized as "bumptious." She comes exceedingly straight to the point, with the decision which is a marked feature in her nature. She wants help and she will have it; not temporary assistance, but the assurance of a decent maintenance. The curate's proposal to give her an instalment of what she asks, in the shape of a "square meal" and half-a-crown, is rejected with a disdainful despair that is very finished acting. She does not exactly say to him, "Your money or your life," but the way she puts it is, "Your money or my life." If he will not take her case in hand at once, and give her an assurance of permanent relief, she will go straight away and drown herself in the river; and she rehearses the prologue of the drowning scene with very impressive spirit. Carried away by the contagion of her excitement, and intoxicated by her beauty, we can quite understand Mr. Sarleigh making a fool of himself on the spur of the moment; but we are hardly prepared for a City clergyman, who must have had a cer-

* *A Modern Greek Heroine.* London: Hurst & Blackett. 1880.

tain experience, behaving on second thoughts like an absolute idiot. After having expressed his suspicions with somewhat offensive candour, he passes at once to the opposite extreme, with a facility which reminds us of the mediæval witch stories in which mortals succumb to the influences of enchantment. He takes this most suspicious young female metaphorically and literally by the hand, and to his hearth, while all the time in his heart he sorely misdoubts her. He hires for her rooms close to his own, which were lately occupied by his favourite sister. He tells lies generously on her behalf, and then writes to that sister begging and praying that she will back him up in them. He lends Miss Valettas money freely, and finally he lets her have the run of his own apartments, and with a strange mixture of pleasure and shame tolerates her imposing herself upon him at *tête-à-tête* dinners and breakfasts. We can only wonder that he emerged with any shred of reputation from an ordeal which laid him so terribly open to scandal; nor can we be at all surprised that his vulgar landlady should have given deliverance to her coarse mind in the coarsely abusive language which the author of this remarkable novel has at command when occasion requires.

Necessarily the reverend gentleman has his reward, as might be expected. Miss Valettas's ingratitude is fully equal to her assurance, and, having made use of the clergyman and borrowed his money, she wins his love and scornfully rejects it. But being a prudent, though impulsive, young woman, she does not absolutely break with him; and before showing the contempt she cannot help feeling, she has made sure of a second string to her bow. She has made the acquaintance of one of the curate's friends, who, before he is well conscious of making the *glissade*, has fallen over head and ears in love with the adventuress. This is conceivable, for Jack Montenotte is an artist and a Bohemian to boot, and like draws to like. He has an eye, moreover, for the picturesque and the beautiful, and may be presumed to have recognized the perfect Greek type in the piquant charms of the pert Miss Valettas. But Montenotte's father is equally captivated—platonically and vicariously be it understood—and strongly urges his son to marry her. The passion which Montenotte cherishes is returned; but the course of true love never runs smooth, as we know, and this is no exception to the rule. Before the struggling heroine is to set foot upon solid land, she has to go through sundry vicissitudes and make many an awkward stumble; and besides there are secret ties to be sundered. She is admitted as an inmate in a strict Sisterhood where she gaily outrages all the proprieties—smoking cigarettes in the cloisters and offering her cigarette case to the Lady Superior. This habit of cigarette smoking, by the way, was an additional attraction to Mr. Montenotte and his father. Next she goes out as a governess in the family of a Mr. and Mrs. Rowlands: and, to do her justice, the author has depicted the vulgarity of that couple with a force which leaves little to desire. Both the lady and gentleman are in the habit of getting drunk, or, at all events, are frequently "disguised in liquor"; and Mr. Rowlands precipitates the inevitable rupture by insulting the governess with his impassioned advances after over-indulgence in his favourite beverage of "B. and S." It may be urged, however, in favour of the author, that these Rowlands are intended to be outrageously vulgar. But really, upon the whole they have rather the advantage of the lady sisters of the Rev. Mr. Sarleigh, into whose family Miss Valettas has been welcomed as a guest on their brother's warm introduction. Lilian, the youngest of the three, is made to plead deformity of person and habitual ill-health by way of extenuation for her sins against the law of the land and the proprieties. Still it seems somewhat strong to represent her as stealing money in petty sums from her mother and sisters, leaving suspicion to fall upon the servants, and afterwards robbing Miss Valettas of a couple of sovereigns when that young lady has placed her purse in Lilian's hands. Nor is it even set down, so far as we remember, to the fashionable disease of kleptomania; and we confess to being somewhat astonished that the author should have neglected the opportunity of bringing in a Greek word. And Miss Lilian Sarleigh had a command of "Billingsgate" which even her brother's landlady in the parish of St. Adhelm might have envied her. Here is one of the pleasing flowers of speech, culled at random from the vocabulary which she drew upon with a volubility all her own:—"Because I like it. I'm not going to be jawed, and that is the end of it. If you like to sit here and sermonize to the deuce, you may. I'm going." One may gauge the refinement of the social atmosphere in which Miss Lilian must have been brought up, when she was suffered to break out in eloquence of this fashion; and where her shabby thefts scarcely provoked more sensation or reproof than the fits of temper which were of hourly occurrence. To do Lilian bare justice, however, she is decidedly one of the best of the characters. Essentially unprincipled, vulgar-minded, and shrewish, she is invariably consistent and true to herself, though Miss Valettas, with something of a sisterly feeling, perhaps, charitably professes to find redeeming qualities in her. By the way, she takes after her mother, who can speak almost as forcibly as her youngest daughter when moved out of her habitual selfish apathy. As for the rest of the ladies and gentlemen, their natures keep shifting in a wild phantasmagoria. Even the muddy shallows in the character of the "Greek heroine" are left to the last inscrutable problems. We shall not betray her grand secret, nor dwell on the odd *dénouement* of her story. All we shall say is, that while she impresses us as being radically false and vicious, as she is unquestionably good-looking, impulsive, and wrong-headed, she reaps in the end the rich reward of a husband who adores her, and devotes himself to make her happy. And we may grant that, though her "style" is the very worst, that need not make her union with Mr. Montenotte an unsuitable one, since he is almost worthy of the reclaimed castaway he has wedded.

FRENCH LITERATURE.

THE interest which was excited by the letters of Doudan fully justifies M. d'Haussonville in bringing out a handsome edition (1), printed with great luxury of margin, of some scattered thoughts which have been found among the papers of that acute and deliberate observer. Doudan was an old enough man to be contemporary with the last—in more senses than one—of the great *pensée* writers of France; and though his maxims, as here reproduced, do not come within a hundred miles of those of Joubert, they show something of the same general aim and tendency. Doudan does not seem to have been severely tormented by the famous desire to get "a page into a sentence, and a sentence into a word," nor are his shortest aphorisms by any means his best. He succeeds most in sketches of a page or two in length, describing generally some man or author; and his descriptions of the author are not generally as good as his descriptions of the man. Some admirable criticisms on Chateaubriand will, however, be found here, and a still more excellent one on Thiers. A living French statesman is said to have defined the political capacity of the first President of the Third Republic by saying, "Il a toujours eu le flair des situations, mais jamais le flair des hommes." So in his History, says Doudan, "Il y a des événements, il n'y a pas d'hommes"; and elsewhere "l'intelligence des événements" is assigned as the main characteristic of the historian. There is much of this acuteness about the book, and it is well worth reading. But the *Pensées* are not of the first order as literature, and when they come to deal with vague subjects, they sometimes degenerate into platitude. A certain element of personality seems to have been a necessity to Doudan if he was to exhibit his powers of observation at their fullest. In things abstract he gropes and is not at home.

Countess Mechtild of Waldeck-Pyrmont has extracted from the archives of the Bentinck and Wassenaer families a considerable number of letters (2) written by Anne and Mary, the daughters of James II. of England. Those of Anne were previously known through Dalrymple; the others appears to be wholly unpublished. Both are of considerable interest, not merely for the history of the Revolution, but as exhibiting the characters of the two sisters. Mary's affectionate piety in particular is displayed in them in a manner which must rejoice the shade of Macaulay.

The work of publishing the long buried MSS.—other than those of the Memoirs—of Saint-Simon the indefatigable seems to have been grappled with in good earnest at last. M. Faugère has undertaken the "parallel" (3) of the first three Bourbon kings, which has for some considerable time been known to exist. The chief object of this is to rehabilitate the memory of Louis XIII., for whom Saint-Simon had a kind of inherited veneration. But the purpose does not prevent the good qualities of the Memoirs from making themselves evident, along, it is true, with a considerable portion of their bad qualities.

M. Edmond-Blanc (4) is a fervent Bonapartist, and he thinks that the anti-Napoleonic movement of which Lanfrey was the great director is altogether unjust. The purpose of his book is to vindicate the First Consul's claim to the merit of having organized the administrative institutions of France. His volume contains a good deal of careful and interesting research, and deserves the attention of the student of this portion of French history. As for the author's object, it is attained as far as such objects are generally attained. Between Lanfrey and M. Edmond-Blanc the verdict is likely to be the old one—"ni cet excès d'honneur ni cette indignité." But M. Edmond-Blanc has undoubtedly carried too far the principle of attributing to Napoleon himself the credit due to his predecessors, associates, and Ministers.

By the side of the gigantic work which assures M. Littré's reputation as long as French is a language, a mere volume of literary essays (5) may seem nothing but a *parergon*. These *Études et glanures* however were well worth rescuing from the condition of MS. or the retirement of periodicals. Except an interesting *causerie*, "Comment j'ai fait mon dictionnaire," they consist chiefly of reviews on a tolerably large scale of works connected with Old French. The most important of these are occupied with M. Scheler's excellent edition of the poems of the Belgian *trouvères*, Baudouin and Jean de Condé, with M. Michelant's charming volume published some ten years ago, and containing the remarkable romance of *Méraugis de Portlesguez*, with the curious *chanson de geste* of *Hugues Capet*, and with Mr. Luard's Lives of Edward the Confessor. In all these M. Littré's erudition, his judgment, and his faculty of writing are alike conspicuous.

In the many volumes of waifs and strays which have been

(1) *Pensées, essais et maximes.* Par X. Doudan. Paris: Calmann Lévy.

(2) *Lettres de Marie, reine d'Angleterre.* La Haye: Nijhoff. London: Nutt.

(3) *Écrits inédits de Saint-Simon.* Par P. Faugère. Tome 1. Paris: Hachette.

(4) *Napoléon premier; ses institutions civiles et administratives.* Par Amedée Edmond-Blanc. Paris: Plon.

(5) *Études et glanures.* Par E. Littré. Paris: Didier.

collected since Gautier's death, not many better things have been recovered than the *Études sur les musées*, which fill great part of the now republished *Tableaux à la plume* (6). They were written in the years 1849 and 1850, after the Louvre and the Luxembourg had been rearranged, and they form a complete handbook to those famous galleries, written in the golden language of which Gautier had, almost alone, the secret. Had they been extended to the provincial galleries (as from a paper on the Tours Musée there seems to have been some intention of extending them), the extraordinary riches of France in this respect would have been enshrined in a volume which might have challenged comparison with almost anything of the kind; but at present the series remains a torso. The volume is completed by an *omnium gatherum* of art criticisms (including one on the Salon of 1869), necessarily varying in value as far as their subject-matter is concerned, but always perfect in form.

There are unfortunately but few living French writers in reading whom the change from the author of *La morte amoureuse* does not strike one painfully. Among those few, however, M. Paul de Saint-Victor holds a place second to none. He has been a sparing writer, and especially of late has given the public but little of the prose in which, more than any one else, he is Gautier's pupil. This comparative retirement is justified by the immense scale of the work (7), of which the first part is now issued. Should *Les deux masques* be carried out on its present plan, it will in point of bulk be one of the most remarkable critical studies ever printed. The author promises three series; the first dealing with the great Greek dramatists and with the Indian Calidasa, the second with Shakspeare, and the third with the entire range of French drama. Now as the present volume, containing more than five hundred octavo pages, only introduces the subject and deals with Æschylus, the whole work must be expected to fill at least six or seven volumes, if not more. We confess to a certain doubt as to the wisdom of attempting to fill so large a canvas, especially when we consider the plan on which the author has composed the present corner of it. A history of the Persian wars, even in M. de Saint-Victor's language, seems a tremendous introduction to a criticism of Æschylus. However, the work is so admirable in itself that it is hard to quarrel with the design which has occasioned it. The early chapters on the Bacchic orgies and festivals, and the running criticism of the father of tragedy himself, especially of the *Prometheus* and the *Oresteia*, are wholly admirable. M. de Saint-Victor pleases us much better in his classical studies than in some of his earlier criticisms of modern literature, where he sometimes seemed to lack the catholicity of appreciation which is demanded from critics of his rank. With classical literature he seems to be entirely in sympathy, and the result is extremely happy. In a very few instances his rich and flexible prose becomes a little too prodigal in its wealth, and seems to lack firmness in its flexibility; but this is a danger of the style which no one but Gautier himself has uniformly succeeded in avoiding. We can only add that, if M. de Saint-Victor has taken the same trouble to inform himself of the early history of French drama that he has to master the more beaten field of classical origins, his Third Part ought to give us an admirable and almost entirely novel study.

M. Renan's Hibbert Lectures have just appeared (8) in a convenient form, with the Royal Institution discourse on "Marcus Aurelius" appended. These lectures do not contain much that is new to those who are acquainted with M. Renan's great work, but they might serve very fairly as an introduction to that work, while the "Marcus Aurelius" article anticipates the volume which has yet to appear. It is needless to say that M. Renan, no less than M. de Saint-Victor, is exempted from the complaint as to degeneration of prose style which has just been made, though here, too, there are perhaps some symptoms of a certain want of severity.

Among geographical books and records of travel the place of honour must be given to the two handsome volumes (9) which M. Rocher has devoted to the province of Yunnan, one of the most interesting parts, historically and commercially, of the Chinese Empire. M. Rocher's acquaintance with the country was made seven or eight years ago, just as the Panthay rebellion was succumbing to the sheer weight and dogged pressure of Chinese power. His book contains not merely an account of his own travels, but a history of the province, a sketch of the singular episode in which for nearly twenty years the Mussulman inhabitants maintained their independence, and an elaborate account of the metallurgical industries which make the district of such great importance, and which, were it more accessible, would make it still more important. The French, as is well known to students of things Asiatic, have been encouraged by the practical failure of our efforts at opening trade between Yunnan and British Burmah to try their own luck from Cochin China and its "protected" dependencies. But M. Rocher writes in no spirit of narrow nationality; and indeed he seems to have been assisted by Englishmen in bringing out his book, which, it should be noted, has an excellent map and many diagrams. M. Rivière's *Souvenirs* (10) are perhaps rather historical than geographical, and deal chiefly with the recent Kanak rebellion, in which the author, as commander of a French man-of-war, took an active part. By M. Rivière's account the business must have been a more serious one than it was generally thought. It should be said that the writer is apparently a man of considerable originality of mind; and that his reflections on North America, on the status of missionaries in Oceania, &c., are worth attention. On the other hand, M. Gabriel Charmes's articles (11), reprinted from the *Débats*, are little more than average newspaper "copy" of the picturesque variety. The author may be remembered as having recently given a very unfavourable account of our occupation of Cyprus; and a perusal of this book is rather useful as supplying spectacles through which to read that testimony. The *Voyage de M. de Lesseps* (12), uncle of the M. de Lesseps of to-day, and companion of the ill-fated La Pérouse in the early part of his expedition, is a well-written account of his journey home, ninety years ago, across Siberia.

M. Marc Monnier has written a pleasant book (13) on an interesting but rather dangerous subject. He believes in comparative mythology, but does not see all things in the dawn and the sunset.

In one sense *Les lettres d'Éverard* (14), which form the chief part of a new volume of Lanfrey's reprinted works, may have deserved republication as indicating a state of mind which was undoubtedly prevalent among some earnest Frenchmen under the Second Empire. In themselves, however, they are rather dull, and are penetrated by a kind of political sentimentalism of which, it is to be hoped, the day is past and gone.

M. Camille Pelletan's *Semaine de mai* (15) is a long and acrimonious pamphlet, going to prove the atrocities committed by the party of order in putting down the Commune.

In *Les femmes des Tuileries* (16), as in numerous volumes with not dissimilar titles which he has previously published, M. Imbert de Saint-Amand gives a kind of picturesque and popular historical essay. The events connected with the building upon which M. Pelletan's injured friends bestowed their tender mercies naturally give ample scope for this kind of treatment.

A very good translation has appeared of Herr Karl Hillebrand's book on France and Frenchmen (17). Those to whom French is easier reading than German will find here much acute observation of life and much obtuse criticism of literature.

There have been published the third edition (18) of the *Dictionnaire des professions*, an elaborate guide for the youthful Frenchman and his parents in his choice of a *métier*, and a rather useful book of reference for foreigners; the third and fourth *fascicules* (19) of the *Dictionnaire des contemporains*; the first part (20) of a translation of Curtius's Greek History; and a fresh volume, devoted to financial matters (21), of M. Quantin's useful *Bibliothèque parlementaire*.

We may notice two monographs on points of French etymology and orthoepy, both, it would appear, written by foreigners. M. Mende's study (22) of the pronunciation of the mute *e* has the valuable endorsement of M. Legouvé. M. Schapiro's pamphlet (23) contains some ingenious and erudite notes on the names of weapons, such as bayonet, &c.

M. Maurice Bouchor, if his poetical work has not quite justified the promise of originality with which he announced himself some years ago, deserves at least the praise of possessing a certain spirit and verve which are not always present in the work of contemporary French poets. The worst of it is that, after addressing lively reproaches to his brethren of the *Parnasse* for their shortcomings, he has, with a difference, fallen into very nearly the same shortcomings himself. These *Contes parisiens* (24) have indeed much more life in them than the work of the ordinary followers of Baudelaire, of M. de Banville, or of M. Leconte de Lisle. But they are no less second-hand. M. Bouchor's models are, it is true, taken from the early and brilliant attempts of the romantic school rather than from its later and less original accomplishments. But he clings to his model nearly as timidly as the most starched *Parnassien*. But for "Namouna" and "Don Paez," and "Albertus," we should assuredly never have had these *Contes*, and we are afraid that there is nothing in them which promises a *Nuit d'octobre*, or a *Comédie de la mort*, much less an *Andalouse* or a *Barcarolle*. Still it

must be admitted that they are livelier than such work as that of which M. Armand Silvestre (25) is a fairly typical master. M. Silvestre is quite irreproachable from the technical side, but from any other he is open to destructive assaults. There really is not the least reason in the world why any one who has read *Les fleurs du mal*, or *Les odelettes*, should read these *Ailes d'or*. So also the weakness as well as the strength of the Parnassiens is shown in the reprint of two of M. Sully Prudhomme's works (26). M. Sully Prudhomme is an excellent artist, but he is painfully destitute of humour, and his prose preface exhibits the fact glaringly. "Don't take yourselves too seriously," is the lesson which all these poets have to learn, and we are not quite certain that M. Bouchor, despite his Rabelaisian *allures*, is not as much in need of it as his brethren. M. Oudéis's prettily printed epigrams (27) are less open to the charge of priggishness. But they are for the most part epigrams much more after the fashion of the excellent Davies of Hereford in James I.'s time than after that of Martial.

It is almost a pity that M. About's return to his first works should be accompanied, as it is, by a very strong reminiscence of his last. *Le roman d'un brave homme* (28), though as well written and as interesting as we might expect, is disfigured by not a little political and national partisanship which would be much better away. Still it has in its favour its author's excellent narrative power, his capital faculty of writing French, and his acute observation of the men and things of the last forty years in France. The contrast between the breadth and freedom of such a book, the heroine of which is of a type hardly yet attempted by any true-born Frenchman, and only yet attained by M. Cherbuliez, and the unhealthy miasmatic atmosphere of the narrow space in which the ordinary French novelist confines himself, could hardly be better shown than by *Les amours d'un pianiste* (29). M. Audeval has talent, and in his handling of the eternal trio he displays it; but it is, after all, a case of "damnable iteration." In *Le mari* (30) M. Ernest Daudet, after condescending to comedy in his last novel, tries tragedy. A double murder, or attempted murder, at the peaceable hotel of the "Pomme d'Or" in Jersey, opens the book, and a little madness and the like finish it. Unluckily standards of morality differ, and the conduct of "Le Mari," which includes deliberately planned assassination without the possibility of defence on the victim's part, perhaps seems less admirable to us than it does to M. Daudet. M. Glatron dedicates his book (31) to M. Challemel-Lacour with a rather pompous expression of thanks to the latter for having accepted his first work in such a newspaper as *La République Française*. *La nièce du curé* is carefully written and not destitute of power. But we shall hardly be uncharitable in suspecting that the extremely unfavourable picture drawn of the curé had not a little to do with the acceptance by the *République Française* of the niece. *Après la faute* (32) is the history of a very ill-tempered young woman and an erring but badly treated young man, while *La chasse aux Nihilistes* (33) utilizes for the purpose of a very sensational novel the recent attempt to blow up the Czar's train. In *La Russie rouge* MM. Tissot and Améro have collaborated to produce another Russian novel (34), full of the local colour which M. Tissot knows so well how to apply. The author of *Claude Aubertin* has for the moment renounced his attempt to distance his revered masters MM. Zola and De Goncourt on their own course, and has fallen back (35) on what may be called the *Roman agent de change*, for the origin of which Balzac is perhaps responsible. The ordinary ground of the realists is quartered over yet once more by M. Rude (36); but in *Les drames à toute vapeur* (37) M. Debans has produced a collection of extravaganzas not unworthy to rank with M. Champfleury's masterpiece. The tale called "Sombreker," the story of an engine-driver who goes mad on his engine, and determines to steam away indefinitely, and that entitled "Master Go Ahead," telling how a Yankee brother of the craft took a train loaded with powder into the thick of a battle in the Civil War, are really excellent of their kind.

(25) *Les ailes d'or.* Par Armand Silvestre. Paris: Charpentier.

CONTENTS OF No. 1,287, JUNE 26, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

A LADY wishes to RECOMMEND the SCHOOL where her Two Daughters have finished their education. Sixteen Pupils received, all daughters of gentlemen of position. House large; situation healthy; near London. Educational advantages great. Health and comfort of Pupils considered. Terms from 150 to 200 Guineas a year.—For particulars, &c., apply to Mrs. HALDANE, Clatto, Cupar Fife, N.B.

HOLIDAY HOME for PUBLIC SCHOOL BOYS and others at ILFRACOMBE, under the care of experienced University Masters.—Apply to SECRETARY, Chardstock College, Chard.

UNIVERSITY MAN, Old Rugbeian, Assistant-Master in a Public School, desires a HOLIDAY TUTORSHIP.—Address, H. W., St. John's Foundation School, Leatherhead.

WANTED, an Engagement as SECRETARY or STEWARD, to a Member of Parliament, or other Gentleman, by a well-educated and skilful Business Man.—Address, G. E., 26 Ellington Street, Liverpool Road, N.

TO BE LET, FURNISHED, for a long or short term, a Gentleman's HOUSE, in South Kensington, containing Dining, Drawing, and Breakfast Rooms, Four Bedrooms and Dressing-room, and good Domestic Offices. Rent moderate.—Address, A.B., 28 Southampton Street, Strand, W.C.

ENGLAND to AUSTRALIA in FORTY DAYS.

ORIENT LINE.

The following Royal Mail Steam Ships, belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.
ACONCAGUA	4,107	600	LIGURIA	4,666	750
CHIMBORAZO	3,847	550	LUSITANIA	3,825	550

Howard Gilliat, Esq.	Robert Ryrie, Esq.
Henry Goschen, Esq.	David P. Sellar, Esq.
Edwin Gower, Esq.	Colonel Leopold Seymour.

NOTICE is hereby given that the Fifteen days of grace allowed for renewal of Midsummer Policies will expire on July 9.

The Directors invite applications for Agencies for the Fire and Life Departments.

Prospectuses, copies of the Fire, Life, and Marine Accounts, and all other information can be had on application.

JOHN P. LAURENCE, *Secretary*.

LAW LIFE ASSURANCE SOCIETY,

FLEET STREET, LONDON.

Trustees.

The Right Honourable Baron CAMPBELL.
The Right Honourable Viscount CRANBROOK.
The Right Honourable Lord Justice THESIGER.
The Honourable Vice-Chancellor Sir CHARLES HALL.
WILLIAM FREDERICK HIGGINS, Esq.
EDMOND ROBERT TURNER, Esq.

Directors.

Edward Bailey, Esq.	Holdsworth Hunt, Esq.
Francis Thomas Bircham, Esq.	John James Johnson, Esq., Q.C.
The Hon. Hallyburton G. Campbell.	William Rolle Malcolm, Esq.
John Clerk, Esq., Q.C.	Richard Nicholson, Esq.
Frederick George Davidson, Esq.	Charles Manley Smith, Esq.
John Deedes, Esq.	John Swift, Esq.
William James Farrer, Esq.	The Right Hon. Lord Justice Thesiger.
Henry Ray Freshfield, Esq.	Edward Tompson, Esq.
Sir Farrer Herschell, Q.C., M.P.	Sir William Henry Walton.
William Frederick Higgins, Esq.	Arnold William White, Esq.
Grosvenor Hodgkinson, Esq.	Basil Thomas Woodd, Esq.

Invested Assets on December 31, 1879	£5,[illegible],781
Income for the year 1879	474,[illegible]
Amount paid in claims to December 31 last	12,339,467
Reversionary Bonus allotted for the five years ended December 31 last	675,853
Aggregate Reversionary Bonuses hitherto allotted	6,198,991

The expenses of Management (including Commission) are under 4½ per cent. of the Annual Income.

Attention is specially directed to the revised Prospectus of the Society; to the new rates of premium, which are materially lower for young lives than heretofore; to the new conditions as to extended limits of free travel and residence; and to the reduced rates of extra premium.

Loans are granted on security of Life Interests and Reversions in connexion with Policies of Assurance.

Prospectus and Form of Proposal will be sent on application.

GRIFFITH DAVIES, *Actuary*.

EQUITABLE LIFE ASSURANCE SOCIETY.

ESTABLISHED 1762.

MANSION HOUSE STREET, LONDON.

The Oldest Life Office on the Mutual System in the World.

The Invested Funds of the EQUITABLE are upwards of £4,000,000, being more than 26 times its renewal premium income.

The recent division showed a clear surplus of £1,893,700, after providing for all future claims.

The effect of the distribution was to make a total addition of 257½ per cent. to Policies taken out in 1817, of 172½ per cent. to Policies taken out in 1827, of 135 per cent. to Policies taken out in 1836, of 101½ per cent. to Policies taken out in 1846, of 74 per cent. to Policies taken out in 1856, of 31½ per cent. to Policies taken out in 1866, and 10 per cent. to Policies taken out in 1874.

The addition to Policies taken out in 1861 was sufficient, if so applied, to extinguish all Premiums payable during the next ten years; whilst Policies taken out in 1856 could also extinguish their Premiums in like manner, still retaining an increasing bonus of 40 per cent. on the sums originally assured.

Premiums may be paid in one sum, or for a fixed period, so as to cease after a given number of years.

The whole working expenses of the Society average about 2½ per cent. on its gross annual income.

It has never allowed commission or employed agents, whereby more than £2,000,000 have been saved to the assured.

J. W. STEPHENSON, *Actuary*.

THE IRISH LAND BILL.

THE curiosity with which the second night's debate on the Irish Disturbance Bill had been expected was chiefly concentrated on Mr. GLADSTONE's speech and on the division; but Mr. GIBSON's forcible denunciation of the Bill and Lord HARTINGTON's reply excited considerable interest. Mr. CARTWRIGHT, Mr. BRAND, and Colonel KINGSCOTE, and, in a later debate, Mr. ALBERT GREY, had the opportunity of expressing the uneasiness which the measure has produced in the minds of many of the supporters of the Government. Mr. GLADSTONE abstained from repeating the attacks on landowners which had formed the substance of the Irish ATTORNEY-GENERAL's alarming and mischievous speech. With better judgment, Mr. GLADSTONE endeavoured to reduce the importance of the measure to the lowest point, by contending that the landlord retained unimpaired all his remedies but one; and that he was not even nominally or absolutely deprived of the power of eviction. He even accepted the principle of an amendment to the effect that the Bill shall not apply to the case of landlords who are willing to allow the tenant to sell his interest in the land; and his extemporaneous concession has since been embodied in Mr. LAW's Amendment. By this sudden alteration of the Bill, the Ulster right will be introduced into the scheduled districts, to be hereafter extended to the rest of Ireland. This perhaps is a part of the debt which, in Mr. GLADSTONE's reckless language, has long been accumulating against the Irish landlords. No single phrase could be better calculated to encourage projects of spoliation. Neither Mr. GLADSTONE nor Mr. FORSTER succeeded in dispelling the belief that the measure had been suddenly devised for the purpose of meeting the demands of the Irish agitators; and both of them have repeated more than once the mysterious intimation that a more comprehensive measure will be introduced in a future Session. Nothing was more remarkable in Monday's debate than the silence of Mr. PARNELL and his colleagues, who would scarcely have been satisfied if they shared Lord HARTINGTON's opinion that the measure has no tendency to prevent the payment of rent or to disturb the foundations of property. As Mr. PARNELL truly stated on a late occasion, the Bill is borrowed from Mr. O'CONNOR POWER, with a colourable change in the limitation of time and place which in no degree affects its principle. The purpose of the original measure was undoubtedly to prevent the present payment of rent, and not merely to prohibit eviction. Mr. GLADSTONE and other Ministerial apologists wasted time in discussing other ostensible methods of recovering the rent. If there were in any case subject-matter for a distress, or a prospect of recovering the debt by ordinary process, the tenant would have no need to fear eviction. It is known that in many cases the notice of eviction is a mere ordinary form by which immediate payment is obtained.

Notwithstanding much ingenious reasoning, the character of the Bill is clearly defined by the consent of supporters and opponents. No equally significant interference with proprietary rights has at any former time been attempted by Parliament. It is true that, as Mr. GLADSTONE said, the tithe settlement of forty years ago was in one sense a precedent of arbitrary legislation. One-fourth of the property of the tithe-owner was transferred to the landlord, on condition of his relieving the occupier from the liability. It is true that neither party was ostensibly consulted; but the consent of both was assured, and consequently taken for granted. The landlords received a large bonus, and the tithe-owners, consisting principally of the clergy, were rescued by the Act from a condition of extreme and hopeless distress. In the present case there is no similar consent on the part of the victims of anomalous legislation. The numerous instances which have been quoted of the refusal of loans and advances, in consequence of Mr. FORSTER's Bill, were not answered by Mr. GLADSTONE's reference to the frequent exclusion of Irish securities from the powers of trustees. In the cases which have lately occurred proposals for loans had actually been accepted, when the transactions were suddenly rendered abortive by the appearance of the Bill. The depreciation of the security, and therefore of the value, of property is not confined to the scheduled districts. The readiness of a Government with an irresistible majority at its back to tamper with the rights of property causes a feeling of uneasiness which extends beyond the scheduled districts and beyond Ireland. The opponents of the measure were taunted with their imprudence in promoting the conspiracy against the payment of rent which they apprehended and foretold. In the same manner protests against any project of spoliation tend to encourage the cupidity of those who are likely to profit by an act of injustice. The authors and supporters of the Bill are responsible for the consequences of the alarm which they have caused. Their indifference to justice is illustrated by their application to the anti-rent Bill of the schedule of the Bill for the Relief of Distress. In many cases districts were properly included in the schedule for the purpose of providing employment for labourers who had no land in their occupation. The farmers now profit, at the expense of their landlords, by the accident of living in a district where relief works were provided.

The Government may probably continue to rely on its majority, notwithstanding the threatened loss of Irish support; but the division lists are highly significant both in the names which they include and in the catalogue of Liberal absentees. Lord HARTINGTON is constantly vouched by his party as a witness against the charge of subversive tendencies; but a Minister who is not disposed to break with his colleagues must often prefer political considerations to personal opinion and inclination. Lord FREDERICK CAVENDISH is also a member of the Government. Lord EDWARD CAVENDISH declined to vote for the Bill. It may be added that, although Lord HARTINGTON deserves the high character which he bears, he has on two occasions committed grave and possibly ruinous mistakes. In looking over the list of Liberal dissentients and absentees, Lord HARTINGTON may perhaps have regretted to find the names of nearly all the great proprietors belonging to the party, or of the members of their families. Sir JOHN RAMSDEN, Mr. PORTMAN, and Mr. GREY voted against the Bill. Three members of the FITZWILLIAM family, the eldest son of the Duke of BEDFORD, the eldest son of the Duke of SUTHERLAND, and the eldest son of Lord WENLOCK, declined to support the Government. Still more significant is the resignation of Lord LANSDOWNE, who has from his entrance into public life been a consistent Liberal. The Liberal opponents of the Government in Monday night's division, and those who withheld their support, numbered eighty, and the argument drawn from their defection is not answered by sneers at aristocratic prejudice and selfishness. Rightly or wrongly,

the malcontents agreed with Mr. PARNELL and Mr. BIGGAR in their conviction that the Bill involved a dangerous interference with property. The large majority which nevertheless carried the Bill greatly aggravates the alarm which is not exclusively caused by the Irish measure. Another assault, rendered more offensive by the manner in which it was delivered, has reminded English landowners of the dangers to which they are exposed in the presence of a Government pledged against their interests and rights.

The evening journal which has lately become the organ of extreme or revolutionary radicalism, commented by anticipation on the schism in the Liberal party which is disclosed by the division on the Disturbance Bill. Mr. GLADSTONE, as the writer thoughtfully and justly observed, will have an arduous task in carrying democratic measures through a plutocratic House of Commons. It may be incidentally remarked that plutocracy means, in the revolutionary dialect, the possession of power by the upper and middle sections of society, as distinguished from the classes which live on weekly wages. The actual plutocracy consisting in the social condition of members of the House of Commons is largely tempered by the influence of constituencies, which more and more incline to supervise and limit the independence of their representatives. It is nevertheless true that an Assembly of members generally possessing a competence is likely to regard measures of spoliation with distaste. The writer proceeds to argue, with much plausibility, that Mr. GLADSTONE would do well to pass a new Reform Bill before he proceeds with his attacks on property in land. It is interesting to find that a zealous and candid partisan has no doubt as to the policy of the Minister who has proposed the Hares and Rabbits Bill and the Disturbance Bill. The fears of the extreme alarmists are, in the view of their avowed enemy, fully justified by the facts. Disregarding the earnest professions of Lord HARTINGTON, of Mr. FORSTER, and of Mr. GLADSTONE himself, the theorists who claim to abolish or largely to modify the rights of owners assume as too clear for argument the proposition that pending measures are but instalments of a systematic interference with landed property. It is probable that their aspirations will not be gratified until Parliament is packed for the purpose by a further degradation of the suffrage. Their well-founded hopes illustrate the gravity of Lord HARTINGTON's error in binding the party of which he was then the leader to the support of household suffrage in counties. No other measure announced by the present Government is so deeply and organically dangerous. It is possible that some moderate Liberals may retract a thoughtless concession, when the measure which they had persuaded themselves to regard as harmless is openly demanded by the revolutionary faction as a condition of successful violation of the rights of property. The obedience of the bulk of the Liberal party has been severely strained by the demand that they should vote for a measure which was borrowed from the Irish Land League. The most independent Liberals refused to follow the Minister, and it is probable that on future occasions the plutocracy may be more generally mutinous. If Mr. GLADSTONE fails to control his followers through the Liberal Associations in the boroughs, he will probably in the next Session follow the advice of the journalist who urges him to introduce a new Reform Bill. It may be hoped that the late dissentients, representing the Liberal aristocracy, will offer some resistance to a measure which will be designed to purge the House of Commons of themselves and their class.

EUROPE AND TURKEY.

THE Berlin Conference accomplished its task with ease and rapidity, but it remains to be seen how its decisions are to be carried into effect. The plenipotentiaries and their assistants have, in accordance with their instructions, altered the map which describes the territories of Greece and Turkey; and their Governments have embodied their recommendations in the form of a collective Note. The six Powers had previously agreed on a principle which left little discretion to their representatives. The provisions of the Berlin Treaty were to be more clearly defined in the sense which had at the time been attached to the document by M. WADDINGTON. The French Minister had openly undertaken the defence of Greek interests, which were, for some unknown reason, not favoured by the English plenipotentiaries. It was generally understood that Greece was to obtain a considerable portion of Epirus and Thessaly, but it was left in doubt whether the frontier should follow the line of the rivers which run east and west, or the northern and southern watershed. The claim of Greece to the possession of the important town of Janina was disputed on the ground that the population was chiefly of Albanian origin, while it was urged on the other side that it had become essentially Greek in language and manners. It would have been more convenient that the details of the question should be finally settled at Berlin; but it was probably found impossible to arrive at an agreement, and the delimitation of territory was remitted to the States concerned in the dispute, with but a vague probability of their agreeing on a frontier. The Turks, as might be expected, placed every difficulty in the way of a cession of territory which appeared to them both undesirable and intrinsically unjust. The Greeks were not disposed to make a compromise of claims which, as the result has proved, were likely to be granted in full when the Powers should be ultimately driven to mediation.

The present English Government so far assumed the initiative as to propose that the plan of M. WADDINGTON should be the basis of a settlement. It was obvious that the suggestion must be acceptable to France; and the other Powers seem to have felt little interest in the question. Nearly the whole of Epirus and Thessaly, including both Janina and the coast opposite Corfu, have been prospectively detached from the Turkish Empire and assigned to Greece. The kingdom will, when the scheme is realized, receive an augmentation of nearly half a million of subjects, the great majority being Greek in race and religion. There can be little doubt that under Greek rule the population will be more contented and better governed, but the settlement is not likely to be final. The same grounds on which the cession has been recommended will apply to the islands and to some of the continental districts; and probably at no distant date the kingdom will receive further additions, either by means of successful war, or, as in the present instance, by way of reward for abstaining from aggression. It is also possible that eventually a friendly understanding between Greece and Turkey may be founded on a common antagonism to Bulgarian pretensions; but for the present the relations of the two States will be severely strained. Former Congresses and Conferences have for the most part had at their disposal immediate means of executing their decrees. In 1878 Turkey was in no position to resist the dictates of the Powers; for Russia and Austria promptly suppressed opposition in the provinces which they respectively undertook to occupy. It is hardly possible that the Powers which took part in the Conference of Berlin can have intended to give occasion for a war between Greece and Turkey, but the means by which the risk is to be averted have not been hitherto disclosed. Precedents might be found for a forcible disturbance by the Great Powers of territorial arrangements for reasons of expediency, even when they were not, as in the present case, reinforced by sentimental considerations. The most analogous precedent is furnished by the separation of Belgium from Holland, when a French army with the consent of England besieged and took Antwerp, which the Dutch commander refused to evacuate. The dissolution of the Kingdom of the Netherlands as it had been constituted after the close of the great war was as unwelcome to England as it was gratifying to France; and Russia, Austria, and Prussia, then united in the Holy Alliance, would gladly have suppressed a revolutionary movement; but Lord PALMERSTON saw from the first that Belgium, on the refusal of independence, would seek annexation to France, and he was determined, as far as possible, to maintain the barrier which had been erected against French ambition.

Some politicians may be inclined to discern in the aggrandizement of Greece a similar provision against the extension of Russian influence; but other motives have led the Governments to concur in recommending to Turkey a cession of territory to Greece. The French remember with pride their share in the battle of Navarino, and the expulsion of the Egyptians from the Morea by a French army. They were also anxious during the Congress of Berlin to resume their position in the Councils of Europe; and the Greeks, then grievously in want of a patron, supplied the desired opportunity. Germany, though

comparatively neutral, has always regarded the Turks with contemptuous dislike, and Austria could scarcely stipulate for the integrity of the SULTAN's dominions on the eve of her own occupation of Bosnia and Herzegovina. The Russian Government, though it had not been forward to support the pretensions of Greece, was not disposed to be outbid in proposals for the dismemberment of Turkey. The present English Cabinet, or its chief, is probably actuated by sympathy with the aspirations of Greece, which is rendered warmer by antipathy to the Turkish Government and religion. The liberation of a remaining portion of the subject races will probably improve the condition of the provinces which are to be transferred. The Albanians who form a part of the population have long been within reach of Greek influence, and there is no reason to suppose that they cherish obstinate loyalty to the SULTAN. Those who formerly deprecated the gradual partition of Turkey are forced to recognize the results of the Russian victories. It has become necessary to consider how the inheritance is ultimately to be divided, and of all the probable claimants Greece is open to the least objection. Unlike the Slavonic principalities, the Greek kingdom has seldom courted the protection of Russia, and none of the neighbouring communities possess the same political and commercial aptitude.

The question remains, whether measures have been taken for procuring or enforcing the acceptance by Turkey of the authoritative interpretation which has now been given to the Treaty of Berlin. Mr. GLADSTONE, conventionally or ironically, declares that it would be discourteous to express a doubt of the deference of Turkey to the demands of united Europe; but there is little doubt that the Turkish Government will, in the first instance at least, refuse or withhold submission to the collective Note. Even if the Porte were unexpectedly to profess a more compliant disposition, the policy which was employed against Austria, and with better success against Montenegro, would not fail to be repeated. The Albanians of Epirus might be induced to offer an independent opposition to the compulsory transfer of their allegiance; and Imperial troops stationed in the district would probably encourage the resistance which they might nominally undertake to suppress. Although peace was officially supposed to exist between Austria and Turkey, the occupation of Bosnia and Herzegovina was only effected after serious hostilities by an army of a hundred thousand men. The territory which had been assigned to Montenegro by a compromise is still in the possession of the Albanian insurgents. The Greek army has of late been largely reinforced, but it consists almost entirely of raw recruits who can be no match for Turkish veterans. The inhabitants of the districts which are to be ceded will scarcely run the risk of an insurrection, when they may reasonably hope to attain their liberation by European assistance. At present it is not known that any preparation has been made to execute the sentence delivered at Berlin. Rumours of movements of the English and French Mediterranean fleets are formally contradicted; and there is no probability of any movement of troops by Austria, Germany, or Russia. Perhaps there may be some unexpected solution of a difficulty which must have been foreseen. The insurrection which is threatened in East Roumelia, under Russian officers, may perhaps induce the Turks to be more yielding on the side of Greece. Their complaints of the utter disregard of the stipulations which were made in their favour at Berlin will receive little attention. Although some political writers have suggested that a successful war might increase the reputation and confirm the national reputation of Greece, it is impossible to suppose that the Great Powers would have deliberately planned a costly and doubtful struggle. The Ambassadors at Constantinople may perhaps have been instructed to apply some kind of pressure which may be strong enough to overcome the repugnance of the SULTAN to a cession of territory; but the means which can be employed are not obvious. The English Government, unless all its professions have been worthless, will not be disposed to go to war with Turkey even under the influence of the most benevolent motives. The late Ministers will perhaps regard not without complacency an embarrassment which, when they were in office, they hesitated to incur.

BUENOS AYRES.

THE latest news received from Buenos Ayres seems to show that the civil war which was a consequence or an incident of the election of a President for the Argentine Confederation has been brought to an end. The Confederation consists of the province and town of Buenos Ayres, and of thirteen inland provinces. Buenos Ayres wanted to have the President of its choice, and the inland provinces wanted to have the President of their choice. If this, however, had been all, there would have been nothing specially to notice in an occurrence so ordinary in the history of South American Republics as a military contest over a Presidential election. Every four or six years there is a scramble for the plunder of office, and the only way to win in the scramble is to be stronger than any other candidate. Nothing can be a greater curse to a country than to have Presidential elections of this type. But it is much easier to deplore the evil than to show how it is to be remedied. No form of government, except that of a Republic, is possible in the American colonies of Spain. There are no elements out of which a stable monarchy could be composed. Either a foreign or a native sovereign would be shot as soon as he gave a chance to his enemies. A military dictatorship may be created, and Buenos Ayres, as well as most other of these Spanish Republics, has tried such a dictatorship. But it is only a question of time. Sooner or later, the military dictator must fall, and even while his rule lasts, the country, although actual disturbances may be suppressed, undergoes every other inconvenience which a Presidential election brings with it. There is a perpetual condition of siege, and every one lives in a state of suspense, not believing in the military dictatorship as good in itself or as likely to last, but merely waiting until it is over. The peculiarity of the Spanish Republics is that there is a population to make revolutions, people who are willing to fight and, if necessary, to die for the chance of getting a little temporary plunder on their own account, and with the object of securing a longer term of plundering for those who bring them together. But there is no population to object to revolutions. In the United States there is a vast number of thriving, law-abiding men who are determined that the Presidential election shall not degenerate into a military contest, and who are able to impose their will on the whole Union. There is no such population in the South American Republics. Vast tracts of land are held by lonely settlers, who are absorbed in the task of constantly protecting their own lives, and cannot be brought together in order to put down a revolution. They leave the game of politics to be played by the professionals, and are mainly anxious that the professionals should play their game quickly, and decide who is to be the winner. Still all South American Republics are not alike. Some are better, wiser, richer, than others. Chili has little to be ashamed of. But in Chili there is much wealth and industry, the population is of a higher type, the influence of foreigners is strong, and there has been for many years a Government conducted by an aristocracy at once capable and respected. Mexico is in some respects better than it was, for there too foreign capital is beginning to tell, and there is a President sufficiently strong to have a fair prospect of being able to avoid a civil war by securing the election of the man of his choice. In the Argentine Confederation there has in recent years been an enormous immigration, chiefly of Italians, and although there has been a severe financial crisis, the country has within the last twenty years made an enormous stride towards prosperity. It is probably owing to these causes that the recent struggle has been so quickly terminated.

But it is said that the struggle has not been of the usual type. It was not merely a contest to decide which of two candidates should be President, but it was really meant to decide whether the Confederation should or should not be broken up. Buenos Ayres wished to secede, and its President was to be President of one province and not of fourteen. The struggle was therefore like that which followed the election of President LINCOLN, and not like the struggles so familiar to the inhabitants of Peru and Mexico. In old days Buenos Ayres was an independent Republic. Then it joined the Argentine Confederation, and now it is said to be tired of the union, and desirous of setting up again for itself. It complains that as a member of the Confederation

it is very badly treated. The city itself is three centuries old and contains nearly 200,000 inhabitants. The province is rich and is full of enterprising settlers. What the city and the province complain of is that they are ground-down with taxation in order that the thirteen inland provinces may thrive on their misery. While the taxation in Buenos Ayres is 11*l.* per head, in the other provinces it is only six shillings a head, and Buenos Ayres has to stand this weight of taxation because the interest must be paid on loans with which railways and telegraphs and wells have been made in the interior. The population of the city and province may be roughly stated at one third of the total population of the Confederation, and thus, as it is alleged, one third pays for the other two thirds. Buenos Ayres objects to this, and would like to keep its money for itself. Accordingly when a new President was to be elected, it announced that it intended to have a President of its own, and that the thirteen other provinces might have any President they pleased so long as they kept aloof from Buenos Ayres. The other provinces replied that they would not allow Buenos Ayres to secede, and that their President would enter the city at the head of his troops if he could not enter it otherwise. To them it is a matter of life and death that Buenos Ayres should remain in the Confederation. It only needs a glance at a map to see why this is so. These provinces, with an area said to be eight times as large as France, have no outlet to the sea except Buenos Ayres. The harbour of Buenos Ayres is not a good one, and gets worse as it is being filled up with alluvial deposits. Still it is a harbour, and there are all the appliances for loading and unloading freight. Vast as is the territory of the Confederation, it has no seaboard except at Buenos Ayres. Monte Video is superior to Buenos Ayres as a port; but then Monte Video is in Uruguay, not in the Confederation; and, even if arrangements could be made for using Monte Video, the inland Argentine provinces are cut off from it by the enormous rivers of the Parana and the Uruguay. The whole commerce and the whole future of these provinces would be at the mercy of Buenos Ayres if Buenos Ayres were allowed to become independent and hostile.

It is difficult to find even a shadow of justification for the pretensions of Buenos Ayres. The quarrel between Buenos Ayres and the Confederation is an old one, and there have been many fights to bring it to a conclusion. In 1861 Buenos Ayres gained a decided advantage, and its President was left in possession of the field. It then offered to come to terms. The President was made the President of the whole Confederation into which Buenos Ayres entered, and the Customs revenues of the city were formally given over for the support of the National Government. This was the arrangement made by Buenos Ayres itself in the hour of victory. It saw that the only possible chance of permanent peace was to throw in its lot with the provinces. And the immediate effects of this prudent concession were most satisfactory. A tide of immigration set in, fortunes were rapidly made, and the revenue was doubled in a few years. Unfortunately, the Confederation found it too easy to borrow, and when it got into difficulties it had recourse to forced loans. Its treatment of the Bank of Buenos Ayres was sheer robbery; but it may be observed that to this impudent swindle the local Legislature of Buenos Ayres was a party. Overtrading brought on a crisis, many were ruined, and fewer immigrants were found willing to take the risk of settling in a country which seemed in a bad way. As the liabilities of the Confederation had continued to increase, new taxes were found indispensable; and thus in a time of distress people had to pay more than they had been accustomed to pay in the hour of their prosperity. But the people of Buenos Ayres had no special cause of complaint. They seem to pay much more than their fair share of taxation if the Customs revenues are included in their taxes. But they had given these revenues to the Confederation, and it is obvious that the Customs duties on goods sent into the interior are really borne by the consumers who live there. They themselves are more heavily taxed than the inhabitants of the provinces; but then they are much richer. The last device of Argentine finance has been to impose a heavy export duty on wool. This impost is not only a direct violation of the Constitution, which forbids export duties, but is most injurious to the country, as it burdens Argentine wool-growers in the competition of the European market. But, at any rate, it was expressly devised as a means of making things easier for Buenos Ayres and harder for the provinces. It is true, again, that the proceeds of the loans have been spent in railways in the provinces; but it was in the provinces that railways were wanted, and undertakings which benefit the provinces must benefit the capital. So far as Europe is interested in the matter, all its interests lie in the maintenance of the union of Buenos Ayres with the Confederation. With this union maintained there is a magnificent field for enterprise in the territories of the Confederation, and without it there would be scarcely any.

THE RADICAL WHIP AND SPUR.

ALL political observers of any acuteness predicted that the present Parliament, itself elected as a surprise, would in its course present or give rise to many surprising phenomena. The prediction has already been fulfilled pretty amply, and one not of the least remarkable of the results already accruing is the attitude of the extreme Radical party, as represented by its chief literary organ, the *Pall Mall Gazette*. It is no secret that on the very morrow of the election many members of this party openly expressed regret at the result. The country, they said, had put a Liberal majority into power without being itself prepared for extreme measures, and still more without taking care that individual members of Parliament were so prepared. The golden opportunity was thus occurring too soon—a thing as annoying to eager expectants as its occurring too late. This dissatisfaction was not appeased by the constitution of the Ministry, even though two extreme Radicals, and one only less extreme, were recruited for it from the Irreconcilable party. It was but too obvious to the believers in the Radical "Thorough" that only half measures (in their sense) could be expected from such a Ministry, and still more from such a Parliament. They have since discovered, not only that nothing but half measures can be expected, but that even these half measures cannot be "rushed" through Parliament in the manner they like. The Radical ideal of legislation is the proceeding of that famous night in the early days of the French Revolution when half the institutions of France were abolished at a sitting. Certainly the proceedings of the present Session come sadly short of such an ideal. The Government measures labour heavily in the Parliamentary sea; the crews who work them are by no means as smart as they might be, and answer the boatswain's whistle with very doubtful alacrity. Accordingly a cry of "Faster! faster!" has been set up by the Radicals, and their organ, rather to the disgust of its less thoroughgoing allies, has not merely emitted this cry very sharply, but has devised some remarkable constitutional theories in support of it. Last Saturday the *Pall Mall Gazette* laid down the duties of the House of Commons in the novel formula that it "can "sanction legislation, but cannot legislate." On Monday this abstract principle was commented on and completed by a more practical suggestion. Our contemporary in effect acknowledges that the constitution of the actual House of Commons is unsuitable to the carrying of the measures which it approves. Therefore it is the duty of Mr. GLADSTONE, "by a change in the construction of Parliament, "to bring it into harmony with what, *rightly or wrongly*, "he believes to be the wishes of a great majority of "Englishmen."

We shall take the last of those remarkable positions first, and we shall not have much difficulty in showing that it expresses simply the principle which, as we had thought, is most repugnant to Liberals. It has generally been supposed that the basis of constitutional government is an appeal, at periods sufficiently frequent, but not excessively so, to the people, to declare their views through their representatives. But it is evident that, if this process is to have any value, the machinery of representation must not be tampered with. Such tampering is, in plain language, what the *Pall Mall Gazette* recommends. Every Government, and not merely Mr. GLADSTONE'S, must in fairness be supposed, "rightly or wrongly, to believe" its own wishes and views to be the wishes and views of a majority of the people. Such a belief may be false, absurd, preposterous; but on the face of it the benefit of its possible existence must be allowed to the culprits. Even the *Pall Mall Gazette* will probably allow that the late Govern-

ment, for instance, had this belief in reference to their foreign policy. The principle now advanced would, therefore, have justified Lord BEACONSFIELD in manipulating the constituencies in any way most likely to secure a majority. It justifies the French Empire, the special incarnation of all that is fiendish to those of the *Pall Mall Gazette's* way of thinking. But this consideration is as nothing compared to the consideration of the evils that would attend the recognition of such a principle. The notion that the whole political system is to be turned topsy-turvy every time that a strong-willed legislator finds a difficulty in persuading the representatives of the people to share his views would, if an enemy instead of an apostle of Radicalism had announced it, have been deemed a party caricature. The same may certainly be said of the other notion about its being the duty of the House of Commons merely to sanction or to veto cut-and-dried legislation. This again is a fine Napoleonic idea, but it is not one originally due to any NAPOLEON. The *Pall Mall Gazette's* notion of a perfect legislative assembly is apparently the Scottish Parliament of the seventeenth century, with its ingenious arrangement of preliminary "Lords of the Articles." The function of these latter personages is, we suppose, to be performed by the Cabinet, who in their wisdom will elaborate measures in detail, and present them to the House to take or to leave. In the case of the House accepting the latter alternative, the Government whose wisdom has been slighted will of course fall back on the "attempt to bring Parliament, by a change in "its construction, into harmony," &c. If this is not personal government, pure and simple, we really do not know what is. Certainly neither NAPOLEON I. nor NAPOLEON III. would have had the slightest objection to it; nor can we imagine that the most despotic of monarchs or of Ministers would wish for anything better. That, by adoption of such a system, everything most characteristic of the English Constitution and of the kind of government which, whether under an expressed constitution or not, has almost constantly prevailed in England, would disappear, is evident at once. Probably its advocates, if they chose, in FONTENELLE's phrase, to give us their handful of truth, instead of letting some escape at the little finger, would acknowledge this. They are, to do them justice, "thorough." They desire the prevailing of certain crotchets, and the shortest means to that end are the best. That the means would in all probability, and certainly according to all experience, lead to a very different end, is a point which they prefer to leave out of consideration.

We are afraid we cannot congratulate the Radicals on the practical wisdom of this desperate haste of theirs. In the first place, the principles which we have been discussing, though not at all likely to startle their political opponents, who are quite prepared for them, are very likely to startle the denounced "plutocrats" of their own party. In the second place, impatience of this kind seems to argue a certain consciousness of weakness. If the changes they desire are really, as they so confidently pronounce them to be, required by the country, it is quite certain that they will come about sooner or later. The threat administered in Cromwellian style to the present Liberal majority does not look like a certainty of this fact. It looks rather like the determination expressed in the familiar phrase "Now "or never." It is moreover particularly unwise, because the Government have already been trying the patience of their supporters, as indeed the contention of the *Pall Mall Gazette* admits, very severely. A study of certain recent debates and division lists shows this beyond a doubt. Now it is never wise to drive any body of men, and least of all a body of Englishmen, into a corner. It is not probable that the Liberal majority, just returned, as they have been over and over again told, by a great majority not merely of the electorate, but of the non-electorate, will be seriously frightened by this threat of a change in the construction of Parliament, over which change they themselves have control. The *Pall Mall Gazette* seems to forget this latter fact, as well as the possibility that a new election might be by no means so favourable to its hopes as the last. Thus, taking things altogether, the menace is something of a *brutum fulmen*, reminding one ot the terrible things with which a scolding nurse is wont to threaten naughty boys. On the other hand, it plays directly into the hands of the Conservatives. "Here," they can say, "is what we always told you. We have been "accused of presumption in calling ourselves the Constitutional party, and here are our opponents threatening "not merely details of the Constitution, but its whole "body, soul, and spirit. We have been accused of "leaning to personal government, and here are our "opponents recommending plans which are personal "government adroitly adjusted to representative forms." From every point of view, then, the suggestion must be deemed as unwise as it is intrinsically dangerous. But at the same time lovers of the Constitution can hardly be too grateful to those who thus play *cartes sur table* and rescue themselves from any possible charge of concealing their intentions. It is annoying, doubtless, to would-be destroyers to find that the work of destruction goes on so slowly. The Radicals are somewhat in the position of their revered predecessors at the epoch already referred to, who found the task of creating a new world and polishing aristocrats and aristocratic institutions from off the face of the old one interfered with by idiotic judicial and constitutional scruples. But, as we have said, it is doubtful whether they are yet strong enough for it to be wise for them to publish their disgust so loudly. As for the Government, they can only be sincerely pitied for the additional embarrassment which this excess of zeal must cause them. Their enemies are enterprising, and determined, their friends half-hearted, and in some cases openly mutinous even in these early days. Their main chance of getting the horse on is to put on him the largest possible pair of blinkers, and to drive him with the gentlest hand. Then comes the irreconcilable section of Radicals, and tears off the blinkers, exhibiting what is coming to the frightened animal, and at the same time sawing his mouth and lashing his sides. The result of the process in ordinary life would in all probability be a very decided spill. If any similar accident should happen in Parliament, Mr. GLADSTONE will have to distribute his thanks to a good many of his friends, and not the least share will be due to the too impatient Radicals.

THE GAS EXPLOSION.

ON Monday last a busy and frequented portion of London was the scene of an awful and unprecedented catastrophe. A thing that had never happened before not only took place, but took place under conditions and on a scale which it had never entered the head of the wildest alarmist to imagine. The gas exploded in a main three feet in diameter and six hundred yards long. The explosion began at one end of the main just out of Tottenham Court Road, and was repeated at one point after another until it reached the other end of the main in Howland Street. It was not continuous; but where, from some cause or other, there was a weak spot in the main there was an explosion. Wherever it showed itself the force was terrific. The roadway was hurled into the air, great granite blocks being lifted to the height of the adjoining houses and falling from the top to the bottom of the building; fronts of houses were torn out, the basements were lifted up, and in some instances only parts of the shells of houses were left standing. The ruin could not have been greater if that part of London had been bombarded. But, great as was the destruction of property, the loss of life was wonderfully small, and so was the amount of bodily injuries that could be immediately ascertained. The shock to the nervous system which must have been felt by numbers who sustained no external injury may probably largely increase the suffering attributable to the catastrophe; but very few persons were killed or seriously hurt at the moment. A foot passenger who was present has described his sensations, and has said that he was suddenly whirled from off the ground and deposited in a trench in the middle of the road; but he was so little hurt, or even confused, that he at once set to work to help out some children who had been blown into the breach with him. No flame was anywhere visible; but there is said to have been a red dust in the atmosphere, either from the rust on the pipes or from bricks reduced to powder. One eyewitness first saw this dust rise into the air, then two or three people in the street staggered and fell, then the ground shook under him, and a portion of the street in front of him shot up into the air, breaking his windows and shattering his roof. He himself was not injured. It seems natural to compare this explosion, as it was an explosion of gas, with explosions in coal-mines. But,

although the cause of danger was the same that prevails in mines, the effects of the explosion were much more like those of a bombardment. Those endangered were either struck or buried in *débris*, or they were not. There was no flame to burn them, and the air they breathed was not affected. It has often been noticed in sieges, and it was especially noticeable during the siege of Paris, that the number of people killed, and even the amount of injury caused, by a bombardment is much less than seems possible. In the same way in this gas explosion there was literally in some places a rain of large granite blocks, but the number of people who came out of this rain uninjured was wonderfully large in proportion to the number exposed to it.

Up to a certain point the cause of the catastrophe is clear, while beyond that point it has not as yet been ascertained, and possibly may never be ascertained, as the destruction has been too complete to permit much examination. The Chartered Gas Company has been for some time engaged in laying down a new main two miles long, from Goswell Road to Howland Street. The quantity of gas needed for the supply of London becomes every year greater, and the mains along which the gas is sent grow bigger and bigger, until this Company found that it wanted in this district a gigantic pipe a yard in diameter. The work at the time of the accident was in two sections. One section from Bayley Street out of Tottenham Court Road to Goswell Road was complete and in use, being therefore filled with gas. The other section was complete from Howland Street to a point a few feet from the termination of the first section, was not in use, and was supposed to contain nothing but atmospheric air. Workmen at the time of the explosion were employed in joining the two sections, but the junction was not completed. No gas from the completed section, therefore, could have found its way into the Howland Street section, the Bayley Street end of which was enclosed with a cap. A workman was doing something with this cap when the explosion occurred; but, as he was killed on the spot, no one knows exactly what he was doing. One supposition is that he was testing with a candle the end of the Howland Street section to see whether there might not be gas in the main which was escaping. Another supposition is that he was using an iron tool which struck against a flint and produced a spark. Anyhow, there was a flame which came into contact with the contents of the Howland Street main, and these contents were of the peculiar kind which make an explosion possible. An explosion can only take place when there is a combination of a certain amount of gas with a certain amount of atmospheric air, and when this combination occurs in a confined space. Evidently, therefore, instead of the Howland Street section containing only atmospheric air, it contained gas too. This gas must have found its way in at the point where the new main joined the other main in Howland Street with which it was to be connected. It was supposed that all communication was rendered impossible by a strong iron valve. Here was the mistake. The valve could not have acted as it was meant to act. It was intended to exclude gas, and it did not exclude it. In order to produce an explosion there must be, roughly speaking, one-sixth part of gas to five parts of atmospheric air, and accordingly the gas, which was not supposed to be present at all, must have entered in a sufficient quantity to form one-sixth of the contents of a pipe a yard wide and six hundred yards long. If the valve was still in existence, it might be possible to discover what was the defect in it. But it has been blown to atoms, and the exact form of the negligence to which this terrible accident was attributable can only be conjectured.

Alarming as the accident was, both from its terrible nature and from its complete novelty, those on the spot fortunately retained their presence of mind. Neighbours and policemen at once set to work to extricate sufferers, to convey them to the hospital, and to maintain order. The Gas Company took the earliest opportunity to survey the damage their main had caused, and to offer relief to the injured. It has been suggested that a Gas Company can afford to view a catastrophe of this kind with indifference. It may charge such a price for its gas as will give a dividend of 10 per cent. If, therefore, it has to pay compensation, it will only raise the price of its gas, and pay the same dividend as before. But we may be sure that this is not the view which in real life those charged with the management of Gas Companies are likely to take. They are not cold-blooded murderers who will be content to kill people merely because their pockets will not suffer for their negligence. Nor would they be allowed to kill them, even if they wished. This accident could only have taken place if there had been a very large main in the streets affected. Gas can be conveyed in small pipes or large, and no mixture of gas and atmospheric air contained in little pipes would heave granite blocks to the tops of houses. The present system of gas-making is to drive vast volumes of gas through large pipes from distant manufactories. This is found to be the most economical system for supplying gas to such a vast population as that of London. But, if the system were recognized as dangerous, it would not be permitted to continue. The Gas Companies would be forced to make their centres of production closer to each other, and to send their gas through smaller pipes. There is no necessary connexion between the use of gas and the possibility of the recurrences of catastrophes of the special kind that has just taken place. The mode of supplying gas might be changed, and then such an accident could not occur. But at present it is much too early to infer that there is any probability of an accident of this kind recurring. No one conceived it possible that it could occur. Now that it is known to be possible, very simple precautions might, it would seem, be taken against its recurrence. It has been discovered by a very painful experience that where nothing but atmospheric air is supposed to be present there may also be gas, if there is any possible connexion between the pipe containing air and another pipe containing gas, although precautions have been taken against this possible connexion being an actual one. The science and ingenuity of engineers must be sadly deficient if means cannot be devised to ascertain the contents of a new large pipe by some safer method than that of applying a flame and seeing what happens. It is very unfortunate that the inhabitants of Tottenham Court Road should have suffered to make the rest of the population of London safer. But a danger that no one thought of has been revealed, and the rest of the metropolis will benefit by the necessity being recognized of guarding against this unknown danger.

M. SIMON AND THE AMNESTY.

M. JULES SIMON had an easy task before him when he rose to convince the French Senate that no adequate arguments had been advanced in behalf of the amnesty voted by the Chamber of Deputies. In point of fact no such arguments exist. There are very good reasons for pardoning repentant criminals, and some for pardoning criminals who are not repentant. There may even be good reasons for granting an amnesty to repentant criminals; but there is nothing whatever to be said in favour of taking the last and largest step of granting an amnesty to criminals who ask nothing better than an opportunity of repeating their crimes. The denial of pardon is undoubtedly open to the objection that it punishes the innocent with the guilty. The wives and mothers of whom M. VICTOR HUGO is the champion in the Senate may plead that the exile of their husbands and sons is in a sense their own exile. But neither wives nor mothers can have any reasonable interest in the restoration of their husbands and sons to civil rights. To have a share in the government of the country, a man ought to wish well to the institutions which he helps to administer. What the Communists think of the institutions of France is perfectly well known. The murders and the fires of May 1871 bear unmistakable testimony on this head, and identical evidence is given every day by journalists who make no pretence of having either learned or forgotten anything in the years that have passed since that time. An amnesty to the Communists is an amnesty to the members of a conspiracy which, though it may be no longer formidable, is still existing. The theory of government which the Commune was designed to embody is held to-day by many thousands of Frenchmen. The means which the Communists took to put their theory in practice are not, and never have been, disowned by them. To restore to them their civil rights is consequently to give a share in the Government to men who are pledged by their antecedents and convictions to overthrow the Government. The argument that an amnesty is really an expression of contempt for those included in it—a kind of contumelious invitation to them to do their worst, and, when it is done, to admit

how worthless that worst is—is a little too refined for ordinary people. If the Government is to be respected, it is not wise to treat admission to a share in it as the last and bitterest insult that can be offered to a defeated rebel. Less subtle observers will read in the plenary amnesty one of two admissions—an admission that in the conflict of 1871 there were faults on both sides; or an admission that the side which then got the worst of it is now strong enough to extort an Act of Indemnity from its adversaries. Neither view seems likely to impress Frenchmen with an increased sense of the stability of their Republic.

M. Jules Simon was also happy in his criticism of the relations of the present Cabinet to the amnesty. He admits of course that when once the country has made up its mind what it wants, and is quite clear that it wants it, it is useless to offer further resistance. But then, he observes, there is a right and a wrong way of making the surrender. The man who has stood out against a proposal in all its stages down to the last is not the right man to take the command in the last stage. His business is to make way for those whose views have got the better of his. There are plenty of Senators and Deputies who could have proposed a plenary amnesty to the Communists without any sacrifice of their convictions. They have been partisans of the amnesty all along, and nothing could be more natural than that they should be the persons chosen to finally grant it. But this is not, according to M. Simon, the position of M. de Freycinet and his colleagues. All that M. Simon can say against the amnesty has been said with equal decision, if less eloquence, by members of the present Cabinet. The distinction between political and non-political offences is of their invention. The plea that rebels who want the power, but not the will, to rebel over and over again are not proper objects of rehabilitating legislation is their plea. If M. de Freycinet thinks that the time has come when resistance to a popular demand is no longer possible, why does he not make way for those by whom the demand has been consistently urged? Of course, as M. Simon very well knows, there are reasons against taking this course which M. de Freycinet may be excused for thinking conclusive. But they are not reasons that can be produced in public, so that M. Simon's challenge was a perfectly safe one. M. de Freycinet must be supposed to have convinced himself that the continuance in office of the present Ministry is indispensable to the welfare of the country. It is indispensable, that is, to the working out of M. Gambetta's policy; and M. de Freycinet has a right to think that in the present position of affairs this and the welfare of the country are exchangeable terms. To make way for the men who have always advocated an amnesty to the Communists would be to hand over the conduct of affairs to M. Gambetta's worst enemies. The main object of conceding the amnesty at the present moment is to prevent the Extreme Left from arriving at power by a dexterous use of the plea that the Government has refused it.

When, however, M. Simon's eloquence has been properly admired, and the theoretical force of his arguments admitted, there remains the question whether he was well advised in advising the Senate as he did. This is not an inquiry to which a reply can be given offhand. It may of course be argued that, if M. Simon is sincere in thinking that an amnesty ought not to be granted, he had no choice but to make the speech he did. This is hardly, however, a statement which has much meaning when applied to so seasoned a politician as M. Simon. He is bound to take some account of the consequences by which the action he advises may be followed, and not to limit his observation to bare abstract considerations. In theory, the Senate is a co-ordinate branch of the French Legislature, and as such it is charged with the duty of allowing no measure to pass of which it does not thoroughly approve. In practice, it is a branch of the Legislature which has yet to make good its position in the State. As such it may be highly inexpedient for it to strain its powers too soon or too far. Hereafter perhaps it may be strong enough to defy its adversaries, and to defeat them on a field chosen by themselves. As yet it is weak enough to make discretion a more valuable quality than valour. The true policy for a young Second Chamber to adopt is to make itself useful before claiming to be indispensable. It should aim at getting a reputation for improving the Bills sent up to it, whether by omissions or additions, in all such ways as do not provoke a conflict with the popular House. By this means the Conservative instincts of the nation may come to regard the Senate as their natural protector, and any proposal for its abolition might then be taken as a signal for serious and sustained resistance. At present there is no evidence that the Senate has made good its claim to this character, or at all events that it is generally held to have done so. It is doubtful whether a proposal to amend the Constitution by limiting the powers of the Second Chamber and giving it at most a sort of suspensive veto would not be considered rather as taking away a possible cause of constitutional strife than as seriously weakening a constitutional safeguard. Now to advise the rejection of the amnesty—and, above all, for M. Jules Simon to advise it—was to run an appreciable risk of seeing some such legislation as this attempted. The part which M. Gambetta had taken in the introduction and discussion of the Bill showed that he at least esteemed it of extraordinary importance, and this fact alone might have shown M. Simon upon how dangerous a path he was inviting the Senate to enter. There are times when a David may meet and slay a Goliath, but there should be a very strong assurance of victory to justify so unequal a conflict. If M. Simon had been in the Chamber of Deputies, things would have been different. To defeat M. Gambetta in the Chamber of Deputies would have been to show that he was weaker than he thought himself. But to defeat him in the Senate may be only to expose the Senate to his attacks, and M. Gambetta's attacks are likely to be more severe than the Senate would find it easy to withstand. Whether the course which the Senate adopted was open to the same objections as a refusal to grant an amnesty at all is another question. The distinction drawn in M. Bozerian's amendment is certainly a sound one, and is not, in terms, inconsistent with the new compromise proposed by the Chamber of Deputies. Unless, however, the Government disclaim the intention attributed to them of pardoning all Communists, whether condemned for common law crimes or not, the acceptance of this compromise by the Senate will be a worse surrender than the acceptance of the Bill in its original form.

PHILANTHROPIC TYRANNY.

THE Government and both Houses of Parliament have lately vied with one another in the cheap asceticism of interfering with the comforts of classes to which no Ministers, no peers, and few members of the House of Commons at present belong. The great majority of Englishmen are in the habit of drinking, for the most part in moderate quantities, beer, wine, or spirits; but only persons below a certain social rank habitually frequent public-houses. The evil consequences of excess have during late years attracted general attention; and a fanatical agitation against the use of fermented liquors has in a great measure superseded rational attempts to check intemperance. The House of Commons, with the approval of several members of the Government, though not of the Cabinet as a whole, has sanctioned Sir Wilfrid Lawson's project of referring to the decision of local majorities the question whether the sale of liquor shall in any parish or district be altogether prohibited. By a second vote the House has determined that public-houses ought to be closed on Sundays, except for the sale during a few hours of beer not to be consumed on the premises. The Welsh members, who mainly represent the Dissenting preachers, almost unanimously supported a proposal that public-houses should in the Principality be altogether closed on Sundays. Several of these measures or resolutions are partly designed to punish the licensed victuallers for their indiscreetly ostentatious support of Conservative candidates at the late election; but the crime for which they are to suffer is not so much political heresy as unexpected electoral weakness. The publicans were quite as active in 1874 as in 1880; but, when they had helped to return a majority, their interests were treated with consideration and deference by Liberals as well as by Conservatives. During the debates on Sir Wilfrid Lawson's Bills and motions in the earlier Sessions of the last Parliament almost every speaker was anxious to guard himself against the suspicion of meditating injustice to the meritorious and powerful body of licensed victuallers.

The Permissive Bill Associations are now thought to control more votes than the publicans, and they command corresponding respect. French or American Protectionists could not be more indifferent than the partisans of local

option or Sunday closing to the wishes and rights of the great body of consumers. The Welsh members, professing to believe that keepers of public-houses would like a Sunday holiday, utterly disregarded the interests of the customers who were to be arbitrarily deprived of the means of refreshment. Mr. GLADSTONE himself, though he is by the Budget imposing a heavy fine on the publicans who were guilty of opposing him at the election, admits the justice of compensation for the possible abolition of their trade. No member thinks of compensating thirsty pedestrians who may be unable on a Sunday to procure a room to rest in or a glass of beer. The House of Lords discussed in the same spirit the expediency of interfering with the tastes and habits of a large portion of the community; and even the apologists for freedom too often accept the theories of their antagonists, while they contend that public opinion is not yet reconciled to extreme measures of prohibition. The pretence that the only reason for meddling is the unpopularity of excessive restriction is a part of the customary tribute which common sense pays to cant. The agitation can be effectually encountered only by challenging its main assumption. It would not be expedient to abolish the sale or consumption of fermented liquors, even if the change could be immediately accomplished without risk of resistance. The customs and ceremonies which promote habits of drinking among the humbler classes of society are probably mischievous, as they are certainly useless; but they will be gradually and voluntarily discontinued, like the similar practices which were universal only a hundred years ago. In the meantime it is not the business of refined and disinterested observers to meddle with the pleasures or happiness of others.

The unopposed adoption of Mr. PEASE's amendment to the motion for closing all public-houses on Sundays might plausibly be supposed to express the opinion of the House of Commons; but members in general are probably content to have redeemed by an inoperative vote the vague and insincere pledges which they may have given at the election. In this, as in several other branches of proposed legislation, they complacently reflect that nothing can be done this year, and that the Government has undertaken to produce a future measure, of which the principle and the machinery have probably not yet been devised. Almost all recent projects have tended to diminish the number of public-houses, with the inconvenience of rendering the existent monopoly closer and more profitable; yet Mr. GLADSTONE and Lord KIMBERLEY have lately expressed doubts whether increased accommodation promotes intemperance; and they have even raised the question whether the trade ought not to be free. The result of the experiment, which was formerly tried at Liverpool, is still a matter of controversy; but the evils resulting from the multiplication of beer-houses seem to show that a discretionary system of licensing is advisable, and, on the whole, no ground for an alteration of existing law and practice has yet been clearly established. The scheme of transferring the sale of liquor to municipal bodies has been definitively abandoned; and if the trade is to be tolerated, it cannot be much further restricted. Local option, or, in other words, permissive legislation, would involve a dereliction of duty by Parliament. The rights of consumers might perhaps be justly disregarded on grounds of general expediency determined by the Legislature; but as long as any proceeding is not condemned by law, it must be considered to be allowable, irrespectively of the opinion or caprice of any local majority of ratepayers. No recent controversy has been so largely affected by insincerity. Almost all disputants affect to assert or admit that it is wrong to drink or to sell liquor, though only extreme enthusiasts propose to abolish the traffic. That the sale and consumption of beer are wholesome, useful, and necessary is a proposition more generally believed than affirmed. It would follow that a practice which is permissible on other days is no necessarily deleterious or criminal on Sundays; but the prejudice which was countenanced by Mr. STEVENSON's motion and Mr. PEASE's amendment will prevail until it is disturbed by a counter agitation. The House of Commons is perhaps scarcely conscious that it has pledged itself to the absurd doctrine that a publican duly licensed to sell beer and spirits should on Sundays be allowed to sell nothing but beer.

If Parliament is unwise enough to humour the meddling propensities of agitating philanthropists, it will probably find itself confronted by a more formidable expression of popular opinion. Sir RICHARD CROSS lately warned the House that it might be difficult to maintain the peace if any attempts were made to close the public-houses of London on Sunday. A proposal of the kind many years ago produced riotous movements which were thought sufficiently formidable to justify the abandonment of the measure. Notwithstanding the alleged popularity of the Sunday Closing Act in Ireland, the large towns have, through considerations of prudence, been exempted from its operation. In England half the population lives in towns, and perhaps a third in large towns. It would be anomalous, if not impossible, to provide separately for the remainder. In the next Session the Government will probably be obliged to confess that their promise of comprehensive legislation cannot be practically redeemed. The present Ministers and their majority may be disposed to try experiments at the cost of landowners and capitalists, but they will shrink from a contest with the lower middle class and with the great body of workmen. If the publicans are well advised, they will keep their own interests in the background, and allow the great community of consumers to represent the cause which is common to vendors and purchasers. Parliament often takes pleasure in annoying single trades and professions, especially those which are weak in numbers. The sufferers can generally be accused of selfishness or of an exclusive regard to their own interests, which in matters of taxation are necessarily opposed to those of the public. It is only when one interest after another is threatened and harassed that the victims of injustice combine, as in 1874, against their oppressors. The Sunday or week-day customers of public-houses are too numerous and too formidable to be safely attacked. They have perhaps hitherto but imperfectly understood the vexatious interference to which they may be exposed; but when they resist, their reclamations will not fail to command attention. The House of Lords will be well advised in not competing with the advocates of schemes of restriction. The Report of the Select Committee of last year has been often mentioned in complimentary language, but it contains no practical remedy for the evil which it denounces. Declamations by Committees or by orators on the objections to drunkenness are useless, although they may be decorous. It is an awkward contrivance to spread a net for the offenders with meshes so small as to catch moderate consumers. The Temperance agitators should be warned that their object is not merely difficult to attain, but that it is bad in itself.

EMPLOYERS' LIABILITY.

MEN are employers or workmen before they are politicians, and the opposition to the Employers' Liability Bill is characterized by a delightful independence of party ties. The proposal to refer the Bill to a Select Committee was defended on Tuesday as though it were the last plank that stood between mine-owners and ruin. The words Employers' Liability are so tremendous that those who are frightened by them are quite unable to draw nice distinctions. But for this, some of the speakers would have seen that what they were really opposing was not the Government Bill, but Mr. MACDONALD's. The notion that a mine-owner is to be liable for the negligence of every man in his mine, though he may not and cannot have had any voice in the hiring of him, or any opportunity of knowing whether he is careful or reckless, is certainly alarming; but it is not a notion which has any place in the Government Bill. It is quite possible that in guarding against any confusion between this proposal and their own the Government may not have chosen precisely the words best calculated to answer the purpose; but the correction of this imperfection does not need a Select Committee. What the House of Commons was really urged to do on Tuesday was to abandon its function of amending a Bill in Committee altogether. If the definition of superintendence and the limit of compensation are matters too high for a Committee of the whole House, the whole life of a Bill between the second and third readings had better be passed upstairs. In the present instance there was a special reason why this course should not be adopted. The proceedings of a Select Committee are necessarily less public than those of the House; and, in the interest of the employers themselves, it is to be desired that any alteration of the Bill should be effected in open day. If it could be said with any show of correctness that the representatives of the employers had contrived to get the Bill into a corner, and had there pulled it to pieces at their

leisure, any gain that the masters might derive from the process would be of very short duration.

More than this, the motive which really justifies the reference of a Bill to a Select Committee is quite wanting in this case. A Select Committee is useful when the principle of a Bill is generally admitted, but there is a great difference of opinion about the provisions by which effect is to be given to the principle. Here, however, the difference goes much deeper. What the opponents of the Bill object to is not this or that mode of defining or enforcing an employer's liability, but the admission that such a liability can fairly or prudently be recognized. Mr. KNOWLES's amendment was avowedly moved with the intention of instructing the Select Committee to consider whether a Workmen's Insurance Bill would not be preferable to an Employers' Liability Bill. It is possible, of course, that it may be so; but the question is not one that can be settled by a Select Committee. It would be as reasonable to ask a Select Committee to say whether an increased beer duty would not be better than the addition of a penny to the Income-tax. The Government has decided to make a certain proposal to Parliament, and Mr. KNOWLES thinks that they ought to have made another proposal instead. That, if he can establish it, may be a sufficient reason for rejecting the Government proposal, and considering Mr. KNOWLES's; but this is not an operation which can be performed by a Select Committee. Indeed the case against referring the Employers' Liability Bill to a Select Committee is even stronger than the case against referring the Budget resolutions to a Select Committee. An increased beer duty and an increased Income-tax are at least alternative proposals. The gap in the revenue might be filled by either expedient, and the choice of one consequently implies the rejection of the other. But liability and insurance are not even alternatives. There is no reason why both should not be adopted. They are directed to different ends, and to ends which are in no sense incompatible. The object of such an Employers' Liability Bill as that now before the House of Commons is to lessen the number of accidents; the object of a Bill to establish compulsory assurance would be to lessen the injuries inflicted by accidents. Underneath the one lies the assumption that, if more care were taken, many accidents which now happen would not happen. Underneath the other lies the assumption that, no matter how much care is taken, a large number of accidents will happen. Mr. KNOWLES says, in effect, to the workman—Here is a plan by which, if you lose your leg, you shall have the doctor's bill paid and be kept from starving afterwards. The workman answers that, if it is all the same to Mr. KNOWLES, he would rather keep his leg; and that, if his master is bound over in a sufficient penalty to take certain precautions, his chance of keeping his leg will be very much greater. The House of Commons may fairly be asked to consider both suggestions; but it will not consider them to much purpose if it regards the one as excluding the other. However important it may be to protect workmen against the consequences of accidents, it is equally important, if it is possible, to protect them against the occurrence of accidents.

The principle on which the Employers' Liability Bill is founded is simple and rational. The employer is to be held liable for accidents caused immediately or mediately by his own negligence. The cases in which the negligence of an employer can be the direct cause of an accident can only occur in very small works. But cases in which the negligence of an employer is the indirect cause of an accident occur in the very largest works. Wherever there is negligence on the part of a person in authority, and this negligence leads to an accident, there is a presumption that the employer's negligence is indirectly to blame for what has taken place. If he had taken more pains about the selection of his subordinates, they would have been more deserving of the trust placed in them. Mr. HUSSEY VIVIAN unintentionally gave proof of the need of making it more to the master's interest to be careful in the choice he makes. "Right or wrong," he said, "a master must uphold his agent, otherwise his influence over his workmen would be destroyed." It does not much matter to the present purpose whether this doctrine is true or not true. If it is true, and the master will, on the whole, do well to uphold his agent "right or wrong," it becomes the more important that the master should be bound over in the most stringent manner possible to exercise due care in appointing an agent. If it is not true, it is equally important that the master shall be brought to see that he must not uphold his agent as a matter of course, and without any inquiry into the facts of the case, and there is no means of doing this more efficacious than holding him responsible for the wrongs done by the agent. It is not enough that a man to whom authority is delegated should be a good servant to his employer. He should also be a good servant as regards the men committed to his charge. It is not enough that his employer when engaging him should insist upon his producing testimony to his excellence in accounts or his ingenuity in invention. These are important considerations, no doubt; but one not less important is, that he should bring testimony to the care which he takes in the discharge of his own duties or in the choice of those to whom he will have to delegate the performance of them. Make the employer understand that he is liable for the acts of those of his workmen whom he has appointed to have the superintendence of others, and he will take very much more trouble in making inquiries before appointing them. Make him understand that, if he delegates to a subordinate the duty of making these appointments, he will still be liable for accidents caused by the negligence of the workmen so chosen, and then he will be very critical of the character and antecedents of that subordinate. There is no way of bringing home this liability to an employer's mind except by fining him for his omission to exercise sufficient care. It is impossible for the man who has been injured by the negligence of a superintendent or other person having authority over him to prove that the employer was careless in the choice he made of that superintendent. The alternative is to make the master's responsibility for any negligence of his superintendent's too clear to be for a moment out of his mind. In aiming at this, the Government have got hold of a sound idea, and to allow of its excision would be to deprive the Bill of the one element which makes it really valuable.

ELEMENTARY EDUCATION IN THE LORDS.

THE House of Lords has twice this week been busy with elementary education. On Monday Lord SPENCER's Bill to make the enforcement of school attendance more general was read a second time. The principal object of this Bill is to give School Attendance Committees the same power of making by-laws that School Boards have. It is found easier to enforce attendance under by-laws than under the provisions of the Act of 1876, and by this Bill this facility will be extended to the whole country. The gradual spread of compulsion has made the contrast between districts subject to by-laws and districts not so subject very patent and very irksome. So long as only a few great towns had by-laws there was little real hardship to parents in the fact that, while their children could not earn money, the children of other parents could earn it. Between a great town and the country outside the industrial rivalry is not great. The town parent saw all the children likely to compete in the labour market with his own children exposed to the same disability, and it did not concern him that beyond the town boundary there were other children who might go to work and no educational authority say them nay. But as School Boards became more numerous, compulsion became more and more common even in country districts, and then the difference between the position of children under by-laws and that of children not under by-laws was brought home to parents in a very practical way. The least that the law can do for a parent whom it has deprived of his children's labour is to set up one and the same measure for all parents in the same position of life. When it is once understood that all over the country children under a specified age are not allowed to go to work, such a prohibition will cease to be felt as a special and exceptional hardship. But so long as this law is binding in one village and not binding in another, the parents who are inconvenienced by it will naturally feel themselves hardly dealt with. Whether the matter is looked at from the parent's point of view or from the child's, the conclusion is the same. If half the parents in England have to forego their children's earnings up to a certain age, why should other parents be more leniently dealt with? If half the children

in England have the benefits of education secured to them by law, why should the interests of the other half be left uncared for? The objection raised by the Duke of SOMERSET did not really touch Lord SPENCER's Bill. It comes to this, that compulsion sometimes bears hardly on parents who have not the means of insuring that their children go to school when they are sent. That is a reason for applying the law with judgment and kindness; but it is not a reason for keeping the application of the law partial instead of making it general. The more universal a law is, the easier it is, on the whole, to secure obedience to it. If the new Bill does nothing to protect the father whose boys go bird's-nesting while he supposes them to be at school, it will at least remove the contrast there is at present between the father who is brought to book for his children's truancy and the father to whom his children's truancy causes no inconvenience. The Duke of SOMERSET must be acquainted with a very exceptional set of magistrates, or he would hardly say that magistrates are inclined to be severe on poor parents in such circumstances. It is impossible that a law compelling the attendance of children at school should be brought into operation without some cases of hardship; but we should have been disposed to say that the action of the magistrates has, as a rule, been lenient rather than severe.

On Tuesday Lord NORTON put a question to the LORD PRESIDENT which reopened to some extent the discussion on the Fourth Schedule. Lord NORTON asked whether almost all the Inspectors of the Education Department had not deprecated grants to elementary schools under the Fourth Schedule. Lord SPENCER's reply betrayed a little of that irritation which is natural in the chief of a department who knows that his own experts are against him. He laid great stress on the word "almost," which had been wanting in the original form of the question, and tried to show that Lord NORTON had exaggerated the opinions even of those Inspectors who had condemned the Fourth Schedule. Upon the first point Lord SPENCER was undoubtedly right. It was an oversight to speak of all the Inspectors. But Lord NORTON would not have been far wrong if, instead of "all the Inspectors," he had said "all the "Inspectors who have had an opportunity of reporting on the "subject." The public appetite for Blue-books might be a little jaded if the reports of all the 126 School Inspectors were every year published. Only a few, therefore, are printed each year, and it will not be till about 1885 that we shall know the opinion of every School Inspector upon this point. Perhaps a return to common sense on the part of school managers, if not on the part of the Education Department, may by that time have rendered their evidence unimportant. So far, however, as we know, all the Inspectors who have reported upon the Fourth Schedule have done so unfavourably. They say that it lowers the quality of the really elementary education given in the school, and that it does not and cannot secure any real progress in secondary education. It is true that this is all they say against it; but, on the whole, this seems to be enough.

Lord SPENCER's correction of Lord NORTON's account of the opinions given by Mr. ARNOLD and Mr. FITCH does not come to much. Mr. ARNOLD, as our readers know, is opposed to the teaching of special subjects in elementary schools, and wishes in place of them to see what the Germans call *Naturkunde*—the simplest explanation, that is, of natural phenomena—and the main facts of English history, taught to every child as part of its regular class-work. Lord SPENCER says, by way of correction, that Mr. ARNOLD thinks that Latin and French have a special claim to be included in the Fourth Schedule. There is no contradiction between these two statements. It is open to Mr. ARNOLD to wish to get rid of the list of special subjects altogether, and yet to hold that, if there must be a list of special subjects, Latin and French have a paramount claim to be included in it. Mr. FITCH's contention, on the other hand, is that, whatever subjects ought to be contained in the Fourth Schedule, foreign languages should not be among them. Exceptional children, he says, should be helped into secondary schools, and so the primary school be no longer tempted to "spoil its own "unity of purpose, and do injustice to the majority of its "scholars, by attempting more ambitious work than it can "hope to do thoroughly well." Lord SPENCER objects that an important qualification has here been left out, because Mr. FITCH goes on to say that the claims of certain other specific subjects are much higher than those of foreign languages. That is true; but why does Mr. FITCH rate them higher? Chiefly because "every one of them is so connected with the rest of the "course that it can be begun and taught in a rudiment-"ary way even in the lowest classes." But subjects taught in this way do not belong to the Fourth Schedule at all. If the LORD PRESIDENT will turn to the Code, he will see that what Mr. FITCH contemplates is provided for by Art. 19, par. C, and not by the Fourth Schedule. A grant depending on the examination of whole classes is a different thing from a grant depending on the examination of particular children. There is no fear that the former will injure either elementary or secondary education. There is fear, and more than fear, that the latter will injure both.

MR. AUBERON HERBERT ON STATE EDUCATION.

MR. AUBERON HERBERT is a thinker in whom the late J. S. Mill would have delighted, had he been still among us. He is a standing proof that the march of modern conventionalism has not yet crushed out all individuality of sentiment or of speech. Only Mr. Herbert seems to us to go even beyond the author of the Essay *On Liberty*. Mill repudiates, as out of the question, the notion "that actions should be as free as opinions," and expressly maintains that a man's individual liberty must be limited by the principle that "he must not make himself a nuisance to other people." We do not say that Mr. Herbert would deny this obvious principle, at least in words, but he seems very much inclined to ignore it. To him individual freedom is not a means but an end, and an end of such paramount and sacred obligation that no risk of practical inconvenience should be suffered to stand in its way. He objects, we believe, to the Contagious Diseases Acts, as an interference with the liberty of the subject, in spite of the strong evidence which has been adduced of their beneficial results, both moral and sanitary. And he has just been inditing a vehement protest against Sir J. Lubbock's Bill for the preservation of Ancient Monuments, based on similar grounds. Of course Mr. Herbert himself has no sympathy with the delinquents in either case; he longs to see them educated up to a higher level of wisdom and virtue. But he would jealously guard alike the sacred right of those who choose to abuse their liberty to sow the seeds of vice and misery untold for generations yet to come, and the sacred right of "modern savages"—the expression is his own—wantonly to destroy, if they are so ill advised, those monuments of the past which are cherished by the civilized world as an "everlasting possession" for future ages. Not that he does not value these monuments himself, or would think the ruins of Rievaulx or Valle Crucis might be advantageously carted away as so much rubbish, or utilized for the construction of a railway station or a barn. He is on the contrary most anxious that they should be carefully preserved, and wishes to see "a widely spread and intelligent sympathy with these old things on the part of the people, and a feeling of responsibility on the part of owners"; but still they had better perish than be preserved by any aid of the law. To invoke such aid is to encourage "excessive idleness," "to relieve us from all the deserved penalties of our carelessness and mental indolence *by depriving us of free action*"; it is a procedure at once reactionary and ultra-Radical, "crypto-communistic" and worthy only of "legislative grandfathers." The truth which lies at the root of all this paradoxical special pleading is plain enough, and will be disputed by no reasonable man. You cannot make people moral by Act of Parliament, and it is far better to promote a high standard of morality than to have to punish crime; prevention is better than cure. But though a thief does not learn habits of honesty, or a drunkard habits of sobriety, by being sent to prison, we are obliged in the interests of society to coerce both thieves and drunkards. It would be far preferable no doubt if interest and information about these ancient monuments were so widely spread that everybody was of one mind in wishing to preserve them; but it does not follow that we are bound meanwhile to show our high appreciation of "voluntary zeal" by suffering any loutish or cantankerous "savage" who happens for the moment to be the owner of one of them to destroy it, if so he wills. Some years ago a distinguished scholar published an unexpurgated translation of the Plays of Aristophanes, putting καθαρὰ τοῖς καθαροῖς as a motto on his title-page, on which the obvious comment was made by his reviewers—How many are "pure," in such sense that this kind of reading will do them no injury? And so, when Mr. Herbert assures us that, "where people can and will give themselves trouble," no valuable relic of the past will be sacrificed, we may fairly ask, How many do care to give themselves this trouble? One might have supposed Roman citizens would be too proud of the Coliseum to endure its being mutilated or destroyed; yet its materials were constantly being carried off for all sorts of domestic or other building purposes till one of the mediæval Popes bethought himself to have it solemnly consecrated and used for religious worship, so that all such depredations might thenceforth be regarded as sacrilegious.

Mr. Herbert is nothing if not chivalrous. If he is ready to run a tilt against Sir J. Lubbock, he is equally ready to challenge the

whole modern system of "State education," and it is fair to admit that in his recent article in the *Fortnightly Review* he is deliberately attacking some favourite articles of the received Liberal, and notably, the Radical, creed. We gather from a footnote that he is indebted for his change of opinion on these points to a study of Mr. Herbert Spencer's writings. A close analogy may be traced, both in principle and in detail, between his line of argument on the Ancient Monuments and on the Education question; but there is much more reasonableness, as will appear presently, in some of his detailed criticisms on the working of the School Board system than in his plea for the impunity of "modern savages." The first objection, which is expounded at considerable length, is that the working-classes are degraded and demoralized by receiving favours; and State education is a political favour paid for out of the forced contributions of the rich, in accepting which "the workman is selling his birthright for a mess of pottage." It is the inevitable and the just consequence of this arrangement that those who pay for the education should claim to direct it, and hence the upper classes—such as parsons, dissenting ministers, merchants, and squires—manage the education of the workman's children, which he ought to manage for himself; that he would be able to pay for it himself is rather assumed than proved. In the next place we have one of the very arguments urged against Sir J. Lubbock's Bill, that to provide education *ab extra* instead of letting parents provide it themselves removes "a great moral and mental stimulus." In this we so far agree, that it is certainly right for parents to pay for the schooling of their children when, and in such measure as, they are able to do so; and it is very possible that this principle is too much lost sight of in School Board administration. There is a great deal of truth in the following passage, which sums up this part of Mr. Herbert's argument:—

I repeat that the great natural duties are the great natural opportunities of improvement for all of us. We can see every day how the wealthy man, who strips himself entirely of the care of his children, and leaves them wholly in the hands of tutors, governesses, and schoolmasters, how little his life is influenced by them, how little he ends by learning from them. Whereas to the man whose thoughts are much occupied with what is best for them, who is busied with the delicate problems which they are ever suggesting to him, they are a constant means of both moral and mental change. I repeat that no man's character, be he rich or poor, can afford the intrusion of a great power like the State between himself and his thoughts for his children. Observe the corresponding effect in another of our great State institutions. The effect of the Poor Law—which undertakes the care in the last resort of the old and helpless—has been to break down to a great extent the family feelings and affections of our people. It is simply and solely on account of this great machine that our people, naturally so generous, recognize much less the duty of providing for an old parent than is the case either in France or Germany. With us, each man unconsciously reasons, "Why should I do that which the State will do for me?" All such institutions possess a philanthropical outside, but inwardly they are full of moral helplessness and selfishness.

It is clearly better that parents should provide for the education of their own children, and children for the support of their aged parents, wherever it is practicable. But does Mr. Herbert mean that children whose parents cannot pay for them should be left in ignorance, and that the aged who are neglected by their children, or have none to help them, should be left to starve? His next objection, from the rigid uniformity of State education and the consequent disinclination to admit new ideas, has again a certain force; but it would apply more or less to any general system. And there is an opposite danger, to which no reference is made, of crotchetiness and instability in methods of teaching; it is possible to be too fond as well as "too shy of new ideas" in such matters. We are more disposed to go with Mr. Herbert in the next count of his indictment, which however is a question of detail, though an important one. He argues that payment by results restricts and vulgarizes our conceptions of education, and reduces it to "one long unbroken grind," and that the rough and clumsy test of annual examinations is fatal to all original talent, whether in the teacher or the taught. Certainly the "modern exaggeration of the use of (competitive) examinations," and the methods of "cram" to which it leads, are serious evils, not at all confined to the education of the lower classes. It may be said just as much of Civil Service examinations as of annual school inspections, that "the State rules a great copy-book, and the nation simply copies what it finds between the lines." The difficulty is to suggest, or at least to carry out, some satisfactory modification of the system. That there are evils, both physical and mental, in a too rigid application of the competitive test, especially in the case of very young children, we quite believe. It is a difficulty concerning our secondary as well as our primary schools, and one well worthy of grave consideration. But we cannot enter on its discussion here.

It is creditable to Mr. Herbert's impartiality, as we have already indicated, that he does not hesitate to arraign the cherished dogmas of the extreme political school to which he belongs whenever they cut across his argument. He is no less scrupulous in his desire to hold an even balance in the educational controversy between Church and Dissent, though we may presume that his sympathies incline to the latter side. The unfair use which Nonconformists are apt and are often able to make of the existing system is pointed out plainly enough in the following incisive passage:—

But everywhere Nonconformists are being drawn into supporting the present school system, into obtaining popular influence by means of it, and, what is most inconsistent and undesirable, into using it as an instrument for spreading their own religious teaching. It is rapidly becoming their established Church, and it will have, we may safely predict, the same narrowing effect upon their mind, it *will beget the same inability to perceive the injustice of a political advantage, which the national Church has had upon its supporters.* Such a result is matter for much regret. First, because there is already but little steady adherence to principle in politics; and where a large body of influential men put themselves in a position which is inconsistent with the application of their own principles there is a sensible national deterioration. Secondly, if school boards are to be instruments of authoritatively teaching subjects of common dispute amongst us, such as the inspiration of the Bible and the performance of miracles, the struggle between the supporters of revealed religion and the different schools of free-thought must be embittered. It is the question of political advantage and disadvantage which fans these disputes into red heat.

His own remedy is not secular education, which he considers "at best a miserable expedient," but that each religious body should undertake the education of its own children. It would no doubt be a relief to the consciences and the pockets of many religious people, especially parochial clergymen, who have now to pay the School board with one hand and their own voluntary school with the other, if some arrangement like that prevailing in Canada could be effected, by which every one has the option of giving his school rate to a denominational or a government school as he pleases. But that would not satisfy Mr. Herbert, who objects not only to a uniform system of State Education, but to all State aid of education. The original error was not the creation of the present School Board system, but "the unwise, if well intentioned, assistance of Government" to voluntary efforts. The two, we are told, can never go on side by side, and if voluntary effort is to succeed, Government must leave it to itself. We should first get rid of compulsion, and then get rid of all dependence on the central department. But, putting aside the question of compulsion, which stands on somewhat different ground, the old difficulty in dispensing with legislative aid in the preservation of ancient monuments confronts us in another form. "Could education be supplied without official assistance?"—that is, of course, to the community generally. Mr. Herbert replies without hesitation "that it could." But his conviction is based more on *à priori* grounds than on experience. That "education did not spread quicker in the earlier part of the century" is accounted for mainly by the fact that Government unwisely stepped in and thus checked voluntary effort. But what is there to show that unassisted voluntary effort would have been equal, or anything like equal, to the emergency? The question has often been asked how far, in the event of disestablishment, voluntary zeal would suffice to provide religious ministrations in country districts, and the need for such ministrations would be more keenly realized by the giving classes than the need for education. There is something very graceful in Mr. Herbert's implicit faith in the generous instincts and growing culture of the great body of the people, but also something slightly Quixotic. "A little life and light" may be "worth getting at almost any price," but we are not so sure as he is that the result always will be to "make us wish for more," when wishing for more involves also paying for it.

THE IRELAND OF FICTION.

ALL things please the soul, according to the statement of an optimist poet, made perhaps a little in haste. Whether the Compensation for Disturbance (Ireland) Bill comes within this sweeping assertion is a question which an Irish landlord, or a believer in the old-fashioned ideas of justice and fair play, or a guileless person who thought Mr. Gladstone and his friends meant what they said in 1870, may have some difficulty in answering in the affirmative. Nevertheless there have been times at which even this remarkable measure, in its progress through an enlightened House of Commons, has given pleasure to the soul. For instance, it might well have inspired some one to say, "Come, Muse, let's sing of Hats." The attention of Mr. Gladstone and Mr. Forster is earnestly called to the fact that this is a terrible season for the customers of Messrs. Lincoln and Bennett. It is the bright day that brings forth the new hat, and then the rain comes down and spoils it. This being the case, it is certain that the arrears of many persons to the establishment at the corner of Sackville Street must weigh heavily on them. Why should it not be enacted that to every one who cannot pay Messrs. Lincoln and Bennett's bill, those eminent artists should make compensation not exceeding seven hats? Again, there was a time in the discussion when the position of the County Court judge was referred to, and it must be a dull mind that cannot conjure up a pleasing picture of that. We don't envy the County Court judge who is stingy with his compensation. He will have to be, as they say in France, *blindé*, which means, not blinded as a minister of justice, but armour-clad in coats proof against rifle and revolver. There will be rest for the agent, and rest (though no rent) for the landlord, while the boys are running playfully after the County Court judge's car or stalking him from behind a hedge. So that, at any rate, the junior Bar of the sister isle may look forward to plenty of places (with "pinsions," as the Molony observed); and they cannot be so dead to the national tastes as to object to the bullets which, having given them that promotion, will perhaps subsequently endeavour to send them even further aloft. Yet again, when Mr. Gladstone and Mr. Forster drew that pathetic picture of the abhorrence with which they regarded their duty of seeing the law carried out by armies of process-servers and constabulary, how pleasant was it to look forward to the 1st of January, 1882! Then, according to present understanding, and leaving Mr. Parnell out of the reckoning, such Irish landlords as are

not in the meanwhile starved or bankrupt will recover the right of getting their own. There will be something like an army needed then. Even the division list itself had its peculiar attractions. It was pleasant to see the three friends Mr. Gladstone, Mr. Bradlaugh, and Mr. Samuel Morley united in the same good work. No man of true humour (and all the three persons just mentioned are nothing if not humorists) could help laughing heartily at the notion of an English landlord, a distinguished professional man, and a British merchant generously voting bonuses to Larry and Dennis out of the pockets of Colonel King-Harman and Lord Ardilaun. But, on the whole, these minor beauties of the night paled before the great geographical discovery which an attentive study of the whole debate unfolded before the eyes of the student. We have all heard of the Ireland of fiction, and some of us have regretted the cheerful country where claret, and beer, and whisky induced a perpetual state of hilarity, where every man was genially ready to break the bread—and the head—of a friend, where the population consisted of delightfully named societies of "Blazers" and "Rakes of Mallow," and so forth, and where, if there was little money, there was apparently an astonishing amount of mirth. This country of romance has long ago disappeared. But the other night there appeared—drawn in outline by Mr. Forster, vigorously filled in by the Irish Attorney-General, coloured in a masterly manner by Mr. Gladstone, and varnished to a nicety by Lord Hartington—the map of a new Ireland of fiction, less picturesque perhaps, but even more surprisingly different than the old one from the actual distressful country which lies beyond St. George's Channel. So fresh and novel was the picture that any but very careful hearers or readers might have suspected themselves to have gone to sleep in the midst of a debate about Ireland, and to have awaked in the midst of a debate about Utopia, till the actual recurrence of the weary word corrected their misapprehension.

The Ireland of fiction, as is natural, differs most strikingly from the Ireland of fact in a negative manner. In this new country, of which the new Four Masters just mentioned have given us a picture, the unpleasant features and facts of the old are delightfully absent. Obscure hints were indeed made concerning (as his Majesty King James I. would have said) a "kind of evil beast called agitator," which even in the Ireland of fiction works some woe. But, as we shall see shortly, the agitator is not the principal pest of the country, as he certainly is in the Ireland of fact. In the Ireland of fiction no grey-headed peer of the realm (whose only crime was that of expending vast sums to buy back his own property of which the law had deprived him) lay not much more than a year ago murdered by wretches who were successfully protected by the whole countryside. In the Ireland of fiction today there is no such thing as a land agent at the point of death owing to the arguments of recalcitrant tenants. No grand juror in that happy country was fined in this very week for not attending a court which he could only have attended at the risk of his life. The peaceful denizens of fictitious Ireland never run after their landlords with pitchforks and compel them to defend themselves as they might against bushrangers,—but we beg pardon of the Australian Mr. Kelly and his friends, who are usually content with simple robbery, and do not, unless constrained, mix murder with robbery. In the Ireland of fiction the amiable sons of the soil do not torture and mutilate cattle because their owners obey the law and pay their debts. In that happy realm there is neither bludgeon nor vitriol bottle, and agricultural implements are used only against the *justissima tellus*. It was not in this land of injured innocence that an eloquent gentleman last Sunday talked of "vermin against whom there was no close time," and suggested the immediate pursuit of this variety of game or not-game. Of all these things none of the Four Masters (Mr. Forster, Mr. Law, Mr. Gladstone, and the Marquess of Hartington) gives the least hint. On the contrary, the Ireland of fiction is inhabited by an orderly and upright population, whose one abiding principle and motive of action is a burning desire to pay their rents. Mr. Law and Lord Hartington are quite sure of this, whatever else they may be in doubt about. The Irishman of fiction, they would probably allow, is not quite faultless; but, in the matter of rent-paying, say the Marquess and the Attorney-General, he is absolutely impeccable. Another peculiarity of the Irishman of fiction is that nothing but the possession of a small piece of land is wanted to make him perfectly happy and prosperous. He will not (like his most dissimilar double, the Irishman of fact) endeavour to make twenty people subsist where there is room for ten, nor decline absolutely to betake himself to any profitable employment other than pottering about his land, nor waste his substance in good years and tumble heedlessly into the usurer's hand during bad. On the contrary, if he can get some money out of his landlord, Mr. Forster is quite sure that he will emigrate at once and reduce the population to a proper level. He is thus a compound of amiability, moral uprightness, and keen appreciation of the truths of political economy. But he is subject to two frightful pests. The agitator, as we have already mentioned, is one of these; but of him the Four Masters say little. The real curse of the Ireland of fiction is the landlord. This demon is distinguished from the Irish landlord of fact by quite as many negative and positive distinctions as their respective tenants. He never, like more than one Irish landlord of fact, spends on his estate more money than he would get out of it even if his rents were paid. He never, like many another, supports the peasantry bodily and by a dead lift of unfaltering charity, through the trouble which their own hopeless improvidence brings upon them. His income is never drained by charges for which he himself is not responsible. On the contrary, he spends his time in devising how he shall bring most misery on his tenant. He "enforces his pound of flesh, and adds farm to farm, in order to grow sheep instead of men"; he has made "monstrous, prolonged, inveterate efforts" to do something dreadful, though indefinite, to the Irishman of fiction. He sets "armies of agents and constabulary" to work, not apparently for the purpose of recovering the money which is his due, and which he very likely owes to somebody else, but purely for the delight of harassing and worrying. No wonder that the Four Masters pity the Irishman of fiction vexed by this tremendous bogy. Indeed the fictitious tenant is, according to one of them, in a plight which is truly terrible. For he is "deprived by the act of God of the means of payment, and liable to the confiscation of that estate with which the Act of 1870 provided him." Such are Mr. Gladstone's own words, and we can only admire the delicacy with which the contrast is drawn between Ormuzd and Ahriman. The Act of Mr. Gladstone provides the Irishman of fiction with an estate, the act of the Deity deprives him of it. Who can hesitate between the two Powers so modestly brought into comparison?

In striving to identify, for the assistance of geographical students, this remarkable isle of persecuted saints with the actual island which England has for her sins to help and to bear with, we have succeeded in lighting on one very valuable feature common to the two. The Ireland of fact returns a considerable number of members to the Parliament of Great Britain, and so does the Ireland of fiction. Rather more than half these members are of a turbulent disposition in both cases. Nay, more; from the dim allusion to agitators which, as we have observed, the speeches of the Four Masters contain, we are inclined to think that in both Irelands, that of fiction and that of fact, there is a city called Cork and a member for it. Now, if by any means it should be possible to propitiate the Mr. Parnell who sits for the more shadowy constituency through the presentation of large bonuses to his clients and the mulcting his enemies of the same, it seems not improbable that the Mr. Parnell of fact might be a good deal less troublesome to the Four Masters and their friends. As a matter of fact, we observed, if we mistake not, considerable assistance lent by the latter person to the Government in a matter which they had much at heart—the seating of Mr. Bradlaugh. Gif-gaf is perhaps not a proverb of the Ireland of fiction in so many words; but it is believed that Mr. Parnell is a sufficiently acute person to understand the principle it propounds. We know that Mr. Gladstone has already repudiated the idea with scorn, and of course it never could have occurred to him. For it is perhaps rather a discreditable idea, and, as Mr. Borlase knows, it is absolutely impossible that the present Prime Minister could do or think anything discreditable. Again, some hints in the debate might lead one to suppose that the Government, finding themselves incompetent to govern the real Ireland, have resorted to the pleasing fiction of creating a new one out of their own heads. But between these and other explanations we do not attempt to decide. We are, after all, only humble geographers, engaged, like the draughtsmen of Messrs. Black or Messrs. Keith Johnston, in constructing from the scattered hints of our authorities a map of a hitherto unknown country, that it may be added to the political atlas.

DIFFICULTIES OF DINNER-GIVING.

HOWEVER modest people's opinions may be of their own capabilities, there are certain things, such as driving a gig, editing a newspaper, or managing a theatre, for which almost all men consider themselves admirably fitted. Among the many functions which every one thinks he could perform with success is that of dinner-giving; but in reality it is one of those apparently easy matters which are extremely difficult.

It is proverbial that ladies who happen to have unusually extensive wardrobes are fond of complaining that they have nothing to wear; and much on the same principle, when those who have a large circle of acquaintance wish to make up a dinner party to meet some persons whom it is their duty to entertain, they declare that they know nobody to ask to meet them. The happy thought in such cases often suggests itself, "Let us first invite the Lothburys, and if they refuse, we shall be saved all further trouble." If the party is not strangled in its birth by the refusal of the honoured guests, the cares and sorrows of the entertainment at once begin. "Who shall we ask?" is a question which is then constantly reiterated. The hospitable dinner-givers hold a little court, and try all their acquaintances in turn, administering justice without mercy to each name as it occurs to their memories. These people the hostess "really could not do with"; those are dull; some are "not at all the sort of people that the Lothburys would like to meet"; and others are "in quite a different set." The excellent Lothburys are not intellectual enough to get on with one eligible couple, nor are they quite fashionable enough to appreciate the "society small talk" of another, even if they were to go through a month's cramming in the handbook on the subject lately written by "a Member of the Aristocracy." It is not worth asking the Smiths to a dinner at which the best champagne is to be used, and Baron von Ratandmouski is miserable unless he can smoke in the dining-room after dinner, whereas Lord Lothbury abhors

tobacco. The Cornhills would do very well, "but," the hostess ruefully says, "they owe us." The Glendowers would be all that could be wished; but Lady Glendower's rank would necessitate her being taken into dinner by her host, although she is a person of far less importance than Lady Lothbury, and it is desirable that the latter should be the most honoured guest of the evening. The FitzCharleses would be exactly the people wanted; but two of their children have got the measles. At last, after much brain-racking, a more or less eligible list is made out, and the invitations are issued. There is no apparent reason for more than twenty-four hours' delay in an answer to a letter in London; but when invitations are sent out for a dinner party replies are frequently very slow in forthcoming. If the truth were known, many people wait before answering an invitation to see whether a better one may not turn up, in which case they rarely scruple to answer the first by expressing their sorrow that "a previous engagement prevents their accepting" it. It often happens that through refusals, many of which have been unwarrantably delayed, a third of the party has still to be made up within a few days of the banquet. The highways and hedges have now to be ransacked. The hostess orders her brougham at eleven in the morning, and hurries off to press into her service one or two intimates who will stand short notice; and the host is sent to his club "to get a man." It is far from impossible that, on the very morning of the event, the Lothburys, for whom the party has been got up, may themselves fail, through the sudden illness of Lord Lothbury's mother; and the hospitable dinner-givers, to their chagrin, are obliged to go with all speed to a couple of poor relations and beseech them to come and sit at their table.

It often happens that on the very day of the party, the favourite greengrocer fails, and then there is a scramble to get another. Instead of the tall and well-mannered under-butler of a nobleman out of town, a shambling being who looks like a cheap undertaker's mute has to be put up with. Many other difficulties sometimes present themselves. A friend of ours once took a house for the season, with a large dining-room, and rather hurriedly arranged a party of eighteen for dinner. On the morning of the entertainment the butler found that there were only sufficient extra leaves for the table to make it long enough to accommodate fourteen people. There was nothing for it but to jump into a hansom, drive to an upholsterer's, and hire a proper-sized table, which eventually only arrived just in time to be prepared for dinner. We have known a much more tragic event happen in connexion with a dinner-table. There was to be a large yet select party, and what novelists call "the hospitable board" was all ready for the feast. Everything had been laid with exquisite taste and ungrudging expenditure, under the very eye of the hostess herself. Within a few minutes of the time appointed for the banquet, a servant was lighting up the room, when he leaned rather heavily on the table in order to light the candles which stood upon the grand centre piece. The table literally groaned, and not content with groaning, it crashed. Down went everything on to the floor, and in a moment there lay in the middle of the dining-room a confused heap of candles, broken glass, crushed fruit, stained table cloth, broken Dresden china, disjointed candelabra, and bruised flowers. On the top of all sprawled the servant, at full length, struggling to free himself from the bewildering débris.

As a general rule, we believe that an approaching dinner party is more agreeable to the hostess than to the host. To a woman there is something pleasant in the fuss which precedes her entertainments. She is mistress of the occasion, and her orders are implicitly obeyed. With a man it is different. What amuses his wife fidgets him. He is restless and uneasy. When he goes to his study for a quiet hour before dressing, he finds it has been taken possession of by his wife's maid, and converted into a temporary ladies' cloak-room. On the very altar stone of his sanctum, right in the centre of his writing-table, stands a looking-glass. His precious handbooks and dictionaries, his papers, notebooks, and Acts of Parliament, are profanely piled in a corner of the room. Finding his study desecrated, he wanders about the house, a burden both to himself and to others. He is in a fidget because his wife has not yet returned from her drive, and he fears she may be late for dressing. He is himself dressed far too soon, and finds nothing to do in the drawing-room, which is all prepared in state for the reception of guests. He employs himself in opening and shutting windows, regulating lamps, and very possibly upsetting a flower vase. As the party arrives he begins to talk with each person, but he is too preoccupied with the grouping of his couples for dinner to be able to give his mind to any continuous conversation. Somebody has not arrived, and he keeps nervously looking at his watch. When all have come, he shyly walks from one man to another with a piece of crumpled paper in his hand, at which he casts sheepish glances, and tells them in a mysterious whisper whom they are to take in to dinner, with the air of a man who is doing something of which he is ashamed. This arrangement of the guests at the dinner-table has been the cause of great anxiety to him for days. He has thought it over in bed, in hansoms, and in church; he has found it more difficult than a game of chess, and even more provoking than Boss. Arrived in the dining-room, instead of quietly directing his guests to their alloted seats, he orders them to their places like a sergeant-major, and after making an apologetic grace, he sits down.

Once seated at the table, there is not much left for the host and hostess to do. They may try to attract the attention of the butler and ask him to open the windows wider; but, if things go badly, all they can do is to look on grimly. It might often be well if hosts and hostesses were to endeavour to make themselves more agreeable at their own tables; but, as a rule, people are pleasanter companions in the houses of others than in their own. At their own entertainments they are apt to be too much preoccupied to be able to give their whole minds to any subject which may be mooted. They are fretting because the soup is cold, or because an *entrée* is overflavoured; they are in agonies at a long pause which occurs between the courses; they are observing that a couple at the other end of the table are not talking to each other; or they perceive that the best judge of wine at the table is drinking light claret, instead of the best champagne which has been produced for his special gratification. We lately saw a hostess much perturbed in spirit. She had provided the best of meats and drinks; but some of the guests failed to do justice to them. One gentleman had taken up total abstinence; and, instead of enjoying the excellent wines, he lectured upon the subject of his favourite hobby. It happened to be a Friday; and two of the other guests, who were Roman Catholics, touched neither soup, entrées, joints, nor jellys, to the great sorrow of their hostess, who did not perceive that they made capital dinners on fish, vegetables, sweets, and wine.

A serious, and let us hope exceptional, difficulty in dinner-giving is a drunken butler. We remember a host looking anything but pleased when his inebriate domestic poured a trayful of cups filled with tea into a lady's lap in the drawing-room. Not long ago a gentleman told his new butler that he had better open a certain number of bottles of wine before a dinner-party, and that, when they were finished, he must use his discretion. Long after the gentlemen had left the dining-room, there were no signs of tea in the drawing-room; the host, therefore, went quietly downstairs to hurry the butler. He found that functionary in the ante-room engaged in gulping down champagne out of a tumbler. "What are you doing?" said the master. "The wine you ordered was all finished, so I am using my discretion," answered the man. It is needless to say that much of the success of a dinner party depends upon the efficiency and skill of the butler—more, we are inclined to think, than most people imagine. If a butler cannot always make a party go off well, he can always spoil it. The cook, of course, is the main agent in dinner-giving. We divide cooks into two classes—those who cook carefully but moderately well every day, but cannot cook artistically when there is a party, and those whose cooking is all that can be wished on any special occasion, but careless when the master and mistress are alone. Many people think the former the best sort of cooks; but, on the whole there is much to be said for the latter, because the misery of seeing a bad dinner put before friends in one's own house is so great that some shortcomings in one's everyday dinners are not to be compared to it. There are few occasions on which a man feels at once so helpless and yet so responsible as when he sits at his own table watching a bad dinner being given to his guests. Perhaps the *entrées* are stodgy, the roasts under or overdone, and the sweets rolling about, instead of standing in their dishes; an even temperature is maintained in everything; the soups, the meats, the jellies, and the puddings are all pretty equally lukewarm. And yet the unfortunate giver of the feast, utterly helpless and inwardly boiling over with wrath, has to make himself agreeable and converse brilliantly on general topics, as if he had not a care in the world. The next morning the hostess proceeds to relieve her feelings in the housekeeper's room. With an air of injured innocence, the poor cook weeps over the fate of her excellent dinner. Everything, she says, had been cooked to perfection, but the butler and footmen kept the whole dinner waiting, and dishes which were fit to put before a king were allowed to get sodden, tepid, and spoiled in the serving-room. The hostess goes to her husband, and tells him that "he really must speak" to the butler on the subject; but, before he has time to do so, the butler comes himself to complain. He had sent down again and again to the kitchen for the courses, and yet he was kept waiting. The sauces were not sent up with the things, and one man had to be employed during the greater part of dinner in running with messages to the cook. He had sometimes begun to think that she must have gone to sleep. The general result of the affair in such a case is likely to be a grand row among the domestics, with which we gladly dismiss the subject.

MR. HYNDMAN ON THE EXHAUSTION OF INDIA.

MR. HYNDMAN has secured a well-defined place in contemporary Anglo-Indian literature. He is master of what may be called the hysterical method of treating Indian subjects. In an evil hour for the chances of common sense and reasonable discussion, it was revealed to him that the indifference or repugnance of English magazine-readers to Eastern subjects could be best overcome by a series of sensational effects. The vast size of India, the imposing aggregates that have in every instance to be dealt with, the remoteness of some topics, the obscurity of others, made it easy to be sensationally effective. Thenceforward Mr. Hyndman's performances have been little more than a series of shrieks, each more piercing than the last. The crimes of the Government, the fatuous imbecility of Indian statesmen, the desolating effects of a rapacious administration, the exhaustion of the soil, the increase of famine mortality, furnished him, each in turn, with material for rhetorical outbursts of protest, lamentation, and invective. It

was little to the purpose that again and again his figures were contradicted and his conclusions disproved. Mr. Hyndman remained unconvinced and unconvinceable. If he kept silence for a few months, he presently revenged himself by a wilder outburst than ever. He was convinced of "the bankruptcy of India," and it was in vain to endeavour to upset this conviction by mere arithmetical demonstration. He was certain that the Deccan ryot was of all men most miserable, and it was useless for apologists like Sir Richard Temple to show, by a calm statement of unquestioned facts, that even in this—probably the poorest part of India—there were satisfactory proofs of a steady growth of national prosperity. Three years of famine—the longest and most widespread of the century—naturally intensified Mr. Hyndman's gloomy views, and supplied still deeper colours for his grim delineations of a beggared exchequer and a ruined people. The incomprehensible circumstance that the country rallied from this exceptional disaster with unprecedented rapidity, and that the treasury of a poverty-stricken Empire was found to be overflowing, failed, as every other argument had failed, to shake his belief in himself and his theory. The blunder in the Afghan war estimate has naturally brought him again upon the scene, with a dirge duly attuned to the desperate character of the situation. India, it appears, is being ruined by "over-Europeanization and economical error"; "famines are more frequent, more fatal"; "taxation has reached its limit; the revenue is inelastic; the expenditure is steadily increasing; the production of the soil over large areas is lessening; the margin of food above the limit of starvation is being greatly reduced." Nor are these the only signs of the ill results of British rule; the very circumstance that two hundred and fifty millions of people are kept in order by sixty thousand European troops, and governed by a few hundred European civilians, shows how deep the national depression must be. In Bombay and Madras alike outlawed leaders have recently appealed for help to the oppressed population, but in neither case have met with the slightest sympathy; here is another dreadful result of misgovernment. But this is not all. In the native States Mr. Hyndman finds models of simple, inexpensive, effective government and prosperous populations, which he contrasts with "the vast bureaucratic machine" of English rule and the impoverished wretches who groan under its exactions. He indicates no less than nine points in which the native system shows a marked superiority over its British counterpart. Meanwhile "the productive powers of the soil are calculated to have decreased at least thirty per cent. at least in thirty years"; "twenty millions' worth of agricultural produce leaves the country without any direct return"; "the one great need of India is capital, and that capital we now drain away"; "even as we look on, India is becoming feebler and feebler. . . . The very life-blood of the great multitude under our rule is slowly, but ever faster, ebbing away"; "and yet," cries Mr. Hyndman in despair at the apathy of his audience, "we are still content to discuss."

Discussion of a rhapsody such as this would be of course misplaced; but when such performances are allowed to find a place among the contributions of reasonable beings, it may be worth while to expose a few of the gross blunders and misrepresentations on which the whole structure of ignorance, folly, and conceit is reared. There is scarcely a single statement in the whole of Mr. Hyndman's essay which may not be met with a categorical contradiction. It is, in the first place, absolutely untrue that India is bankrupt, or anything like it. During the last decade she has had a surplus of revenue over normal expenditure of more than 25 millions, or an average annual surplus of 2½ millions; the result of which has been that in that period, besides spending 14½ millions in the relief of famine, and remitting 3 millions of revenue, and notwithstanding a loss of more than 14 millions by exchange, she has still been able to contribute from her ordinary resources 7½ millions towards the expenses of the Afghan war. It is, again, absolutely untrue that the sums invested in irrigation and railways have been unproductive. The results may be found by any one who wishes to verify them for himself in the appendix to the financial statement contained in the recent Blue-book on the Afghan war estimate. There it will be seen that the 20½ millions invested in irrigation will earn in the current year no less than 1,211,000*l.* net profits, or very nearly 6 per cent., notwithstanding the fact that at least 4 millions of the whole are locked up in unfinished works. The State railways—many of them unfinished, and all undeveloped—will earn a net profit of 596,000*l.* on a capital of 31 millions. The guaranteed lines will earn a net profit of 5¾ millions on their capital of 96½ millions. On the other hand, the crops, saved in 1877 by the canals, were in several instances worth the entire capital outlay on the works; and the two millions of tons of food which the railways carried into the famine-stricken districts must have saved at least twelve million lives. No project could more fully have realized the expectations of its authors or be more full of promise alike for the Government and the people.

It is not true, again, that famines are more frequent and fatal than formerly. The famine of 1876-1878 was, no doubt, one of quite exceptional severity, unequalled probably since the great disaster of 1770; but it is certain that many millions were kept alive who must have perished but for the organized measures of relief and the vast railway imports of food. Every fresh mile of railroad and canal diminishes the likelihood of mortality on future occasions. Nor, again, is it true that taxation has reached its limits, for the richer classes are still practically untaxed; in this very year the Government abandoned the impost which it had been settled that they ought to bear, and within the last two years nearly a million sterling of taxation has been surrendered. Every branch of revenue, except where the course of fiscal reform has involved abandonment of income, shows satisfactory elasticity and steady increase from the development of the country.

The land revenue of Madras, for instance, is double what it was twenty-five years ago, though its incidence is infinitely lighter. Nowhere in India is it more than 7½ per cent. of the gross produce, and in several provinces it is less than 5 per cent. Salt, owing to Sir John Strachey's admirable reforms and to railway development, was never so cheap and never so largely consumed. On the other hand, Mr. Hyndman will be surprised to learn that the cost of administration is being steadily retrenched, that every branch of the service has been scrutinized in search of possible economies, and that in the present year half a million has been curtailed from the expenses of a single department. As to the deterioration of the soil within thirty years, the only germ of truth in the statement is that, in some places, the profits of irrigation have tempted the cultivators to take too heavy and too frequent crops off their lands; and that, in others, the increase of population has led to the cultivation of inferior soils. Lastly, as to the excess of exports over imports—in other words, the cash which India has to remit to Europe—a moment's reflection will show that this is money paid for money's worth. Five millions of the sixteen which India annually remits are the interest of the guaranteed lines; but that five millions represents eleven millions gross earnings paid in the country by thirty-four millions of passengers, who found their profit in travelling, and by the owners of nine or ten millions of tons of goods, moved about for the purposes of commerce. Two and a half millions more are interest on the public debt, the whole increase of which has, since the Mutiny, been expended in remunerative engineering projects of the highest utility. The rest may be regarded as the price of that most excellent bargain under which it results that two hundred millions of British subjects live on in unbroken peace and yearly increasing prosperity, under a Government which hardly costs them more than many an Eastern ruler has squandered on parasites and seraglios. "The one great want of India," says Mr. Hyndman, "is capital." It is so, and the supply of that capital from England, on mutually advantageous terms, is one of the innumerable blessings which India has reaped and is reaping from the connexion of the two countries.

It is useless to pursue any further the analysis of a mere tissue of arrogant, passionate, and reckless blunders. Mr. Hyndman will no doubt continue to the end, "delivering brawling judgments all day long," on subjects about which he knows just little enough to theorize and declaim, but which have been to wise, earnest, and thoughtful men the study of a lifetime and the aim of a career. Every part of the administration which he so glibly denounces has been thought over, written about, and practically tested by the experience of skilled observers. It has no doubt many shortcomings, and is liable, as the last few weeks have proved, to serious miscarriage; it is exposed to great dangers; it involves enormous difficulties; but they are difficulties and dangers which require for their treatment the intellect of philosophers and the genius of statesmen, not the irresponsible babble of ignorant and careless pamphleteers. The process by which the two hundred millions of India are passing from a disorganized horde of agricultural peasants into a great, opulent, and civilized Empire is, and must assuredly be, gradual and arduous, checked by repeated obstacles, marred by repeated failures. But it is too bad that it should be the pastime of ephemeral literature and the pet topic for picturesque extravagance. Whether the English nation will succeed in carrying through without disaster its great mission of Eastern Empire is a problem on which it would be rash to speculate; but, if it does, success will be owing to the patient and unpretentious labour, the wide knowledge, the conscientious zeal, the ripe experience, the political skill, which have been and are devoted to the task; and to the habit, still happily characteristic of Englishmen, of turning a deaf ear to the noisy interpellations of ignorant and undisciplined enthusiasm.

THE TAY BRIDGE DISASTER.

THE view which was formed very shortly after the occurrence of this lamentable catastrophe is entirely confirmed in the elaborate reports which Colonel Yolland, Mr. Barlow, and Mr. Rothery have made to the Board of Trade. The bridge failed because it had not sufficient strength to resist the lateral pressure of the wind. This great defect, of which the result was so terrible, was due, in the opinion of Mr. Rothery, to incompetence and carelessness on the part of those who constructed the bridge, which merit grave censure. His colleagues apparently share his views; but they content themselves with stating the facts of the case, and leave the authorities and the public to draw their own inferences. We shall deal principally with their Report, as it contains an excellent description of the structure, and states in a very clear and succinct manner the nature of the defects which caused it to be so lamentably wanting in strength.

From this carefully considered Report it appears that one of the most important features of the first plan of the bridge was altered in constructing it. "The bridge as originally designed," say the authors of the Report, "had piers of brickwork and spans of 200 ft. of clear water space in that portion of it which forms the

subject of this inquiry; but, in consequence of difficulties with the foundations, Sir T. Bouch altered the spans to 245 ft., excepting two, which were made 227 ft.; and he also altered the piers from brickwork to ironwork above high-water level, in order to lessen the weight on the foundations, and to obtain the best distribution of weight and material which the circumstances permitted." How great an alteration this was, and how much it weakened the structure in some respects, are only too obvious; and, without relying on the knowledge obtained by subsequent facts, it certainly seems strange that Sir Thomas Bouch—the engineer of the bridge, as we need hardly say—should have thought it advisable to sacrifice so much strength. Apparently, however, he had thoroughly convinced himself that no harm would come, as he stated in a letter (quoted in the Report) that the change had been the subject of long and careful consideration; and it does not appear that he was doing anything of which other eminent engineers would have disapproved. After this departure from the original plan had been determined on, the work was put in hand, and the slender structure rose so rapidly that only two years and a half after Sir T. Bouch had decided to use iron instead of stone, it was ready for inspection by the officers of the Board of Trade. The quick completion is not surprising when the manner in which the bridge was put together is considered. Colonel Yolland and Mr. Barlow give the following account of it:—

The spans of the bridge varied from 245 feet to 29 feet. The piers were 85 in number, of which the first 14 were of brick, the remainder being formed above high-water level of tiers of cast-iron columns bolted together vertically by bolts and nuts, and connected together laterally by means of cross bracing and struts of wrought iron. The number of columns in position on each pier varied from three to six. Those under the largest spans were formed of six columns, bolted to base pieces, which were bedded in stone. The lower portions of these piers consisted of concrete, brickwork, and masonry, their construction being accomplished by means of iron caissons which were left in forming part of the permanent work. Commencing from an abutment on the south shore, the bridge curved for the first three spans to the left until it came at right angles to the course of the river, which here runs nearly due east and west; it was then straight to pier 53, whence it curved sharply off to the right with a radius of 20 to 22 chains, until it finally reached the north shore. . . . The high girders extended over 13 spans, namely, 11 of 245 feet each, and two of 227 feet each, making a total of 3,149 feet. This portion was divided into three sections or groups, the first, counting from the south, contained five spans of 245 feet each; the second, of four spans, two of 245 and two of 227 feet each; and the third, of four spans, all of 245 feet each.

In February 1878 the bridge was ready for use, and was inspected by General Hutchinson for the Board of Trade. He put it to what was undoubtedly a very severe test in one respect. In order to try its power of resisting a vertical strain he "caused six locomotives coupled together, each weighing seventy-three tons, to pass over the bridge at a speed of forty miles an hour." More or less satisfied with this and other tests, he reported in a somewhat ambiguous manner to the Board of Trade that he saw no reason why the Board should object to the bridge being used for passenger traffic; adding, however, that trains should not cross it at a higher rate of speed than twenty-five miles an hour, and stating that he should wish, if possible, to have an opportunity of "observing the effects of a high wind when a train of carriages is running over it." He had clearly an inkling of possible danger, but apparently was oppressed by no very grave misgivings. Neither the Board of Trade nor the Company paid any attention to his "wish," and the capacity of the bridge for resisting wind-pressure was not observed by him or by any other qualified engineer. On the strength of his report the official permission was duly given; and, after some delay in completing the approaches, trains began to run in June 1878—that is, a year and a half before the accident. As might perhaps have been expected, General Hutchinson's recommendation respecting speed was disregarded, and the pace of twenty-five miles an hour was exceeded. A short time after the way had been opened for traffic, defects in the structure began to show themselves. In October 1878 Mr. Noble, an inspector of the Company, found that there was a "loosening of a number of the ties of the cross-bracing" of the columns. He put them to rights as best he could, and did not inform Sir T. Bouch of what he had discovered. The authors of the Report consider Mr. Noble an intelligent man, very competent in the class of work to which he was accustomed, but not qualified for such work as the inspection of this bridge. In October 1879 the same inspector found that four of the columns were cracked, and that there were other signs of injury to the bridge. He reported them to Sir T. Bouch, who ordered the defective parts to be strengthened in a manner which he thought sufficient, and seems to have felt no uneasiness respecting the structure. Very shortly afterwards the terrible disaster came. In this state "of the columns and ties," says the Report, "the storm of the 28th of December, 1879, occurred, which would necessarily produce great tension on the ties, varying as the heavy gusts bore upon different parts of the bridge; and when under these strains the train came on to the viaduct bringing a larger surface of wind-pressure to bear as well as increased weight on the piers, and accompanied by the jarring action due to its motion along the rails, the final catastrophe occurred."

Respecting the cause of it, Colonel Yolland and Mr. Barlow appear to entertain no doubt whatever. In a decisive summing up of their conclusions they say that in their opinion there is nothing to indicate any movement in the foundations; that the wrought iron and cast iron used, though not so good as they might have been, were fairly good; that the girders which have fallen were of sufficient strength; but that the iron piers used in place of the brick piers originally contemplated, though strong enough for supporting the vertical weight, were not sufficiently substantial to sustain at so great a height girders of such magnitude as those which fell; that the cross-bracing and its fastenings were too weak to resist the lateral action of heavy gales of wind; and that the fall of the bridge was occasioned by the insufficiency of the cross-bracing and its fastenings to sustain the force of the gale on December 28, 1879, the bridge having been previously strained by other gales. Sir T. Bouch, in his evidence before the Court of Inquiry, stated that in his opinion the accident was caused by a carriage and van being overturned and canted against the girder so as to destroy portions of it and thereby occasion the fall; but this view Colonel Yolland and Mr. Barlow unhesitatingly, we might almost say contemptuously, reject; and it is scarcely possible for any one who reads their Report to doubt that they are justified in this, and that they assign the true cause for the accident. As was thought from the first, the pressure of the violent wind against the great girders and the train was more than the tall and slender groups of columns, insufficiently braced together, had strength to withstand, and the bridge and train were blown into the water.

This insufficiency of strength was due to two causes—bad design and bad workmanship. When the columns and ties were being made at the foundry, there was not a proper supervision of the work, and in consequence there were grave defects in it. It is not necessary to quote the very technical description which Colonel Yolland and Mr. Barlow give of the cross-bracing of the piers, as it is enough to say that the fastenings of the heads and bases of the tiers of columns, and of the ties which held the columns together, were insufficient, being badly planned and badly executed, and that in consequence before the accident many of them had become loose. Apart from the state of the fastenings, the cross-bracing was insufficient, so that the structure was altogether unfit to resist a great lateral strain. Alike in the design, construction, and maintenance of the bridge, danger from wind-pressure was disregarded.

Why was it that more attention was not given to the possibility of the whole fabric being blown down? Why was not provision made against a terrible accident which certainly does not enter into the category of those fatalities which cannot be foreseen? At first the answer seems simple enough. The engineer who designed the bridge should certainly have taken the wind-pressure into consideration and not have allowed the defective work. That in this latter respect he was to blame can scarcely be disputed. Sir T. Bouch and his staff should not have passed much of the work which was thought good enough for the Tay Bridge. Whether he is to blame for not allowing sufficiently for the wind-pressure is, however, a different question. A man can hardly be blamed for not being better than the best of his brethren, and it seems very doubtful whether, at the time when the bridge was built, any English engineers paid much attention to the possible pressure of the wind when calculating the stability of their structures. Colonel Yolland and Mr. Barlow do not blame Sir T. Bouch for neglect on this head; but then they do not consider it part of their duty to censure any one, and they have apparently authorized Mr. Rothery, who does censure very severely, to say that they agree with him; so that their judgment must be held to be altogether against the engineer. So far as he considered wind-pressure at all, he relied, it seems, on a Report of Messrs. Barlow and Pole, based on a statement of the Astronomer-Royal, which altogether misled him; but it must be said that the language of those authorities was highly calculated to mislead. In order, however, to determine how far he is to blame, it is necessary to consider briefly the question raised in Mr. Rothery's Report, as that learned gentleman has separated himself from his colleagues partly because he thinks that he is bound to deal with the question of responsibility, which the others do not consider themselves entitled to decide.

This question Mr. Rothery does decide in a very emphatic manner. He condemns the Railway Company, the contractors for the bridge, Sir T. Bouch, and to some extent the Board of Trade. That there is reason for much of his censure can hardly be denied; and when he holds Sir T. Bouch responsible for the defects in the construction of the bridge, his decision seems scarcely open to question. It is somewhat different, however, when he holds him responsible for the faults in design—that is, for what subsequent knowledge has shown to have been faults in the design. Undoubtedly, as has just been shown, there was not sufficient allowance for wind-pressure; but then it does not appear to be the practice of English engineers to make much allowance for wind-pressure. Even now the best authorities differ largely as to what this pressure may amount to; and one engineer of great experience, who has devoted special attention to the subject, said, when giving evidence before Mr. Rothery and his colleagues, that in his opinion the pressure over one span of the high girders of the Tay Bridge could hardly have exceeded 15 lbs. per square foot. Others stated that it might be 40 lbs. or 50 lbs. per square foot. As has been said, the Report which Sir T. Bouch had to study was highly calculated to mislead, and altogether it appears that there is not much definite knowledge on the subject now, and that there was still less at the time when he designed the Tay Bridge. He followed the practice of English engineers, and did not trouble himself greatly about wind-pressure. Mr. Rothery holds that he is to be severely blamed for this, because he might have ascertained that engineers in France and the United States allowed for a wind-pressure of 50 lbs. and 55 lbs. per square foot; but here it is diffi-

cult to agree with the Commissioner. A man can hardly be censured because his knowledge does not exceed that of the most skilful men in his own profession. A doctor who lost a patient's life through ignorance of methods which are followed in Paris and Berlin, but are unknown at the College of Physicians, would not be thought to deserve blame. In this case surely censure must fall not so much on Sir T. Bouch individually as on the engineering profession. Engineers have neglected a most important branch of inquiry, and in their calculations have frequently ignored one material item. Departing in some cases from the old system which gave a wide margin of strength, and contenting themselves with a much smaller margin, they have forgotten to take into account a danger which threatens the comparatively weak fabrics that are now raised, and have not given sufficient heed to what has been done in America and France. In this as in other matters, knowledge in England has not kept pace with the knowledge attained in other countries. The conclusion is an unpleasant one, and may cause grave doubts as to the safety of existing structures; but it is a conclusion which can hardly be avoided, and it will not be made more acceptable by blaming an individual for negligence which seems to have been general in the profession to which he belonged.

THE MILITARY MUDDLE.

IF in the fulness of time, or possibly a little sooner, the British taxpayer comes to regard his army which costs some fifteen millions annually as an unmitigated nuisance, if not an altogether hopeless case, the fact will hardly be surprising. For the last twenty years the army has in truth been a source of chronic embarrassment, difficulty, and certain expense for uncertain results. No sooner is one burning military question disposed of than another relieves guard with fearful and monotonous regularity. We appear, in fact, to manage our military machine on the principle of the dishonest watchmaker who, while repairing one part of a watch, took care to disarrange another in such a way that it was safe to find its way back to him for fresh repairs before very long. For instance, we abolished the sale and purchase of officers' commissions, and then discovered that we had supplied a hitherto contented and zealous body of public servants with a solid, substantial, and serious grievance in the shape of hopelessly congested promotion and consequent loss of professional prospects. At last we are compelled to substitute a costly system of bonuses and pensions to do that which had previously been done by the officers themselves. Partly from a desire to relieve an existing block in the promotion of the Royal Artillery, and partly from a tardy recognition of the responsibility and importance attaching to the command of a battery, we promote at one sweep the whole of the first captains in that corps to majorities, and then find that we have virtually superseded a large number of cavalry and infantry officers who, on the principle of better late than never, are even now demanding corresponding promotion. Or a sudden frenzy for localization seizes us; we spend between three and four millions on new barracks wherewith to gratify our whim; and having thus at length provided our regiments with a local habitation and a name, we awaken to the unpleasant fact that they have little else to boast of, for we cannot in any moment of emergency fill their ranks from their proper localities, and other corps have to be denuded as occasion requires. Moreover, the new system does not lend itself to the peculiar demands of foreign service, and the roster has not even yet recovered from the dislocation caused by its introduction. Again, we plunge headlong into short service, and after giving it a fair trial we find that an old soldier is better than a young one; that the system is utterly unsuited to our army; and, having seriously lowered the standard of discipline and impaired the efficiency of our troops, we are now trying to retrace our steps.

How is it, we would ask, that our army requires such incessant legislation, and that every attempted reform turns out a failure? We can manage and administer our navy, if not to perfection, at all events pretty much to our own satisfaction and to the admiration of foreigners, who are never tired of extolling our system and endeavouring to imitate it. Is our success in this direction due to the *quieta non movere* policy—to the fact that we never attempt to alter that which has served and still serves us well? Certainly, purchase never existed in the navy; but still we might have tried some experiments in localization, such as manning given squadrons exclusively from a given port; or we might have recurred to the old and long-established system of short service for the blue-jacket; but fortunately for ourselves we did none of these things. How much better would it have been had we never attempted them with our army! There can be no doubt that the latter service has suffered from excessive legislation by incompetent legislators, while the former has been left comparatively undisturbed. The reason for this is probably to be found in the different circumstances of the two professions. The soldier is always with us and in our midst, not merely personally when at home, but also through the medium of newspapers and correspondents when abroad, and most of all when on active service. The Volunteer movement has not merely deprived the military profession of the exclusive character it once possessed, but has inundated the country with amateurs who think themselves perfectly qualified to judge, criticize, condemn, and reform everything connected with their professional brethren. On the other hand, we see very little of the sailor. A small part of his service is spent at seaport towns and a large part at sea, where we neither see him nor hear of him. While the special military correspondent is a recognized institution, and one too of daily increasing importance, the special naval correspondent has as yet no existence. Military manœuvres, drill, and words of command are common property, while naval evolutions, tactics, and technicalities are a sealed book to the great mass of the people; and we cannot refrain from adding, Long may this state of things continue! Our journals pour forth whole columns of description, suggestion, and criticism on the army, many of them, as we recently showed, evincing utter ignorance of the subject in all its bearings, while they are far more reticent on the subject of the navy, for the simple reason that, while writers and readers alike possess just that little military knowledge which is dangerous, neither writers nor readers have any knowledge at all of naval affairs. In like manner, in Parliament the number of members in both Houses who speak in a military debate is legion, while a naval debate is practically confined to a few experts, the utterances of the amateur critics attracting no attention from the House or the public.

Still all this will hardly account for the comparative efficiency of one service and the shortcomings of the other. An opinion has recently arisen, and is slowly and surely gaining ground, that the system under which our army is managed is radically faulty, and requires change. The recent speech of Sir Garnet Wolseley at the dinner of the Newspaper Press Fund, if read between the lines, is a distinct indictment of the present military administration, and, however much opinions may differ as to the propriety of such utterances on the part of an officer in his position, there can be little doubt that he spoke the sentiments of many both in and out of the service. Let us resume our comparison with the navy. It is managed, as every one knows, by a Board composed of four members, of whom the First Lord only is a civilian. Associated with him are three naval Lords, who advise on all purely technical and professional matters. Thus the Board of Admiralty forms a compact and homogeneous body, having no separate individuality which can be assailed, and, as a consequence, enjoying perfect freedom from attacks of a merely personal nature; while, at the same time, its decisions rarely fail to carry weight and to command respect. We wonder how many of the outside public even know the names of the three naval Lords of the Admiralty. Probably very few; and it is this very want of personality which is the strong point of the system in the present day. Our military system is almost exactly the opposite of this. The army is controlled and commanded by two persons, who, instead of being associated, are too frequently the reverse. In place of combined and harmonious working, we too often have friction, if not actual discord and divergence. This is only human nature, and we are far from wishing to attach any blame to either; it is the system which is in fault, not the men. But the weak point is that both the Secretary of State for War and the Commander-in-Chief stand alone and isolated in their respective departments of financial and technical administration. The result is natural. No important measure is sanctioned, no reform announced, for which one or the other is not held directly and personally responsible. Instantly a perfect deluge of criticism, approval, praise, censure, or vituperation is let loose, which, instead of being directed against a combined body of men who can share the burden, falls upon one individual. Nor is this all. The First Lord of the Admiralty and the Secretary of State for War change with every Government, while the naval Lords of the Admiralty are frequently changed during a single Administration. The Commander-in-Chief alone is a fixture, and no change of Government brings him the smallest respite from the isolation, the responsibility, and the criticism which are the accompaniments of the post he has held for a quarter of a century. The consequence is that, when any important military question arises, a Royal Commission is resorted to as the best means for providing advice and dividing the responsibility which is thus tacitly admitted to be too great for any one man. And what is a Royal Commission? It consists of a body of men whose official connexion with the question at issue begins when they assemble and ends when they disperse. Before the ink of their signatures is well dry their names are forgotten, and the very frequency with which these Commissions have of late years been employed has completely robbed their opinions of the weight which ought to attach to them. For instance, where is the result of Lord Airey's Commission on our recruiting difficulties, which assembled a year ago? It has never even been published, and rumour says that it never will be published in its entirety, because some of its recommendations are unpalatable in a financial point of view. Then why was it ever appointed? We should like to know how many Royal Commissions have been summoned on military affairs, and how many on naval affairs, during the past twenty years. The answer would be a conclusive argument in support of our views. Our system of military administration is a blot and a scandal, and one that must produce disastrous consequences if persevered in. Meantime our army goes from bad to worse. Our regiments are skeletons in points of numbers, their ranks are filled with untrained boys, we cannot get enough recruits, and the reputation of the service in general is waning with fearful rapidity. The contrast between the line as it now is and the well-filled ranks and fine men of the Militia, who have lately completed their annual training, was simply painful. The case appears to be almost hopeless, for no Government will face it, but

each leaves it for its successor to deal with. More extraordinary than all, the nation never grudges money for military purposes, and yet, while our army is proportionately by far the most expensive in the world, we have little to show for it. This cannot go on for ever.

FLOGGING MISSIONARIES.

THE sovereign authority which missionaries are said to claim over uncivilized tribes, the missionary right to try, condemn, torture, flog, imprison, and starve, are very serious matters. Almost all our recent "little wars" have sprung, more or less directly, from the enterprise of missionaries. The Abyssinian affair was caused by missionaries. Missionaries spread the reports about Cetewayo's cruelty and contempt of the Sabbath day, which at least hastened the perhaps inevitable encounter with the Zulus. A missionary complicated the relations of the late Government with the Porte, and missionaries have interfered pretty freely with the domestic Royal quarrels which keep Burmah in hot water. Mr. Stanley's expedition, no doubt, was a journalistic, not a religious one. He converted a casual king or two by the way, but his real end was to increase the circulation of the *Daily Telegraph* and the *New York Herald*. If he shot negroes in so noble a cause, it would scarcely be fair to credit missionaries with his victories over naked enemies. On the other hand, the Rev. Brown's raid on New Britain was a very pretty bit of amateur warfare. Mr. Brown had a certain amount of excuse. His brother missionaries had actually been eaten by the New British. The doctrines which it is Mr. Brown's business to preach do not encourage retaliation; but it is plain that missionaries, being human, must occasionally rebel against the old cannibal practical joke.

The proceedings of the Blantyre missionaries of the Church of Scotland have been a good deal discussed in the House of Commons and in the press. It is possible that many people who are interested in the wild justice of the Aberdonian evangelists have not read the pamphlet in which Mr. Chirnside, F.R.G.S., first brought the affair to the notice of the public. We therefore propose to examine Mr. Chirnside's account of the perpetual warfare, the brutal punishments, and the mediæval system of torture by aid of which certain Scotch missionaries are said by him to have alienated a friendly, and to have disturbed a comparatively peaceful, people. It will be found that all the evidence on which Mr. Chirnside's stories are founded is not of equal value. At the same time we intend to examine the remarkable defence of "these good fellows," the missionaries, which Mr. Waller has published in the *Times* of last Thursday.

The Blantyre mission was founded as a result of the following events. In 1859 Dr. Livingstone was among the Makololo tribe, some distance above the Victoria Falls of the Zambesi. When he left the tribe, some twenty of its members accompanied him as far as the Shiré valley. Most of these men were not pure-blooded Makololo (or Makalolo; Mr. Chirnside spells the name in both ways), and they did not greatly care to return to a land where they were held of small account. They therefore settled in the Shiré valley, among men of broken clans; a timid people, whose rude organization had been destroyed by the slave-trade. These "broken men" gathered round Livingstone's companions, who formed a nucleus of some attractive power. As a result, each of Livingstone's men became a great chief, and built a "town," like the frog in the Zulu fairy-tale. The whole affair illustrates early history; and Chipitula, the strongest chief, in his "town" on the Shiré, is much in the position that Romulus, according to the legend, occupied on the Tiber. Chipitula, in his "asylum," has a force powerful enough to keep the river against Portuguese and Arab slave-traders. He is frightfully cruel; but men like him enable a collection of human waifs to grow into a tribe, perhaps into a nation.

How do these reorganized tribes regard the English? In 1867 they met Mr. Young (who was looking for Livingstone) with the cry, "Our fathers, the English, have come back." Englishmen might well be proud of this recognition. To have enabled a horde of cowering wretches to grow into a settled people, safe within their own borders, is to have served humanity. But the Blantyre missionaries, if Mr. Chirnside is to be believed, have changed all that. In 1874, after Livingstone's death, the Free Kirk sent a mission to Lake Nyassa, and the Auld Kirk, not to be left behind, sent out the Blantyre missionaries. Mr. Young led the Free Kirk "Livingstonia" Mission. As he and his companions ascended the Shiré, Chipitula sent in presents of ebony, sheep, goats, milk, and eggs. Mr. Young found among the grateful natives "a hearty welcome and a host of willing allies." Now, we are told, things are altered. Mr. Chirnside declares that the natives would "hardly do a stroke of work for any white man" when he left the country. The Chief Ramakukan, the natural protector of the Blantyre Mission, was withdrawing his subjects, though Ramakukan had been the most eager friend of the English (or Scotch) at their first arrival. When Mr. Young came, 800 natives carried his stores over sixty miles of country, and at the end "delivered everything up to us unmolested, untampered with, and unhurt, every man merry and content with his well-earned wages." Thus Mr. Young launched the Livingstonia, the Free Kirk Mission, "a genuine success from first to last," says Mr. Chirnside, who may be a United Presbyterian for aught we know.

We are told, however, that all the pleasant idyllic industry of the Shiré river tribes is changed into warlike discontent since the arrival of the missionaries of the Auld Kirk. The storm broke when the missionaries shot a man for a crime of which, says Mr. Chirnside, he was not proved to be guilty. "The first charge which I have to bring against the Mission is that, not having the power of life and death in their hands, in executing a native for an alleged murder they exceeded their duty, and took up a most improper position. Furthermore, I firmly believe, in common with others, that the unfortunate man never committed the crime (in the idea of *white* people a crime) of which he was accused." Murder is a crime, or at all events a strong measure, in the eyes even of most black people. But here is Mr. Chirnside's version of the affair. A woman served two masters, both of whom worked for the Blantyre Mission. She left them, the missionaries (very properly) protected her, and the men threatened vengeance. Some time afterwards another woman was found shot beside the river. The missionaries set the two masters of the first woman to make stocks, clapped them in the stocks, and accused them of the murder. "In spite of the weak evidence, *if there was any*—for no one at the Mission could ever say what evidence there was when asked—both men were sentenced to be shot the following morning." One escaped; the other—so says Mr. Chirnside—was butchered with circumstances of atrocious and revolting cruelty, which we prefer not to publish.

What is the evidence for all this? Mr. Chirnside only says:—"The scenes that have occurred at Blantyre can be attested on oath by more than one eye-witness, and in point of fact those stationed there to spread 'the glad tidings' never attempted the slightest denial when questioned on the subject by the writer of this pamphlet." Thus it seems that Mr. Chirnside visited the Blantyre Mission after the event described, and his story rests on second-hand evidence. But he has one bit of actual testimony which we give in his own words. He has seen, it appears, the Blantyre gaol:—

> At the back of the blacksmith's shop a pit has been sunk in the ground, the bottom of which is reached by a movable ladder. In one of the sides of this pit a hole has been dug which will just contain a man, and it is fitted with a strong door which cannot be forced. On top a pyramid of stones is piled to prevent any one trying to dig the prisoner out through the roof of this place. This is the Blantyre prison, and men are confined in it for three and four days at a stretch, and during that time they receive neither food nor water, nor do they see daylight for any duty of nature. We were told that "they are generally quiet when we take them out again," which means that the strong men they put in come out perfectly dazed and silly.

Mr. Chirnside adds that the natives pass the night in trying to set fire to the roofs of the Mission-houses, while the Presbyterian patrols "go about all night long armed with loaded Sniders"; so that, on the whole, the religion of peace seems rather in difficulties at Blantyre. The people to be pitied are the Free Kirk missionaries at Livingstonia. Their supplies come through Blantyre, and the surrounding heathen, not detecting the immense theological differences between the Free Kirk and the Auld Kirk, are beginning to plunder the convoys, and to attack the Livingstonia natives, when the latter go down to Blantyre. We do not intend to quote Mr. Chirnside's revolting story of how the missionaries had a man flogged to death to make him confess what had become of a packet of tea. Mr. Chirnside speaks as if he had seen the whip employed by the agents (Bismarck, Ropa, and Aramasa, aided by a white) of the missionaries. "A formidable weapon it looks, as it lies before me, with three thongs of buffalo hide." The man who was flogged, so Mr. Chirnside says, was an invalid. Perhaps if he had been in health a matter of over two hundred lashes might not have killed him. Mr. Chirnside says "the story was told us," which is not evidence. But he observes, as if of his own knowledge, "flogging with this whip is an every day occurrence, three lads in one day getting upwards of a hundred lashes." Mr. Chirnside also accuses the missionaries of hunting out refugees for Chipitula, who, though apparently an unconverted character, tortures them to death, neither more nor less than if they were supposed to have stolen a parcel of tea. These things "happened the last day I was at Blantyre."

The reader must judge for himself as to the value of the story of the flogging, and the anecdote about the shooting. It is not denied, as we understand, that both punishments were actually inflicted. The existence of the prison, and the perpetual state of war in a country once friendly, seem to us tolerably sufficient proofs that the Blantyre Mission has not been wisely or fortunately managed. Meanwhile, Mr. Waller writes from Twywell Rectory to the *Times* to defend the missionaries. Mr. Waller says he has himself "confronted most of the embarrassments which have fallen upon the Blantyre missionaries." He cannot mean of course that he has confronted the embarrassment of being obliged to starve black men in an *oubliette*, with a pyramid of stones on the top thereof. As to the other embarrassments, the flogging, shooting, giving up refugees, the idea that Mr. Waller has confronted them is out of the question. He goes on to give "the reason these good fellows went to Blantyre"; and an excellent reason it is. The good fellows went "to operate against the peculiar abominations connected with the slave trade." Are *oubliettes* among these abominations, or did the good fellows introduce the "pit with a hole in the side, which will just contain a man"? We really do not know. The reason of the good fellows, then, was "a fixed determination to operate against the peculiar abominations of the slave-trade of Central Africa, in a manner

which is denied to the influences acting upon the coast and upon the high seas of Africa." Of course you cannot dig a pit in the high seas of Africa, wherever they may be, and so far the Blantyre people have an advantage over the other influences. "It is no resolution of to-day," Mr. Waller goes on, "that the trade in human beings must be sapped at its foundations by civilization and Christianity, and not left only to cruisers." But, on Mr. Chirnside's showing, civilization and Christianity are rather neglected at Blantyre. Mr. Chirnside speaks, as we have seen, of chiefs of some influence in the neighbourhood of Blantyre. Mr. Waller says, "There is no chief worthy of the name among them." Here is a conflict of evidence. In the absence of chiefs, Mr. Waller argues, quoting Mr. J. Campbell, that the natives, or rather that circumstances, forced territorial jurisdiction on the missionaries. Circumstances cannot give a missionary, however Scotch, the old Scotch baronial right of pit and gallows. But Mr. Waller does not see this. "It is useless to say that, before all things, an Act of Parliament should now be rummaged out to see what can and what cannot be done. . . You feel an Englishman," and so forth. Not even a quotation from *Pinafore* can justify an Englishman in shooting, flogging, and starving people who, if Mr. Chirnside is right, do not need these kind attentions. Mr. Waller claims for the missionary a right not to bother about rubbishy Acts of Parliament, because he is the only help and stay of "poor waifs" in danger of being kidnapped. But, even if Mr. Waller's extraordinary claims followed from his premisses, Mr. Chirnside denies the premisses. As we read him, the Shiré river people were happy enough and moderately safe under their own rulers before Mr. Waller's "Scotch gentlemen, with earnest artisans of the stuff Aberdeen turns out," came into their country. Mr. Waller goes on to talk of Mr. Chirnside's "laughable errors," of which he does not give one single example. He then sneers at "a Piccadilly publisher." And this stuff makes the staple of his defence of the Scotch gentlemen and earnest artisans. One thing is clear, that, if earnest Scotch working-men cannot go to a missionary station without assuming the right to imprison and starve the natives, it would be better for the working-men just to bide cannily at Aberdeen. As for the natives, they would be rather more comfortable under the rule of Chipitula. We do not credit all the details of Mr. Chirnside's stories. The tales, in particular, of the flogging and of the shooting are very loosely given. But about the pit, and the whip, and the refugees whom the missionaries gave up—though Mr. Waller says they are there to protect refugees—we have at least Mr. Chirnside's own word. We have also, in Mr. Waller's letter, a measure of the claims of missionaries—claims which, if granted, may stain the repute of our country, and at any moment land her in a war with savages.

FRENCH MERCHANT SHIPPING.

THE French Chamber has just passed a Bill for the rehabilitation of the mercantile marine of France which has spread alarm amongst our own shipowners, and has been the subject of several questions in the House of Commons. We venture to think that the alarm is quite groundless. The Bill will hurt most those whom it is intended to serve. It is the result of an agitation which has been actively kept up since the war, and possibly even longer. One of the most remarkable and hopeful phenomena of our time is the patient, persistent, immovable determination with which the French people have set about repairing their disasters of ten years ago; though unfortunately, as in the case before us, their exertions have not always been intelligently directed. They have not been content to compete with their victors in ever-growing armaments; they have also laboured to develop the material resources of their country, and with so much success that, in spite of enhanced taxation, *phylloxera*, silk failures, and bad harvests, they have borne an expenditure about fifty per cent. higher than before the war, and yet have augmented their trade, and probably likewise increased their savings. In studying the weak points of their national position, it was impossible but that they should be struck by the decaying condition of their mercantile marine. France has often contended against ourselves for the military command of the ocean, but she has never seriously disputed our superiority as sailors and traders. It is likely, therefore, that she would have acquiesced in our constantly growing pre-eminence as inevitable if we alone were leaving her behind in the race. But when she compared the extraordinary expansion of the merchant navies of the Scandinavian countries with her own stationary condition; above all, when she contrasted the advance of Germany as a naval Power with her own decline, it was natural that public opinion should be strongly moved. With the single exception of Austria-Hungary, Germany has the shortest seacoast of any country in Europe. It is swept by terrible storms during a great part of the year, and it contains barely two good harbours. On the other hand, France has an immense coast-line. In the Channel alone she has as many harbours as Germany and Belgium together; and, in addition, she has the vast stretch of the Atlantic seaboard, besides the Mediterranean coast. Yet the progress of the German mercantile marine has been so rapid during the last quarter of a century, while the French has declined, that the German tonnage actually now exceeds the French. It is true that the French steam tonnage is superior, and consequently that in efficiency her mercantile marine stands before the German. But the popular mind does not take note of nice distinctions. It sees only the broad fact that, as in arms, in literature, and in research, so also upon the sea, German energy and German enterprise stand out prominent, and not unnaturally it is mortified and alarmed. Nor is it reassured when, setting comparisons aside, it turns to examine the actual condition of the mercantile marine. While only sixth in absolute number and tonnage of ships among the maritime countries of the world, France is second or third in the number of wrecks. Thus in 1876, according to statistics quoted last year in the French Chamber of Deputies by M. Georges Périn, and not contradicted, England lost 447 sailing-vessels, and France, coming immediately after her, lost 176. The following year England lost 559; the United States, coming second, lost 200; and France, coming third, lost 172. It will be seen how much scope there is for a French Plimsoll. In fact, as M. Périn boldly stated, the explanation of the decay of the French mercantile marine is that French shipowners persist in keeping worn-out vessels so long afloat that they go to the bottom in greater numbers than the more numerous German, Swedish, and Norwegian ships, and in as large numbers as even the American.

What are the causes of this highly unsatisfactory state of things? They are very numerous, but some of them are clear enough. The French people do not take naturally to the sea. At former periods of their history, indeed, they have shown a marked aptitude for colonization, and for the leadership of less civilized races. During a great part of last century it seemed very doubtful whether the possession of the North American continent would fall to England or to France. From the mouth of the St. Lawrence to the mouth of the Mississippi French settlements hemmed in our own colonies. And to this day, while the French element is important in Canada, the names of St. Louis, New Orleans, Louisiana, and a host of others bear testimony to the impress left by French enterprise upon the Valley of the Mississippi. So, again, in India it was for a time doubtful whether the genius of Clive or of Lally would prevail. But on the sea France has never been pre-eminent or likely to become so. And in recent years the establishment of peasant proprietorship, the limitation of families, the general comfort of the population, and the system of education, by strengthening the stay-at-home propensity of the people, have intensified their distaste for a seafaring life. The abstention from emigration, the want of colonies, and the comparative smallness of French trade, have likewise contributed to the same result. So also, for some years after the war, did the high interest yielded by the public funds, when a capitalist could get 6 or 7 per cent. for his money without risk or trouble. But the effect of these combined influences may easily be exaggerated. It is quite possible that what are thought to be the most ingrained tendencies of a race may be overcome, and at any rate the profitableness of investment in Rentes soon came to an end. The really potent cause of the decline of the French marine was the revolution which naval architecture has undergone. England, owing to her unrivalled advantages in the possession of coal and iron, in capital, plant, and mechanical skill, led the way in this revolution, and the speed with which she increased her steam fleet enabled her to monopolize a large part of the French carrying trade. Possibly English shipowners found the French carrying trade more lucrative than the German, and made more effort in consequence to secure it. Possibly also French capitalists found full employment for their capital in developing other resources of their country, and in lending to poorer countries; while Norway and Sweden, and to a less extent Germany, were driven to the sea in order to make up for the niggardliness of their native soil. However this may be, it is certain that the proportion of the French carrying trade conducted in foreign bottoms is very large. According to statistics collected by the Chamber of Commerce of Marseilles, 71 per cent. of the total entries into and clearances from French ports in 1875 consisted of foreign vessels, 12 per cent. were French vessels subventioned by the Government, and only 17 per cent. unsubventioned. And when once English shipowners had established themselves in the carrying trade, it was difficult to drive them out of it. The speed with which steam displaced sails, and iron was substituted for wood, tended to bring about a glut of shipping, more particularly when the long depression of trade set in, and thus French shipowners were discouraged from taking the steps which alone could enable them to compete with their English rivals.

If we are right in these views, it is very certain that the Bill which has just been carried through the Chamber of Deputies will have little influence upon the competition. It proposes to encourage shipbuilding by giving premiums amounting to 60 francs, or 2*l*. 8*s*., per ton for iron and steel ships; 20 francs, or 16*s*., per ton for wooden vessels of 200 tons and over; 40 francs, or 1*l*. 12*s*., for composite vessels; and 12 francs for auxiliary machinery. In addition it offers to vessels engaged upon long voyages premiums amounting to a franc and a half per ton. The measure may cause capital now profitably employed in other ways to be diverted to shipbuilding, and may thus rear up another artificial and weakly industry. It may also stimulate the employment of French ships on distant voyages. But, unless the trade can be increased at the same time, they cannot find freights, and the vessels will thus be useless. It is, indeed, one of the anomalies of the Bill that it does not require the vessels to which premiums are offered to carry cargoes. The opponents of the measure assert that French sailors are less skilful than English, American, Norwegian, Swedish, or German, and consequently that French crews require to be more numerous. If so, the additional cost of navigating the vessels will have to be deducted from the premium. Further, they

that French captains are less skilful and enterprising than foreign competitors—have less initiative, in short—and never think of seeking out cargoes. The Bill will certainly not help to remove this cause of inferiority. Lastly, it is to be borne in mind that the premiums on construction profess to be no more than compensation for the heavy duties levied upon the materials of shipbuilding. Granting that they are, in fact, very much more, still they are by no means so large as they seem to be, because a portion of the amount really does consist in such compensation. It may safely be concluded, then, that the measure will not accomplish what is expected from it, and need not alarm our own shipowners. If the French mercantile marine is to receive new life, that new life must be imparted by the enterprise and energy of French shipowners.

MEFISTOFELE.

IT is long since so important an operatic event as the production at Her Majesty's Theatre of Signor Boito's *Mefistofele* has taken place. It would be rash after one hearing to pronounce a final decision as to the particular merits or demerits of a work of this calibre, and our judgment must for the present be of a more or less general kind; but it may be safely said that, on the whole, the unusual success with which the opera met on its first representation was well deserved. The work when its composer first produced it at Milan was completely condemned, but was performed again, after revision and excision by Signor Boito, some five years ago at Bologna, with complete success; and there can be little doubt that the result of its addition to the repertory of Her Majesty's will be equally happy. Regarded from a dramatic point of view, Signor Boito's version of *Faust* (he is the writer as well as the composer of his opera) is less fortunate than the French libretto. It is, in fact, rather a succession of scenes modelled on Goethe's *Faust* than an adaptation of that great work, and it demands for its understanding a knowledge—which, happily, is common enough—of the original. The Prologue in Heaven (modified, of course, for the requirements of the English stage) is followed by the Easter Sunday scene, to which succeeds the scene in Faust's study. Then comes the garden scene, and, after the episode of the Walpurgis Nacht, the death of Gretchen in prison. This is the first part of the opera, in which, it will be noted, nothing is heard or seen of Valentine; and the introduction, as a sequel, of two scenes taken from the Second Part of Goethe's *Faust* is necessarily, in a dramatic sense, something of an anti-climax. Some of the music in this sequel has qualities of a high kind; but the fragmentary method of dealing with the Second Part, which in itself is not eminently dramatic, puts dramatic coherence out of the question. The final scene of Faust's salvation, and the baffling of Mephistopheles, has of course true dramatic force; but it has little or no connexion, as the opera is represented, with what has immediately preceded it. In other words, the classical Walpurgis Nacht appears even more episodical than the Walpurgis Nacht in the First Part, and severs the connexion, upon which Signor Boito dwells particularly in his preface, between the First and Second Parts. On this point, however, it will be best to quote the composer's own words. The Fourth Act and the Epilogue, he writes, of the present opera are taken from the Second Part of Goethe's *Faust*, "which is the continuation and necessary complement of the First. Without this continuation the drama remains imperfect in its highly moral scope and development. A bargain is the starting point of Goethe's poem; if the action ceases at Margaret's death, the bargain has never been fulfilled, nor the scheme of the drama properly evolved. The struggle must therefore be prolonged until the death of Faust, who is the subject of the bargain." Theoretically this may sound true enough. Signor Boito's statement, however, is incorrect. There is really no more definite end of "the bargain" in Goethe's Second Part than in his First; and in any case the dramatic interest practically comes to an end with the death of Gretchen. With this indeed the play of *Faust* comes to an end; the Second Part is for stage purposes impracticable.

These considerations, of course, detract in no way from the signal merit of much of Signor Boito's work in the Second Part; but, taken in connexion with one or two other points, they seem to indicate a certain flaw in his power of dramatic perception. The most striking of these other points is found perhaps in the behaviour which he attributes to Faust in the Easter Sunday scene. In this Faust, it will be remembered, in Goethe's play notices the movements of a black poodle, to which he attaches an importance which the duller-eyed Wagner ridicules. Finally, at Faust's invitation, the poodle follows him, and is with him throughout the wonderful scene in the study, during which, after various transformations, he appears in his proper character of Mephistopheles, disguised as a *scholasticus*. For the poodle Signor Boito substitutes a Grey Friar, a change which is pardonable enough. It is less pardonable to make Faust exhibit every sign of terror when the Grey Friar draws near him. To do this is, it seems to us, to destroy Faust's character, and to make of him no better a figure than he is in the French opera. In Goethe's play Faust is throughout master of himself and of Mephistopheles, a fact which is plainly enough shown by his language in the interview between himself and Mephistopheles in a plain beneath a cloudy sky. Here, turning on Mephistopheles, who answers with cold taunts his passionate outburst concerning Gretchen, he cries (we quote from Mr. Kegan Paul's translation) :—"Hound! Detestable monster! Change him, thou Everlasting Spirit! change the worm back again into his dog's form, which he took so often willingly by night, to trot before me, to catch the harmless traveller by the feet, and hang on his shoulders when he had overturned him. Change him again into the form he loves, that he may cringe before me on his belly in the sand, that I may trample under foot the accursed thing!" These are not the words of a man who could be frightened at the semi-spectral appearance of a Grey Friar; but, indeed, to those who have any acquaintance with Goethe's *Faust*, no quotation is needed to show the utter falseness of the idea which Signor Boito has needlessly imported into his opera. This, however, it must be admitted, is in itself a comparatively small blot upon a work of much merit.

As we have said, it would be unwise to speak with any absolute decision of certain parts of Signor Boito's opera after only one hearing of it, and, as far as the Prologue is concerned, faults in the first night's rendering, depending probably upon the fact that the "Chorus Mysticus" sings, and a second band plays, from behind a bank of clouds, made it difficult to appreciate properly what seemed to us nevertheless music of much imagination and grandeur. Mephistopheles's music in this scene is strong and effective, but perhaps less original than the song in which in Faust's study he describes his mission. The words of this, which has a strange and striking whistling refrain, are not a bad specimen of the style of Signor Boito's libretto, and on that ground we quote its first stanza:—

> Son lo spirito che nega
> Sempre; tutto; l'astro, il fior.
> Il mio ghigno e la mia bega
> Turban gli ozi al Creator.
> Voglio il Nulla e del Creato
> La ruina universal.
> È atmosfera mia vital
> Ciò che chiamasi peccato
> Morte e Mal!
>
> Rido e avvento—questa sillaba
> "No."
> Struggo, tento,
> Ruggo, sibilo,
> "No."
> Mordo, invischio,
> Fischio, fischio, fischio!
> (*fischia violentemente colle dita fra le labbra*).

A devil who whistles violently through his fingers like a gallery-boy does not sound perhaps, when the action is described in cold blood, a very imposing personage. The effect, however, in Signor Boito's hands is, as we have hinted, both startling and impressive. This scene also contains a beautiful opening melody for Faust, and ends with a fine duet, followed by the magical disappearance of Faust and Mephistopheles riding on Mephistopheles's mantle. The Easter Sunday scene, which precedes it, has much liveliness, both in the musical and the dramatic action. The garden scene is throughout meritorious, and ends with a strikingly fine quartet with a laughing refrain. Here, whatever faults he may have made in other directions, Signor Boito seems to have seized the full meaning of Goethe's tragedy. It is difficult to imagine anything more completely pathetic than the music at this point, the pathos being of course increased by the fact that it underlies the seeming gaiety; and, as is often the case with great effects, the simplicity of the composer's method at this point is not less remarkable than his success. With the completeness of this success Mme. Christine Nilsson had much to do. She has never surpassed, seldom perhaps equalled, her performance throughout the opera in the two characters of Margherita and Elena; the suggestion of a sob in each refrain of ringing laughter in this quartet seemed to us such a thing as only genius allied with the highest art can accomplish. The Walpurgis Nacht scene, admirably put on the stage, is occupied with music which is infernal enough in its character; and one passage, a chorus *à bouche fermée* of adoration of Mephistopheles, is in a marked degree original and striking. The prison scene has much pathos, and one duet, "Lontano, lontano," is charged with tenderness and beauty. Here again Mme. Nilsson's acting and singing were of the highest order.

The Second Part has two scenes only, the "Sabba Classico" and the death of Faust. The first of these opens with a beautiful duet for Elena and Pantalis, exquisitely sung by Mme. Trebelli and Mme. Nilsson, and has also some fine concerted music; but dramatically it is, as we have already pointed out, an excrescence upon the opera. The last scene or epilogue passes between Faust and Mephistopheles alone, and with a keen sense of musical and dramatic effect the composer has repeated in it the theme of the Prologue. The fine singing and acting of Signor Nanetti, by far the best Mephistopheles we have ever seen on the operatic stage, with the exception of M. Faure, contributed much to the effect of the scene. His despair at the end was rendered with singular force and skill. For stage purposes his being baffled by an open Bible is somewhat ineffective; a crucifix would be far more to the purpose. It would be interesting to know what Signor Boito means by the stage direction prefixed to this scene:—"Faust seduto sul seggiolone e conturbato medita. Mefistofele gli sta dietro come un incubo."

To this first general review of a work of undoubted importance and distinction, it remains only to add a few words as to its interpretation. Mme. Nilsson, as we have said, was at her best. Never has either her singing or her acting and by-play been exhibited to greater advantage. Signor Campanini as Faust

sang and acted almost as well as he does in *Lohengrin*, but he would do well to modify his get-up in the last scene, which is too *voyant*. Mme. Trebelli sang Marta and Pantalis, and showed how much the presence of a great and complete artist in a comparatively small part may influence the effect of an opera. Signor Nanetti's acting and singing of Mefistofele were masterly. Signor Grazzi, whose name did not appear in the cast, sang Wagner in the First Part and Nereus in the Second with much credit. The stage management and the scenery deserve much praise. We shall have more to say of the opera on a future occasion; meanwhile, Mr. Mapleson may be congratulated on the happy result of his enterprise.

Even a necessarily incomplete notice of Signor Boito's work has left us little room for writing of other events at either Opera House. We must, however, devote a few words to noticing the welcome reappearance at Her Majesty's of Mme. Gerster, whose voice, style, and acting seem all to have improved during her absence from the London opera stage. Her performance on Thursday last, in *Linda di Chamouni*, left no room for criticism; and it is hardly too much to say that people who have not been fortunate enough to hear Mme. Otto-Goldschmidt may find consolation for their loss in the fact that they can hear Mme. Gerster.

REVIEWS.

WHEELER'S SHORT HISTORY OF INDIA.*

THIS is a compendious History of India, but it has a more extensive range than other similar works. It comprises not only the history of India Proper, but of the neighbouring States of Afghánistán, Nípál, and Burma. We cannot pay the author a higher compliment than by saying that we have read every page of it. This is sufficient to prove that the work is made interesting, and it would be pleasant to be able to commend it as satisfactory and complete; but it has too many errors and defects to allow of an honest general approval. So long as Mr. Wheeler confines himself to narrative he is spirited and generally accurate; but when he attempts to penetrate into and explain hidden motives, when he has to deal with circumstances which, to use a favourite phrase of his, are "very suggestive," he often succeeds in discovering much that has no real existence. In short, his imagination too frequently gets the better of his reasoning powers, and he comes to conclusions for which the facts afford no sufficient warrant. The volume abounds with explanatory notes. Some of them, which deal with matters within the author's personal experience, are amusing and instructive; but there are others which display an amount of error which is surprising in a man of his great reading and long Indian experience.

The history of India divides into three great periods, the Hindu, the Muhammadan, and the British. In this book the histories of the two former periods are mere abstracts of Mr. Wheeler's large *History of India from the Earliest Ages*, in three volumes. The history of the British period is new, and, according to the author, it is "an entirely independent work, drawn direct from the fountain-head, after a study of the records of the Government of India, official reports, and Parliamentary Blue-Books, and of such current annals, memoirs, travels or correspondence, as have been found to yield historical materials." The term "fountain head" is not very definite, but it may probably be assumed to cover the writings of Elphinstone, Mill, Wilson, Mr. Grant Duff, Sir John Malcolm, and other works of authority which have certainly been largely used in the composition of this book. Without them, indeed, its production would have been impossible. The Hindu period in this work, as in the larger History, begins with the Mahá-bhárata. In a subsequent chapter we get some glimpses of the immigrant Aryans who found their way into Upper India many centuries before the composition of that poem. But the long and interesting period between the Vedas and the heroic poems receives no regular notice. It is true that the Vedic Hymns do not afford materials for a consecutive history; but they give many pictures of the state of society and civilization, of the polity and religious system, of the learning, and of the knowledge of the mechanical arts among that ancient people. The history of a people and country is not confined to a chronological knowledge of events. However, Mr. Wheeler begins with the "Mahá-bhárata about B.C. 1500-1400," and tells us that "India, in ancient times, was parcelled out, like Palestine and Greece, into a number of small kingdoms, each under the government of its own Rája. Every Rája had a council of elders, including chiefs and kinsmen, who were collectively known as the Durbar." The India of those ancient times of which we have any knowledge was Upper India only; and, although it is probable that each Rája had a council, it is quite certain that it was not "known as the Durbar," for this is a modern Persian word unknown in India for more than two thousand years after the period in question. We observe, too, that Mr. Wheeler speaks at this early period of Rájpúts—or, as he persistently writes the word, Rajpúts—but the Rájpúts are the modern descendants of the Kshatriyas of the Vedic and heroic times. The first two chapters contain very clear abstracts of the Mahá-bhárata and Rámáyana, but in these, as throughout the book, wild work has been made of accents; they would almost seem to have been scattered haphazard, and are sometimes omitted where most required. The accents are used to mark the long vowels, and these long vowels generally, though not invariably, attract the accent or stress of pronunciation. Mr. Wheeler invariably writes Raja for Rája and Mahâraja for Mahárája, Madrí for Mádrí, Sákuni for Sakuni, Kicháka for Kíchaka, Dándaka for Dandaka, and Rajpútana for Rájpútána, in which latter word the accent falls on the third syllable. Better have no accents at all than to have them so misused. A collection of all the errors of accent would form a long list of errata; but it ought to be made, for the uninformed reader will otherwise be led astray by an appearance of authority. Errors of interpretation also occur, as in p. 3, where the name Dhritaráshtra is interpreted as "the Blind," which is a mere inference from the fact that the king was blind and that he was named from his infirmity, as his brother was called "the Pale" from his fair complexion. The name really means "Maintainer of the Country."

The chapter on "Religion and Literature" begins with an account of the castes, and the Kshatriyas and Vaisyas are spoken of as if they were still in existence; but "the twice-born" Kshatriyas and Vaisyas are gone; they have become degenerate and mixed, and have forfeited their spiritual privileges. The Kshatriyas are represented by the Rájpúts, and the Vaisyas by different trading classes, among them the Banias of Bengal; but it is from no "unknown cause" that these "have ceased to wear the thread of the twice-born." The interpretation of the law has long been in the hands of the Brahmans, and they have decided that the second and third castes are extinct, and that their degenerate descendants have no right to the privileges of their remote ancestors. The traders have occasionally struggled against this exclusion, but in vain. A caste called Komtís, claiming to be Vaisyas, prosecuted their claim through various courts up to that of Her Majesty in Council, but they failed in establishing their pretensions. This book describes the four castes, and the Párias or outcasts; but it says nothing of the multitudes belonging to the numerous "mixed castes" which intervene, and which form perhaps the bulk of the Hindu people. Mr. Wheeler's opinions on the Hindu religion are bold generalizations, in which he will find very few to agree with him. He says:—

> The religious ideas of Turanians and Aryans have been so closely interwoven in the course of ages that it is perhaps impossible to treat them as race distinctions. It may, however, be broadly stated that the religion and literature of the Turanians were derived from the mysteries of death and birth, of which Siva, Mahádeva, and his wife Kálí, or Durgá, were originally personifications.

The "mysteries of death and birth" occupy a prominent place in many religions; but that Siva and his consort are of Turanian origin is a venturesome statement opposed to all evidence. By "Turanians" Mr. Wheeler appears to mean "the so-called aborigines of India," the Drávidian stock. No doubt the old Aryan myths and legends have been to some degree affected by their contact with the Drávidian races, but to nothing like the extent which this book represents. The whole of the remarks on religion are very speculative, and some of them are certainly erroneous, but they must be passed by, as the proper treatment of them would require more space than can be here afforded. One inaccuracy may be noticed, because it can be set right in a few words. "Saraswatí, the goddess of learning, was originally the divinity or spirit of the river Indus," which river "is often invoked as the goddess Saraswatí in the Vaidik hymns." It was not the Indus, but the river Saraswatí, which appears in the Vedas as both a goddess and a river. This river is now known as the Sarsutí, a shortened form of Saraswatí, and as the Kágar, which, after flowing a considerable distance from the slopes of the Himálayas, is swallowed up in the sands of the desert. In ancient times it would seem to have run on to the sea, and it was one of the boundaries of Brahmávartta, the early home of the Aryans in India.

The second part of the work, on the Muhammadan history, gives a very lively and intelligent summary; but it repeats some of the errors which were observable in the longer history before published. One objection made to that work was that the author trusted too implicitly to the statements of European travellers. To meet this criticism he takes occasion to remark:—"All that Roe tells about the Court of Jahángír may be accepted as truth, as nearly everything that goes on in the zenána of a Moghul sovereign is soon known outside. Nothing is concealed but thoughts or emotions, and even they are often betrayed." But the objection was not that Roe and others refrained from telling all that happened, but that they learned from scandal-mongers, and recorded a great deal more than ever really occurred. In this division we have one of those surprising notes of which we have spoken. We are told that "the old capital of Bengal at Gour seems to have been named after the ancient Afghan stronghold of Ghor, between Ghazní and Herat." But Gour, better written Gaura or Gauda, was the old Sanscrit name of the country and town long before an Afghán entered India. The change of the *gh* or *ghain* of Ghor into the simple *g* of Gaur is almost a linguistic impossibility. A Persian writer has a much better observation upon it. Remarking upon the very unhealthy climate of the place, he says that the name ought not to be pro-

* *A Short History of India and of the Frontier States of Afghanistan, Nipal, and Burma.* By J. Talboys Wheeler, late Assistant-Secretary to the Government of India, Foreign Department, and late Secretary to the Government of British Burma. With Maps and Tables. London: Macmillan & Co. 1880.

nounced Gaur, but Gor, the two words being written exactly alike in Persian letters, and the last one meaning "a grave."

The history of British India occupies about two-thirds of the book, and is the best part of it. We miss some incidents which might have found a place, but in a condensed history opinions may well differ as to what may or may not be excluded. The author's official position has given him access to records which have not hitherto been fully searched, and new light is occasionally thrown upon some of our early transactions in India. It is not likely that the mists in which these are shrouded will ever be fully dispelled, and opinions will continue to differ as to the merits and demerits of those who founded and consolidated British rule in India. As years have rolled on, men have come to look with a lenient and even an approving eye on the doings of Warren Hastings. But, notwithstanding the magnitude of his services and the manifold difficulties of his position, it is impossible to wholly acquit him of wrongdoing. In the present work Mr. Wheeler takes a more hostile view of his actions than even Mill or Macaulay. His political knowledge of the workings of Indian native States would entitle his opinion to respect, but he has in great measure destroyed its value by false reasoning. He is clearly of opinion that Hastings "exercised and countenanced cruelty and oppression for the sake of money." Hastings had openly accepted one hundred thousand pounds from the Nawáb Vizier. He reported this to the Court of Directors, and asked for leave to keep it, which was refused. Mr. Wheeler considers that this was not only a bribe, but a proof that Hastings had been bribed before. He says:—

Lord Macaulay acquits Hastings of money corruption on the ground of want of evidence; had he been familiar with the workings of native courts in India he would have found Hastings guilty. Hastings acknowledged to having taken a hundred thousand pounds from Asof-ud-daula in 1782. The inference follows that in 1773 he received a like sum from Shuja-ud-daula and silently pocketed the money. Officers of any political experience would be satisfied that Asof-ud-daula would never have offered the hundred thousand pounds to Hastings, unless a like sum had been previously offered by his father, Shuja-ud-daula, and accepted by Hastings.

Political officers may be justified in entertaining suspicions, but arguments like this refute themselves. If Asaf-ud-daula must have had a precedent before he made the present, his father by the same reasoning must have had a precedent also, and how far back must we go for the beginning, if there ever was a beginning? There are two notes in this portion of the work which we venture to correct. Bálá Hissár does not mean "palace of kings," but "high fort," *i.e.* citadel. Attock may have been "identified with Taxila," the Taxila of Alexander and the Taksha-sílá of Hindu writers, but if so the identification is wrong, because, according to Arrian's description, Taxila "was between the Indus and Hydaspes," and if by a stretch this might be considered to apply to Attock, on the river, the matter is made clear by the Chinese traveller Fa-Hian, who visited the city in A.D. 502, and says it was "three days' journey to the east of the river Indus." The exact position of Taxila has been discussed at some length by General Cunningham, who confidently identifies it with a mass of ruins found at a place now called Sháhdharí.

Mr. Wheeler's sketches of the history of Nípál and Burma are good and interesting, especially that of the latter, in which his personal knowledge of the country has enabled him to draw a very vivid picture. But the part of most interest at the present time is the Afghán history, which is brought down to the murder of Sir Louis Cavagnari. The latter portion of this is very properly confined to a mere statement of the most salient facts, but the earlier parts are full for a work of this kind, and show clearly the difficulties to be encountered in dealing with so turbulent and distracted a people. Mr. Wheeler's description of the Afgháns is a fair specimen of his style, and may be quoted to some purpose, now that the Afgháns occupy such a prominent place in the public mind:—

The Afghans are Muhammadans of the Sunní faith; they reverence the first four Khalifs, and have no particular veneration for the prophet (Khalif) Ali. They are split up into tribes, clans, and families, each under its own head, commander, or Sirdar; and they are often at war or feud, and often engaged in conspiracies, rebellions, and assassinations. They are tall, burly, active men, with olive complexions, dark Jewish features, black eyes, and long black hair hanging down in curls. Their countenances are calm, and they affect a frankness and *bonhomie*; they will sometimes indulge in a rude jocularity; but their expression is savage, and evil passions are often raging in their hearts like hidden fires. They are bloodthirsty, deceitful, and depraved; ready to sell their country, their honour, and their very souls for lucre. They care for nothing but fighting and loot, delighting in the din of arms, the turmoil of battle, and the plunder of the killed and wounded; without any relish for home life or domestic ties; without a sting of remorse or a sense of shame. There are no people on earth that have a finer physique or a viler morale. They are the relics of a nation who have played out their parts in history. In bygone ages they conquered Hindustan on the one side and Persia on the other; but the conquering instinct has died away amidst the incessant discord of family feuds and domestic broils.

We have not spared to point out errors, because the work is upon the whole a good one, and deserves to be made better. The author may with great advantage bestow a portion of his leisure upon it to make it what it may be and ought to be—a standard work for students and for men seeking to obtain a general knowledge of India. There are other errors which need not be pointed out, for they will doubtless be discovered, but it may be observed that an undue partiality has been shown for the letter *h*; it is interpolated in many words for which the original spelling affords no warrant—as G*h*ond, Pind*h*ári, Nerbudd*h*a, K*h*ureem, Alamg*h*ír, &c. Lastly, if it is desirable to restore the name of Sadásheo Bháo to its classic Sanskrit form, it would be Sadásiva, not Sivadása.

The work contains a series of maps showing the political divisions of India from the earliest times. It has also a good chronological table and a full index.

PATH AND GOAL.*

DR. KALISCH has hitherto been known by the vast undertaking of an elaborate commentary in English on the Old Testament, based on the Hebrew text and taking note of the principal labours of the old Jewish writers as well as of the modern critical school on the Continent and in England. To complete it on the scale on which it was commenced, a life of unusual length and of vigorous unbroken health, as well as an abandonment of all other literary enterprises, would evidently be requisite. And Dr. Kalisch's qualifications for the self-imposed task are such that the anticipated result may well be held to be a κτῆμα ἐς ἀεί which would reward and justify the necessary self-sacrifice. It would be difficult to find another scholar possessed in equal measure of the two essentials—namely, a familiarity with the abstruse learning of the Rabbins and Talmudists such as it is well-nigh impossible for any Christian scholar, whose early impressible years have been devoted to Latin and Greek, ever to attain; and that modern spirit, alike scientific and reasonable, which cannot away with the artificial Rabbinical codes of interpretation (not to speak of Cabbalistic conceits), a spirit which the classical and philosophical education of Christians at the present day fosters. Unfortunately only the commentary on the first three books of the Pentateuch had been completed when Dr. Kalisch's health so far broke down as to render it extremely doubtful whether he would be able to pursue further a work demanding such long and laborious research. The direct consequence of this is the production of the work before us, which he was able to construct when debarred from severer labour. This fact will impress readers of *Path and Goal* as very remarkable. How vast is the difference of meaning of the word "labour" to different workers in the same field of literature! Most people would regard this treatise, popular and fascinating as it is in form and style, as a work not merely of the highest erudition (which it is), but of the most laborious research, which only a writer in the fullest enjoyment of his faculties could have carried out with such spirit and so much accuracy of detail. Yet Dr. Kalisch throws it off during a period of extreme debility, when unable to prosecute his own special studies. We venture to think that this work will do more for his fame than any of the volumes yet published of his Commentary. But we must attempt a description of this very clever and suggestive book.

For a discussion on the elements of civilization, &c., which shall be more than ephemeral in time and fatally limited in local colouring, it is obvious that the varied ideas and systems of thinkers who have successively or contemporaneously occupied the intellectual stage of the world must be impartially represented; and therefore the form of dialogue, which Dr. Kalisch has adopted, is the best fitted for the purpose. As the title seems scarcely to express adequately the momentous issues with which the work is concerned, we quote from the publishers' "Notes on Books" a fragment (presumably written or sanctioned by the author), which makes both the aim and the manner clearer:—

The purpose of this work is threefold—first, to ascertain the elements which constitute our *modern civilization*; secondly, to examine which of these elements are requisite to produce *harmony of character*; and, thirdly, to prove that only through this symmetry of powers true *happiness* is secured. With these objects in view, a number of speakers . . . are introduced, all distinctively representative; there are Christian theologians—the uncompromisingly orthodox, the profoundly spiritual, and the conciliatingly latitudinarian; there are biblical critics—the sober and the over-refining; there are the Jewish Rabbi and the minister of Jewish Reformers; there are the ardent advocate of Greek culture, the champion of art, the votary of philosophic speculation, and the staunch adherent of the most advanced school of modern science; there are, besides, four Eastern scholars—a Hindoo, a Parsee, a Buddhist, and a Mohammedan—who take part in the discussions; and there is, lastly, the host in whose house the meetings take place, and who embodies, as much as is possible, the desired harmony of mind.

The scene of the discussion is appropriately fixed near London, during the year of the International Exhibition—a time and place at which an exchange of ideas between members of the various Western and Eastern civilizations is most easily conceived; and the host is a cultivated English Jew, descended paternally from a family of Spanish Jews, and on the mother's side from a German stock. Such a man, having received an English classical and scientific as well as a Hebrew Biblical education, is well chosen as the representative of those who can feel sympathy with the various schemes surrounding them, while standing personally somewhat aloof from all alike. Thus it happens that this Gabriel de Mendoza, who interferes only very occasionally with the course of discussion, is at the end the only person not too much pledged to one side of the controversy to bring it to a close by gathering up the threads of argument and weaving them into a fabric which the different disputants can accept. It must be added that great skill is exhibited in the conception and maintenance of the individuality of each speaker. To keep up such individuality of character through five hundred large octavo pages of rather small

* *Path and Goal: a Discussion on the Elements of Civilization and the Conditions of Happiness.* By M. M. Kalisch, Ph.D., M.A. London: Longmans & Co. 1880.

print is no small achievement; and yet it is done so well as to compel the reader to fancy that either he himself, or at least the author, must have personally known the original. It is scarcely necessary to add that this form of dialogue, so ably managed, lends to the book a vivacity which is most welcome where the subject is so grave.

The subject is approached in an exordium containing a translation and a little desultory conversation on the book of Ecclesiastes, which leads the host to remark:—

As it appears to me that the Book of Ecclesiastes mainly relates to the *enjoyment of life*, which very closely concerns us all, may I suggest that this question form the subject of our discussion at our next meetings, and that we accordingly inquire by *what system of religion or philosophy* true enjoyment is best attained and secured?

The latter italics are our own, and are used to draw attention to the fact that the treatise virtually deals with the first principles of religion, the relation between God and nature, between God and man, the existence and the essence of God. The reason why the word "religion" is (perhaps sedulously) avoided in the title appears to be that religion and God are the very subjects of speculation, which therefore could not be announced beforehand as if they were assumed as axioms.

After this the discussion becomes lively enough. An enthusiastic picture of the joyousness of the life of the ancient Greeks in the midst of their marvellous works of architecture, poetic art, and lovely nature, which to them was full of superhuman forms of beauty and grace, elicits from Humphrey, the "uncompromisingly orthodox"—who, always combative, commands our respect by his learning and consistency—the declaration that "the much-vaunted happiness of the ancient Greeks must . . . be reckoned among the most unaccountable of popular fallacies." He is soon driven to cite, as the most convincing instances of Greek life being anything but happy in its spirit, the "two monstrosities opposite in character but equal in hideous noxiousness—the sect [sects] of the Cynics and of Cyrenaics." But from this position he is again driven by speakers who contend that the independence of outward luxuries and public opinion, and the reliance on personal truthfulness, patience, and faith, which distinguished the nobler Cynics more than their rough eccentricities of behaviour, produced a happiness of soul unknown to worldlings, and he is obliged to assail the Stoics. These, he pleads, confessed the miseries of human life so candidly as to sanction escape from it by suicide. "Suicide they legalized and declared heroic, and they resorted to it without any sense of its criminality." Here he is immediately and ably answered by Dr. Mortimer, the "latitudinarian" canon of his own Church, who shows the Stoics in a new light, as retaining moral purity and intellectual liberty in an age of despotism and license, and as prompted to "conceive the idea of a universal community, to consider themselves as citizens of the world, and to realize the scheme of a united mankind, governed and guarded by an omnipresent and bountiful Deity, the world-pervading primeval Cause, at once supreme Reason and supreme Love." The discussion which naturally ensues digresses from the original question concerning happiness to the more general one of the Stoic ethics and religion, and their relation to the Hebrew and Christian. Hermes, the enthusiast for Greek culture, produces Seneca's description of the *vir bonus*, and concludes, "How much is wanting to complete the figure of a 'Servant of God' or 'a suffering Messiah'?" The host corrects the extravagance of Humphrey's indictment on the score of suicide, and reminds the company that "Seneca exhorted alike to 'a fortitude of dying' and 'a fortitude of living,' to a frame equally averse to a passion for life and a passion for death"; and that "Epictetus said that, if disciples consulted him on this point, he would answer, 'Wait for God; when he shall give the signal and release you from this service, then depart to him; till then, persevere in the duties he has imposed upon you"—and so forth. This leads to a more detailed discussion on "the Stoic and the Christian." Humphrey, unable to deny the lofty ethics of the best Stoics, adopts tactics not unknown to disappointed party politicians, and maintains "that the later Stoics borrowed their best doctrines from Christianity, and then surreptitiously foisted them on the founders of their sect"; and he proceeds to claim Epictetus and Seneca as Christians, while the Rabbi Gideon calls Marcus Aurelius a secret Jew, and believes that Zeno himself was a Hebrew—on which the Brahman pertinently observes:—"Surely, great and good must those have been whom all races and creeds are proud to call their own." It is now Abington, the "profoundly spiritual" Anglican theologian, and one of the best conceived and most interesting of the disputants, that gives a different tone to the discussion. He begins with the debatable propositions "that the end of all historical development is Christianity, and that ancient history is merely 'a prophecy heralding Christ'"; and proceeds to the assertions, which can scarcely bring conviction to hearers not previously inclined to believe them, that "it is only Christianity which has established a supreme aim and a universal purpose in the idea of a Kingdom of God and its glorification by means of a living and active theism; and it is only Christianity which has discovered the indispensable consonance in which every individual should live with the general law of a moral order of the world." Considering that the Pagans were incapable of conceiving a deity essentially distinct from man, while the God of Christianity was a Spirit, a being existing above and beyond all nature, he attributes to the former a pantheism and materialism which can never satisfy, and assigns to the Stoic more melancholy resignation, while the feeling of dependence on God brings to the Christian joy. Protests against this *ex parte* declaration are now hurled at the speaker, and declarations in favour of the Stoics, and especially of Marcus Aurelius, are so powerful that Abington is forced to make a partial concession, admitting "that life, conscience, and reason, supplied some of the heathen with a partial knowledge of God—with a kind of natural religion," and so forth. After a profoundly interesting but rather desultory conversation, in which the Orientals take their share, the host sums up, condemning the doctrines of vicarious sacrifice, election, and eternal damnation, on which he says the felicity of the Christian is unfortunately based, and concluding:—"While the Stoic's philosophy contributes to our happiness the element of self-dependent strength, the Christian's creed furnishes the no less important constituent of hopeful reliance; for without hope man could not bear the sternness of life."

The next discussion is upon Epicurus and his school, towards whom the Anglicans, the Rabbi, and the Buddhist feel the utmost repugnance, while Hermes expounds their ethical principles philosophically, and so as to win the approval of the Mohammedan and the Brahman. Attinghausen, "the adherent of the most advanced school of modern science," in other words, materialist and Darwinist—perhaps the best drawn character, endowed with copious eloquence and eagerness, the greater because he has to fight his battles mostly alone, and portrayed with much humour, if not without some exaggeration—transfers the discussion from the ethics to the physics of Epicureanism, which he affirms to have the conspicuous merit of destroying "the Socratic fallacy of a teleological design in nature," and "the doctrine of Creation by substituting the natural and fortuitous combination of an infinitude of eternal and indestructible atoms." From this point the next discussion naturally proceeds to consider the "Dignity of Man," as affected by the scientific Monism of Attinghausen—"that general law of evolution which teaches true humility, inspires true love, fans true fellowship with every part of nature and every living being." It touches on the question of the origin of species, the evolution of man from the ape, the language-test; the proofs of a personal God and Creator, advanced by Mortimer, are by the naturalist declared insufficient; and the latter gives his views on cellular organism, decay and re-creation, soul, &c. The discussion on immortality which ensues is naturally eager and heated; but Attinghausen, who refuses to accept most of the theists' premisses, remains logical, and demolishes their course of argument with some success, till Abington at the end seizes on a vulnerable point—the admission of "the existence and the power of the human conscience as an agent of morality"—and argues that this is an acknowledgment of God; which again leads to a belief in the eternity of the soul, whereby alone the aspirations of the soul can be realized. Pantheism is next tried as a *via media*; and especially the system of Spinoza is carefully weighed, with the general result that it is not really philosophically accurate and self-consistent. The naturalist declares that there is no evidence of beneficent design in the world, the instances adduced in favour of such design being balanced by an equal or greater number on the other side; consequently man is to expect nothing, and so he will not be disappointed. The pessimist finds his happiness in simple resignation. This attracts the attention of the Buddhist, whose creed has much in common with it. He speaks well, and his argument emphasizes the idea of Duty as the impulse of action. But his contact with the ideas of the duty of striving and action inherent in the Western religions has greatly modified his Oriental conceptions of the attainment of Nirvâna by seclusion and meditation, and enables him to make the following avowal:—

Our supreme good is peace of mind, and our idea of duty—our *dharma*—which is incessantly inculcated, is compassion or charity; but, instead of seeking tranquillity through benevolent deeds, we unfitted ourselves for the latter in the same measure as we approached the former. I now see that we need not, nay must not, turn away from the world and the sweetness of social communion; that the "City of Peace" may re-echo with the inspiriting sounds of life and action, of zeal and emulation. . . . This must henceforth be our Nirwâna.

Mendoza, the host, sees herein the possibility of effecting a harmony or *eucrasia* of the contending systems, to which it is impossible to do justice in a few lines of epitome. He does not seek to establish a religious system which can satisfy the cravings of every soul; on the contrary, he fully acknowledges that deeper sentiments, on which all cannot agree, are necessary to supplement the principles he lays down. But up to a certain point, he thinks, we may all find ourselves in harmony; and the consciousness of even such limited harmony is a great consolation. He says towards the conclusion:—

We shrink from fixing our views in stagnant formulas. . . . If, renouncing a high-wrought beatitude, we desire no more than a calm and uniform Contentment, we are at least safe from terrible outrages, errors, and crimes. Moreover, we are eschewing what has hitherto been the bane of the world. Every positive religion, while uniting its own adherents, has caused a separation and estrangement from the rest of mankind . . . . but we are trying to diffuse principles which, derived from our common struggles and aspirations, shall bind together all men by the same strong ties of fellowship. . . . And what are those principles? What are the main features of this theory as they have been evolved from our discussions? They are these:—The Stoic's unshaken Fortitude, through the dominion of reason; the Hebrew's or Christian's Peace, through the union of the soul with the Eternal; the Epicurean's fearless Freedom, through the conquest of superstitious fears and beliefs; the Monist's deep and vivid Sympathy with every creature and all Creation; Spinoza's Intellectual Love of God—that is, the Love of Truth for its own sake, with the serene clearness it engenders; the Buddhist's humble Resignation, Compassion, and unselfish Benevolence; and, lastly, the Greek's Idealism and Refinement, manifested in Beauty and Art. Whether we are conscious of it or not,

whether we avow it or not, these are the chief ingredients of our present civilization, which correspond with man's principal faculties and instincts.

We need add no more, unless it be to say that those who expect to find one or more of the disputants absolutely demolished, and others absolutely victorious in the end, will be disappointed. Some may be shocked to find so much liberty of speech and argument accorded to those whom they may regard as mere random Atheists. But such thinkers are not in the world demolished by the word of a preacher; and why should they be here? Dr. Kalisch has not attempted by controversy to reduce any religion or school of philosophy to silence; but, while doing equal justice to all, to find certain common principles in which all may find contentment and brotherhood.

ENGA.*

It is not often that a reviewer lays down a novel with the certain conviction that he could have written a better one himself. He is generally too well aware of the extreme antiquity of all plots, and too tired of the monotony of all fictitious situations, even to contemplate the idea of working in such stale materials. By some provision of nature, which certainly cannot be explained on any theory of the benevolent government of the universe, novel-writers are blind to their own colossal impudence in the matter of using stock incidents and outworn plots. If they knew more, they could not write as they do. It is not the impotence of the reviewer, as authors are apt to say, but his conscientious sense of the dulness of the romantic stock in trade, that makes him a critic instead of a creator. He knows he never could have the "cheek," as schoolboys say, to offer to the public the stuff which novelists daily and hourly manufacture. But the humblest of reviewers would be forced to admit that he could not help writing a better novel than *Enga*.

We say this with pain, for *Enga* is a story which it is almost cruel to criticize severely. There is an amount of guileless good intention in it, a want of experience of life, a confiding trustfulness, which disconcert the critic. To analyse *Enga*, to point out its extraordinary lack of art, to call readers to notice the entire absence of the gift of story-telling here displayed, is like striking a child; we feel that vindictiveness is out of place, though "last night we wasted hateful hours," as Mr. Tennyson says, over the perusal of *Enga*. Most people possess excellent and blameless acquaintances who have only one fault—they bore one by attempting things for which nature never meant them. They aim at humour or sentiment. The author of *Enga* affects us by his writing as these good people do by their talk. He or she has a host of good qualities. He (we sincerely hope it is "he") takes a pleasant sort of interest in nature, and chiefly in the nature of the Scotch country where highland is melting into lowland. When he speaks of rivers, of hills, of lochs, of woods, of the homes and fields of the upland cottars, of the life of the peasants of the country town which is neither lowland nor highland, neither Celtic nor Saxon, he speaks well, and makes us see what he describes. The air of Spey-side breathes through the pages. But a novel cannot be all description; you must have characters to people the glens and villages, and these characters must have adventures and passions. The characters in *Enga* have plenty of passions and adventures; but how horribly these are mismanaged! Even if the story had a grain of originality, instead of being as old as the hills (and a good deal older than the more recent geological formations), it is utterly spoiled in the telling. Criticism of novels has two purposes. The critic acts as a sort of public taster, and tells the student of fiction what to read and what to avoid. In this capacity we can only recommend *Enga* to excessively cautious parents and guardians. They may safely put it into the hands of their very youngest charge. An extremely inexperienced girl, who had never been allowed to peruse anything so exciting as the *Monthly Packet*, might possibly get through *Enga* in a fortnight of wet July weather. It would do her no harm. But people who want to be amused or excited need not waste their time over *Enga*. So much for the first duty of the reviewer—that which he owes to the public. But he has another duty; he has to try to "coach" the author, to point out to him the error of his ways, and to entreat him to write better, if write he must.

The construction of the plot of *Enga* is helplessly inartistic. The author started with this not novel purpose:—He would show us a delightful girl in love with a penniless lad. The young man would go to seek his fortune; the girl's father would die a bankrupt, and the girl herself become a governess. From her distant lover she would receive no letters, and she would be led (by one of the villains who was in love with her) to believe that he was faithless. The lover (who had never heard from the lady) would return, would prove to be the true heir (by a secret marriage) to the landed property of the villain, and all would end happily. This is not a daringly original plot, but it is that of *Enga*. The old stock characters, the true heir "kep' out of his own," the girlish governess, the black-hearted villain who intercepts letters and changes true heirs at nurse, all these are puppets of the most commonplace description. But, if an author is going to use these puppets, and these *ficelles*, and this arrangement of events which has been consecrated by the approval of ages, there is even then a right way and a wrong way of doing the business. You keep the heirship of the true heir dark; you throw no suspicion on the villain, or just enough to make him interesting; and you clear up the whole complication at the end with the aid of a detective, or of the villain's conscience, or by the help of an accomplice, as taste may dictate. Thus innocent readers (and readers are wonderfully innocent) are kept waiting and wondering, till all their fears are put to rest when the true heir leads his Wilhelmina to the altar, and a loyal and happy peasantry are regaled on an ox roasted whole in the park.

The author of *Enga* has preferred to tell his story in another way. With a candid disregard of mystery, he unveils all his secrets in the first few chapters. He introduces you to a rural tailor, who has a pretty sister, Marion. The pretty sister is so fond of scenery that she walks alone every evening by the river, in the grounds of the young laird of Lerne. When she comes back at night, she tells the tailor how the river is getting on, and, we presume, gives her opinion as to whether the stream "will fusch." Here is an innocent tailor, to be sure, and a girl whose devotion to the river reminds one of Tyro in the Odyssey. "She loved a river, the divine Enipeus, far the fairest of the floods that run upon the earth, and she would resort to the fair streams of Enipeus. . . . . And she bare Pelias and Neleus," and so forth. Remembering this classical result of an affection for river scenery, the reader of *Enga* is not surprised when pretty Marion goes to stay with an aunt in the Highlands, and comes back, in some two years, a changed and melancholy girl. The reader knows, and the aunt knew, though the tailor does not, that she has not been so far away all the time, and that she has been secretly married to the laird. The poor laird is drowned in the (perhaps jealous) river, and then the author of *Enga* gets fairly under way with his plot. The problem is how to secrete the drowned laird's son, and put him into training as a true heir in disguise. This is how it is managed. A woman named Nell, with her husband, and a villain named Birkie Will, go "burning the water"—that is, poaching with torches and salmon spears. They are detected, and brought before the new laird, the cousin of the drowned one. He lets them go free, on condition that Nell will conceal a baby who is in the neighbouring manse. Nell goes to the cottage, recognizes Marion, and acts as thus described:—

> She left Gilbert Innes's presence under promise to remove the nameless infant and find him a foster-mother; but before returning to Rory in the grieve's cottage, Nell discovered a packet of papers, which she was able to abstract without disturbing their unconscious owner. Having been introduced into the room of the sleeping mother through the connivance of an old Highland nurse, and observing a parcel of papers under her pillow, it was the work of a moment for Nell to transfer them without any scruple to her own pocket.
>
> But if her agitation had been great on identifying the young mother, she found it difficult to control her indignation on becoming aware of the contents and importance of the papers. Unfolding the first, round which the others were tied, she found that it bore the date of August of the previous year, and was nothing less than the certificate of marriage of the late Hugh Innes of Lerne with Marion Comyn, the unfortunate mother. It was a bona fide certificate duly attested. Nell had been taught at the parish school, and was enough of a scholar to read it throughout.
>
> Scarcely glancing at the other documents, which were all subsequent letters from Hugh Innes to his wife, her eye however fell on that in which the marriage lines were folded, and she read the first portion, to the effect that he (the writer) had announced their marriage to his cousin Gilbert, and was only waiting for the birth of their child to break the news to the relations on both sides.

Here is all the mystery out at once, and in how recklessly artless a style the thing is managed! One does not know whether to marvel most at the innocence of laird number one, who got up the mystery about his marriage, or at the guileless conduct of laird number two, the villain, who allowed the papers to lie about, or at the uninquiring natives of a rural district, who never gossiped about the imprudent young people who must have compromised themselves pretty freely. Perhaps the idiotic behaviour of the villain, who, after educating the true heir, allowed him to come and hang about the neighbourhood where the mother lived, is the most astonishing thing of all. It was quite in keeping with the villain's character to fall in love with the heroine, Enga, betrothed to the true heir, Allister Angus. It was also like the villain to lend Enga's father large sums of money with the purpose of ruining him, which was entirely superfluous, as the absurd old man was capable of ruining himself without assistance. The villain was all himself when he persuaded Marion that she had never been married at all. We recognize the villain, too, when he manages to send Allister to Australia, and despatches Birkie Willie to the Bush with the false tidings that Enga is faithless. As newspapers and letters do not exist in the Bush, Birkie Willie of course succeeded. The villain also seems to have stopped Allister's letters to Enga, but this was managed in so subtle a fashion as to escape our weary notice. In all these things, then, the villain was a right villain, and did his level best. It was only in trifles like letting Nell casually pick up important papers, and in permitting Allister to loaf about the scene of his birth, that the villain was less crafty than himself. Even Allister was puzzled, just as we are. "There are some things about my education and upbringing altogether that baffle me to understand." They baffle us to understand also, for who can unravel the wiles of a second-rate villanous mind not in unity with itself?

After the disclosures of the first few chapters of *Enga* the possible interest of the plot is of course hopelessly lost. We do not weep for Enga's low estate as a governess; we do not linger over the "wut" and Scotch jokes of the little country town. The disinterested young doctor who falls in love with Enga is

* *Enga*. By the Author of "The Harbour Bar." 2 vols. London: Macmillan & Co. 1880.

obviously only to be used as a means of giving Allister quinine and true news about Enga. Birkie Willie may load his pistol and lie in wait for people, but he does not alarm us. Nor does the flood which threatens Enga's life cause us the slightest anxiety. The happy marriage of the young people has been too obviously "a put up thing," in American phrase, from the beginning.

The author of *Enga* might possibly succeed in a sketch of peasant life, if he took great pains and never went outside the limits of his own observation. He has tried, however, to construct an exciting plot, and has carefully cut all the interest out of his own construction. The story of *Enga* has nothing original except the unusual innocence of a writer who could offer such a scheme of romance to the public. We have already expressed the regret which we feel in performing the unpleasant task of condemning an innocent and harmless book. But while authors offer such works to be criticized, and while the reading of a dull story is a weariness to the soul, the most good-natured critic must speak his mind.

SHORT READINGS IN SCIENCE.*

In a little volume the contents of which originally formed one of the evening discourses delivered before the British Association at Sheffield last year, Professor Ray Lankester sets forth in a popular form the theory of degeneration propounded by Dr. Anton Dohrn of Naples, as a necessary complement to the Darwinian doctrine of evolution. It is not to be supposed that the hypothesis here advanced militates in any degree against what has come to be regarded as a fundamental article of the modern scientific creed. On the contrary, it is shown to flow out of, and to be scientifically involved in, the Darwinian principle itself. There are, as the eminent propounder of the theory has from the first admitted, forms of animal and plant life for which we fail to account by the principle of natural selection. These forms are such as we see imperfectly organized, and which, so far from showing an advance in organization by comparison with their ancestral types, exhibit an arrest, or even a falling off, in structure and function. Dr. Dohrn's investigations and reasonings lead him to believe it possible for a set of forces such as we sum up under the head of natural selection so to act upon the structure of an organism as to produce one of three results; either to keep it *in statu quo*, or to increase the complexity of its structure, or, lastly, to diminish that complexity. We have thus as possibilities either balance, or elaboration, or degeneration. With regard to the class of parasitic or quasi-parasitic animals, naturalists have, as our author allows, long recognized what is called retrogressive metamorphosis as a process of degeneration. But this only makes it the more remarkable that the hypothesis of a loss of organization, making the descendant far simpler and lower in structure than its ancestor, should not have been applied to the case of other simple forms of animals. It may serve as a true scientific hypothesis to explain the relationships of many animals which remain a mystery so long as we rely exclusively upon the hypothesis either of balance or of elaboration.

As an example of a class of undoubtedly degenerate animals Professor Ray Lankester takes the very remarkable series of lizard-like creatures, found in the South of Europe and elsewhere, which exhibit in closely related genera a gradual loss of the limbs and a local or limited degeneration. Side by side with the common lizard (*lacerta*), which has five toes on each of its well-grown fore and hind limbs, we have the lizard-like *seps*, in which both pairs of limbs have become ridiculously small, and *bipes*, in which the five pairs of limbs have vanished altogether, and only a pair of stumps remain to represent the hinder limbs. But this local or partial atrophy, well known to naturalists, is not that which our author means by degeneration. This process is brought about when the atrophy extends to a variety of important organs, so that not only the legs, but the organs of sense, the nervous system, and even the mouth and digestive organs are obliterated. A gradual change has then taken place whereby the organism becomes suited to less varied and less complex conditions of life, falling off simultaneously by the process of action and inaction from the ancestral type of structure and function. Any new set of conditions which make its food and safety very easy to attain will lead to an animal's degenerating, just as an active, healthy man often degenerates on suddenly coming into a fortune. This is conspicuously seen among parasites. The shrimp-like animals, Sacculina, Lernæocera, Lepas, Cyclops, and Limnetis, figured in one of our author's woodcuts, all of them start equally with the common simple stage known as the Nauplius. But, while the Nauplius of the free-living shrimp grows more and more elaborate and higher in organization, the parasites as surely degenerate, the most utterly reduced of them, the curious Sacculina, which infests the hermit crab, being a mere sac filled with eggs, absorbing nourishment by root-like processes from the juices of its host.

Besides parasitism, other causes are to be assigned for degeneration. The Nauplius of the ship's barnacle, after a short swim, fixes its head to a piece of wood, and takes to a perfectly fixed, immobile life. Its organs of touch and of sense atrophy; its legs act simply to bring floating particles to the orifice of the stomach. But for its ancestry having been fully made out, what naturalist would ever have guessed it to be a degenerate crustacean? It was, in fact, for a long time placed among the snails and oysters. Not less noteworthy are the degenerate spiders, the mites, leading to still more degenerate forms, the Linguatulæ. Professor Ray Lankester goes on to show that the life-history and structure of the Ascidians—in which Mr. Darwin was disposed not long ago to discern the primitive germ of all more developed life, man himself included—point them out as descendants of animals of higher, *i.e.* more elaborate, structure. They are, in fact, degenerate Vertebrata, standing in the same relation to fishes, frogs, and men as do the barnacles to the shrimps, crabs, and lobsters. The diagrams he gives show the points of correspondence between the young, or tadpole, of the ascidian and of the frog, fortified by their absolute identity in the mode whereby the various organs arise from the primitive egg-cell, established by the Russian naturalist Kowalewsky. The young ascidian, fixing itself by its head like the youthful barnacle, goes through a process of degeneration in order to arrive at the adult structure. The body grows and gradually changes shape; the tail, with its notochord, atrophies, while the cloacal chamber forms. The brain remains quite small and undeveloped, and the remarkable myelonic eye (the eye in the brain, which our author's ingenious anatomical diagrams show to be common in the rudimentary stage to all vertebrate animals) disappears. Another cause of degeneration may be found in a change in the powers and habits of feeding, some animals taking, as green plants do, merely to the carbonic acid dissolved in the water around them, ceasing to hunt their prey, basking in the sunlight, and taking in their food by the whole surface as plants do by their leaves. Their stomachs as well as their locomotive organs, being no longer wanted, become simplified. They are then vegetating animals, the exact complement of the carnivorous plants. Thus a degeneration of animals may be caused by vegetable nutrition. Another possible cause, our author suggests, may be the indirect one of minute size. Natural selection is often seen to act so as to reduce the size of animals, their smallness favouring their survival in the struggle for existence, and many organs, such as heart and bloodvessels, gills and kidneys, besides legs and muscles, being lost as not coming within the needs of a very minute creature.

Our author draws a valuable moral from his researches and speculations. What bearing, he asks, has the agency of degeneration upon the future prospects or destinies of mankind? No scientific man would now maintain that the existing condition of our race at large, far from having been developed out of primitive savagery, is one of decline from a better condition, and that the savage races of to-day are degenerate descendants of higher and civilized nations. At the same time, indubitable cases of degeneration are to be seen in modern Egypt, in Greece, among the heirs of the great Oriental monarchies of pre-Christian times, and among the Indian tribes of Central America. And, as regards ourselves—the civilized races of Europe and America, the heirs of all the ages—is the genial optimism which tacitly assumes universal progress as the law of human evolution to be subject to no doubt or misgiving on a calm and candid survey of the past? Have we improved since the age of the Parthenon and the Aphrodite of Melos in the perception and the expression of beauty of form, or in the personal attribute, for the matter of that, of beauty itself? In poetic power and in strength and purity of speech have we gained upon the age of Shakspeare? In manliness, dignity, courage, and truth, have we higher types than Sidney, Raleigh, or Hampden? Are there no signs of a self-complacent luxury, a contented life of material enjoyment, such as may lead to the atrophy and loss of the valuable qualities of mind and heart inherited and developed through a long line of noble ancestry, just as the ascidian throws away his tail and eye, and sinks into a quiescent state of inferiority? It is by the constant and faithful action of each part, physical and mental, that the living organism has attained and alone can keep up its degree of perfection. And to relax his energies, to wax gross, indolent, inert, self-concentred, will surely be to degenerate in all that has given man his rank in the universal animal scale. He may doom himself to sink, through successive depths of degradation, down to the level of an intellectual and moral barnacle, ascidian, or worm.

The son and namesake of a late well-known veteran writer and lecturer upon botany, the Rev. George Henslow, supplies in *Botany for Children* an illustrated elementary text-book suited to the needs and the apprehension of young people, and specially adapted to take the place of a teacher in their studies of nature afield. The common wild flowers of our meadows and hedge-rows may become not only things of beauty and joy to our school-children, but the means of opening to their understandings in the easiest way much of the workings and laws of nature, and possibly developing here and there a taste and capacity for the study of scientific botany. To discern and note with exactness the minute anatomy of flowers; to discriminate their varieties of structure by comparison with kindred forms; to record in a systematic way all their points of structure; and, finally, to draw every peculiarity of form—such are the steps by which our author seeks to lead his youthful charge through the rudimentary course of botanical study. Up to the age of ten or twelve, and sometimes even beyond that, the aid and sympathy of

* *Degeneration: a Chapter in Darwinism.* ("Nature" Series.) By Professor E. Ray Lankester, F.R.S., Fellow of Exeter College, Oxford. London: Macmillan & Co. 1880.

Botany for Children: an Illustrated Elementary Text-Book for Junior Classes and Young Children. By the Rev. George Henslow, M.A., F.L.S., &c. London: E. Stanford. 1880.

Geography of Northern Europe. By the Rev. C. E. Moberly, M.A., Rector of Coln Regis. Rivingtons. 1880.

a teacher are, he allows, absolutely indispensable. It is consequently at the next stage that a manual such as his properly becomes of service. By this time the pupil will have gone through the needful elementary lessons, and will readily proceed to the classification of the more familiar types of the natural flora. Some twenty-five families or orders of plants have been here selected for study. The clearly drawn woodcuts will assist the learner in at once recognizing the flower which each represents in nature. With the natural specimen in hand he is recommended to dissect and examine it carefully, making sure of each separate point noticed in the text, which will thus form a continuous series of botanical reading lessons. Whilst acquiring, in the first instance, a knowledge of structural botany or morphology, the young botanist will be led to understand in a general way the uses of each separate organ or function to the plant itself, or physiological botany. Such a course will be found, the author justly believes, greatly to enhance the interest of the study, making it something more than a mere acquisition of details, and elevating it to the rank of a pursuit calling into play many of the highest faculties of the mind.

In his *Geography of Northern Europe* Mr. Moberly has brought together as much descriptive and statistical matter relating to half a continent as we can expect to see packed into 160 pages. Whether it is worth while to deal on so microscopic a scale with a theme of such magnitude is, to our mind, open to doubt. The places and topics picked out for notice must be to a great extent arbitrarily chosen, and the notice itself meagre and superficial in the extreme. What can we expect but a kind of stringing together of snips from Murray's or Baedeker's Handbooks, or random cuttings from nursery histories? The luckless child whom Mr. Moberly takes by the hand—if, indeed, his book is meant for children—is hurried without time for taking breath across Germany in less than a score of pages, over the Swiss mountains and valleys under a dozen, and has to do Austria in nine. Belgium and Holland are gone through, their resources summarized, their political future and religious feuds disposed of, in ten highly-compressed pages. The Cimbric Peninsula—not, that is, the Crimea, but Denmark—lumped with Norway and Sweden, Iceland being thrown in as a dependency of Scandinavia in race, speech, and government, are only allowed a bare dozen paragraphs, and, till the Ural mountains interpose a halting line, all the Russias are overrun in the last chapter, extending to ten pages. Room is even found for a partial lifting of the veil from the political prospects of the three great empires, and hints are thrown out to encourage a statesman bent on the regeneration of Russia by urging upon his notice a system of native manufactures under modified protection, "without the poverty and distress which so often attends it." Nearly half of the book is loyally given up to the British Islands, admitting greater fulness of detail, and it would be unfair not to compliment the writer on the number and variety of the loose bits of information that he has contrived to cram into his little manual. From the first rising of Britain's realm out of the azure main to the latest operations of the London School Board, and the newest prospects of the metropolitan water supply, there is hardly a class of fact that does not come within his *farrago libelli*, making it quite a unique achievement in the literature of elementary education.

STEPHEN ON POPE.*

MR. JOHN MORLEY'S series of *English Men of Letters* already includes a goodly number of names both præ-Augustan and post-Augustan; but it is still very far from having exhausted even the list of those writers whom no school or sect of criticism could refuse to rank as "men of leading" in the periods of our literature to which they severally belong. A Life of Dryden is, we observe, not even announced as yet; but the volume on Pope, in entrusting which to the experienced hands of Mr. Leslie Stephen the editor seemed to have made an unusually happy choice, is now before us. Mr. Stephen's intimate acquaintance with a most important branch of English eighteenth-century literature, in which Pope acquired a fame so universal as to be in some measure puzzling to himself, might alone have marked him out for the task; and of the latter part of the poet's literary life few could be expected to write so well as one so thoroughly versed in the works both of the friend who inspired and of the friend who interpreted the *Essay on Man*. Indeed, for ourselves, we confess to having been attracted beforehand to this little volume by the anticipation that in it Bolingbroke would be spoken of with disrespect, and Warburton in the vein of one of the most delightful chapters of the *History of English Thought*. But Pope's philosophy is, after all, but a very small part of him and of his life; the day has, moreover, long gone by in which it could call forth either admiring comment or solemn refutation, and a quite sufficient analysis of the "exquisite mosaic" of the famous Essay has (as Mr. Stephen reminds his readers) been already furnished by Mr. Mark Pattison. But in order that, generally as well as in special points, justice might be done to both the author and the man—and nothing could be truer than that the history of the one is the history of the other "in Pope's life, almost more than in that of any other poet"—the very combination of qualities was required by which Mr. Stephen is widely acknowledged to be distinguished. He is both broad in his sympathies and cool in his judgment; and—if he will allow us to make use of one of "the floating commonplaces" in the *Essay on Criticism* "which have more or less suggested themselves to every writer"—the truth which he tells or teaches is never likely to be disapproved because of a want of good breeding in the way of telling or teaching it. Such a biographer and critic—one who can stick to common sense without lapsing into cynicism—was indisputably necessary in the case of Pope, more especially since the researches of the late Mr. Dilke, and the evidence marshalled with so elaborate a conscientiousness in the volumes hitherto published in the Croker-Elwin edition, had rendered existing biographies of the poet more or less obsolete. It is not at all too much to say that a trustworthy popular Life of Pope had once more become a *desideratum*, unreasonable as the assertion may seem in view of the mass of literature on the subject, and of such useful books in particular as that of the late Mr. Carruthers, of which we are glad to find a kindly mention in Mr. Stephen's preface. This want seemed likely to be supplied by Mr. Stephen himself, who often treats old themes as freshly and fairly as he does new ones, and who in the opening volume of Mr. Morley's series had achieved a conspicuous success by telling over again, with characteristic simplicity and force, the oft-told tale of Johnson's life. We cannot, however, think that in the present instance the result has altogether equalled expectation.

Very possibly, as is often the case, Mr. Stephen may only have discovered while actually at work upon his present subject that he lacks that closer sympathy with it which gives the pleasantest savour to every kind of biographical essay. If so, he deserves all the more credit for not having allowed himself to fall into a carping manner utterly destructive of the true interest of a biography. Nor, on the other hand, has he chosen as a rule to adopt that half-wondering, half-pitying tone which befits the humourist proper; although in reading some passages of this book one is irresistibly reminded of Thackeray's essay on Pope and some of his fellow-wits—a paper which, like so much written by its author in the happier hours of his later productivity, only gains by the keeping. Indeed, in what Mr. Stephen says about one great writer it is difficult not to recognize an expansion of Thackeray's playful remark that Addison "might have omitted a virtue or two, or many." From a more serious point of view one is apt to wax impatient at being told that Addison's praises are not to be read "without a certain recalcitrance, like that which one feels in the case of the model boy who wins all the prizes, including that for good conduct." Is it really so hard to bear the good fortune of the good? In general, however, the impression conveyed by Mr. Stephen's observations on Pope himself is that of an uncertainty of view which seems to hover midway between censure and apology. At one time he takes refuge in Macaulayese antithesis, and denounces Pope as "a liar and a hypocrite," although "the foundation of his character was not selfish or grovelling"; at another he contents himself with an "after all," such as seems most appropriate to a biography, as it does to a novel, without a hero. We need hardly say that on many questions of moral judgment, as of literary criticism, the sound sense of the writer asserts itself with its usual strength. He exposes sufficiently, but without dwelling upon it with wordy unctuousness, a certain affectation of vice in Pope which he justly describes as more offensive than his literary affectation. At the same time he waives aside, as very much out of place in so pitiful a case, the discussions in which others have engaged as to the morality of Pope's relations to the younger Miss Blunt. Unhappily, the little man's hatreds went for at least as much in his life as his loves; and here again Mr. Stephen seems to us shrewdly near the mark when he observes (*apropos* of Pope's wrath against Addison about Tickell's Translation) that

> Pope's suspicions are a proof that in this case he was almost subject to the illusion characteristic of actual insanity. The belief that a man is persecuted by hidden conspirators is one of the common symptoms in such cases; and Pope would seem to have been almost in the initial stage of mental disease. His madness, indeed, was not such as would lead us to call him morally irresponsible, nor was it the kind of madness which is to be found in a good many people who well deserve criminal prosecution; but it was a state of mind so morbid as to justify some compassion for the unhappy offender.

But, as Mr. Stephen elsewhere well shows, this very weakness in Pope had its pathetic as well as its pitiable side, and was not altogether unmixed with a self-respect for which, as we have always thought, our literature owes to him a debt of gratitude. To the friends in whom he trusted, and whom he always chose with that appreciation of real distinction which was natural to him, he clung with touching eagerness; towards the great of the world he bore himself unaffectedly as an equal, and as one whose breath was by no means taken away by his being treated as such.

Of Pope's writings it would certainly be absurd to expect much to be said that should be new; but a critic of Mr. Stephen's keenness and candour will always find an opportunity of saying many things worthy of attention. The *Pastorals* he dismisses briefly, but not too briefly; indeed he might almost have contented himself with the grave piece of irony that "the *Pastorals* have been seriously criticized." The *Essay on Criticism*, on the other hand, we cannot but think entitled to a less condescending treatment than it here once more receives. Besides being "quite sufficiently coherent for its purpose," and full of brilliant "aphorisms coined out of commonplace," it has always seemed to us skilfully exhaustive of the chief

* *Alexander Pope.* By Leslie Stephen. (*English Men of Letters.*) London: Macmillan & Co. 1880.

varieties of false criticism—no slight merit in the case of so juvenile a production as this, which Warburton was certainly mistaken in terming the work of an author under twenty, but which, on the other hand, it is hardly generous of Mr. Elwin to describe as "representing the capacity of Pope at twenty-three." We notice, by the way, that Mr. Stephen cites the observation, illustrative of the poverty of rhymes in this poem, that it makes ten rhymes to "wit" and twelve to "sense." If there were a Pope Society in existence, we wish some junior member would take the trouble to count the rhymes to "mind" in the *Essay on Man*. To a poem of a very different stamp, which, like Mr. Elwin, Mr. Stephen has not failed to praise, that passion-flower of hot-house growth, *Eloisa to Abelard* he has, we think, done injustice in overlooking its essentially dramatic conception, which rendered the production of such an effect as that which the critic misses—"a disposition to cry"—less easy than it is in the case of a lyrical poem by Cowper or Wordsworth. It may be admitted, however, that real power of dramatic treatment, such as Pope was wholly without, would have created a very different effect. The *Rape of the Lock* Mr. Stephen, as it seems to us, criticizes with a very just appreciation of "the admirable beauty and brilliance" of a poem which in M. Taine's eyes fails to stamp its author even as a *poète de boudoir*, and only helps to establish our national incapacity for true gaiety. On one blemish, however, which appears with even greater distinctness in some of Pope's later writings, the French and the English critic are very justly at one. The unpleasant undertone in Pope's raillery of women is recognizable already in this charming trifle; but it must at the same time be allowed that the Maids of Honour at Hampton Court, who may be supposed to have suggested to the author of the *Rape of the Lock* his notions of the ethics prevalent among "nymphs" of quality, have not been vindicated from the aspersions of his satire by the revelations of their own correspondence.

Of Pope's more important works Mr. Stephen's judgment seems to us likewise in general just. He enters into an unexpectedly lengthy disquisition on that well-worn topic, the merits and shortcomings of Pope's *Homer*, turning the tables with much dialectical skill on those who think that all has been said when a translation which was good enough for our grandfathers and grandmothers has been damned as too artificial for our better-informed generation. He has the courage, which we notice to be rare in these days, to aver that he reads the *Dunciad* with pleasure; yet he misses, we venture to think, the real spirit of the poem when he remarks that, to reconcile us to such laughter as the *Dunciad's*, "it should have a more genial tone than Pope could find in his nature." The real flaw in this satire seems to us the operation, though less intense than in the *Moral Essays* and *Imitations of Horace*, of personal motives which at times misdirector falsify the satirist's indignation. But the main stream of that indignation has a source most deep and pure; nor was the contest waged by Pope one which could end, actually or metaphorically, in a shaking of hands. Even Dryden's wrath as a satirist, who was essentially a partisan, had more of manufacture in it than Pope's, which may almost be said to have at the same time sustained and consumed him. We are surprised to find Mr. Stephen accord to the Fourth Book in particular praise so remarkably scant. Is it not, with all the exceptions which may be justly taken to particular passages in it, a glorious onslaught upon pretentious Philistinism, more particularly of the type which on occasion wears "broad hats, and hoods, and caps"? and was not this perhaps the reason why Gray, to whom the University life of his times was at once irresistible and intolerable, expressed so cordial an admiration of this part of the poem? In discussing the remaining works of Pope's maturity, Mr. Stephen appears to us altogether at his best. Of the *Essay on Man* he observes with cruel downrightness that "the best passages are those in which the author is frankly pantheistic"—an encomium which Pope, whose liberalism undoubtedly had its limits, would have received with considerable astonishment and displeasure. The poet's real masterpieces, however, because most thoroughly in harmony with his genius, were the *Epistles and Satires*. These (or the cream of them) have not unfrequently, perhaps because of the diversity of their themes, been treated with insufficient care in estimates of Pope's prolix labours. Mr. Stephen suggests the true nature of their excellence when he describes them as the pith and essence of their author's own circle of friends and acquaintances, "concentrated into the smallest possible space with the infinite dexterity of a thoroughly trained hand." The exquisite art implied in such a concentration differs of course as widely as possible from a mere process of faithful reproduction. This is pointed out by Mr. Stephen, as it has been pointed out before him by a brilliant man of letters who for many generations remained the acknowledged master among our dramatists in the composition of comic dialogue. "I believe," writes Congreve, "if a Poet should steal a Dialogue of any length, from the Extempore Discourse of the two wittiest Men upon Earth, he would find the Scene but coldly received by the Town."

There are, we should in conclusion remark, certain indications of something like haste in this volume, which allow us to indulge the hope that its author may not yet have said his last word on its subject. "Elkanah Shadwell" (p. 121) is of course merely the birth of an accident, though certainly a passing strange prodigy of the bicipitous sort. The quotations are by no means frequent; yet one of them occurs twice over (pp. 98 and 188), and on the second occasion is accompanied by a comment to some extent paralysing the effect of that offered on the former. There are other repetitions which it is unnecessary to dwell upon, but which suggest that the wearisome labour expended by Mr. Stephen upon his lucid summary of the Correspondence mysteries laid bare in Mr. Elwin's edition left him no time for retouching those parts of his biographical essay which really possess a far more enduring interest. The truth is that there is enough, and more than enough, in these scandals, now brought home irrefutably, to spoil the taste of any Life of Pope for writer as well as reader. Mr. Stephen has too much good taste and too high a sense of justice to surrender himself to a feeling of disgust; but we are not sure whether it is altogether the fault of the subject that his treatment of it is unlikely to take away the unsatisfied feeling left by previous biographers.

SIX LIFE STUDIES OF FAMOUS WOMEN.*

THE author of *Kitty* could hardly write anything dull, but in this volume she has produced some very hasty and uneven work. Her "Famous Women" are selected on no particular plan, and one or two of them have no claim to be called famous. The collection is neither arranged chronologically nor does it represent one epoch; for we have good Mrs. Elizabeth Carter presenting her eighteenth-century countenance between those of Mme. Pape-Carpantier and Miss Matilda Betham—a single old-world figure among a group of moderns. As to the execution of the book, it is hardly worthy of a practised writer like Miss Betham-Edwards. Constant slips of style, repetitions, misprints, make us wish that the author had handed over her copy to some friendly Charles Lamb, whom his sister Mary describes, in a letter here printed, as "often known to spy out errors in a manuscript which has passed through many judicious hands." The sketches are of varying degrees of merit; that of Fernan Caballero is the worst, that of Caroline Herschel is the best; Miss Betham-Edwards being, like many another woman—and man—of letters, better able to describe life than to talk about literature. Still even in the account of Caroline Herschel and Alexandrine Tinné there is neither much subtlety nor much force. "My labours," says the writer, "will be amply rewarded if the present volume finds favour with the young." This it may very well do. It is just the plain straightforward kind of storytelling that young people like; but it cannot claim any higher merit.

The first paper is an account of Fernan Caballero; and it is on this, we infer from the advertisements, that the writer thinks the attractiveness of her book will mainly depend. Unfortunately it cannot be called anything but a very thin and poor description of the famous Spaniard; it is not to be compared, for example, with the excellent article which appeared some fifteen years ago in the *North British Review*. There is no real knowledge of her novels, no translation, no criticism of her characters—nothing but a *résumé* of what Lady Herbert and M. de Mazade have said before. Fernan Caballero is not one of the greatest of writers, but she is a very interesting one, and one who well deserves a careful and sympathetic biography. At present none exists, not even (we believe) in Spain, and Miss Betham-Edwards has contributed little towards supplying the want. When we pass to the notice of Alexandrine Tinné we come to ground on which the writer treads more firmly, and to a subject with which her facile pen is better able to deal. There is no woman of our day whose life has been richer in romantic incident or whose death has possessed a more tragic interest. That a young, wealthy, and beautiful girl should give herself up deliberately to African travel is of itself an astonishing thing; that she should carry out her resolution as Miss Tinné did, with the constant purpose of bringing light to bear upon "the habitations of cruelty," is heroic. As a mere traveller she almost rivalled Speke and Cameron; and there is a fascination in her story, in the passionate devotion she inspired in those who formed her escort, that belongs to her alone. She was murdered by two treacherous Touareg chiefs in Fezzan, south of Tripoli, in March 1869, in the thirtieth year of her age:—

> A few days after her departure the murderous scheme was put into execution. Early in the morning a quarrel broke out—as it is supposed, intentionally—among the camel-drivers, and, hearing the noise, the young mistress of the caravan hastily quitted her tent to see what she could do in the way of pacification. Her appearance was the signal agreed upon for the massacre. One Touareg first disabled her right hand by a sabre-thrust, in order to prevent her from using her revolver; then, with a rifle-ball in the breast, achieved his deadly work. The others rushed on to the slaughter. The three Dutch sailors, her sole European attendants, were next assassinated, and then the plundering of the rich caravan began. The faithful negroes, who adored their kind young mistress, were carried off with the spoil, and the bodies of the victims left unburied on the sands. Thus perished, in the flower of her youth, one of the most enterprising lady travellers, and one of the most courageous women who ever lived.

Miss Betham-Edwards, in writing her account of Caroline Herschel, had little to do except to follow the memoir published a few years back by Mrs. John Herschel; and, with this for her guide, she has given a clear and interesting picture of a woman who ought not to be forgotten. Caroline Herschel was born at Hanover in 1750, the daughter of a musician, who taught his sons music but thought his daughters properly employed in "the drudgery of the scullery." In 1772 she joined her brother William at Bath, where he had

* *Six Life Studies of Famous Women.* By M. Betham-Edwards, Author of "Kitty," &c. With Six Portraits engraved on Steel. London: Griffith & Farran. 1880.

already become famous as a teacher of music, and she at once began that career of devotion to his interests which made his astronomical achievements possible. He ground his own mirrors for the telescope; for, as Miss Edwards quotes from Lord Rosse, such grinding used always to be done by hand, and the work required the very greatest care and industry. "Upon one occasion, whilst engaged upon a seven-foot mirror, he did not remove his hands from it for sixteen hours together." Meanwhile Caroline read to him from Sterne or Fielding, and from time to time actually "kept him alive by putting the victuals by bits into his mouth." Little by little the famous music-master began to make himself known as a man of science. In 1781 he was elected F.R.S., then he was appointed "Royal Astronomer" (not Astronomer-Royal), with a salary of 200*l.* a year, and on this the brother and sister left Bath and the musical profession behind for ever. They settled at Datchet, near Windsor, and Caroline, not without some regrets (for she was in a fair way to become distinguished as a public singer), became assistant to William Herschel, her special business being "to sweep for comets." But the old housewifely instincts were by no means obliterated, as will appear from such extracts from her diary as this, written at their new house at Slough in 1786:—

July 3.—My Brothers William and Alexander left Slough to begin their journey to Germany. By way of not suffering too much by sadness, I began with bustling work. I cleaned all the brass-work for the seven- and ten-foot telescopes, and put curtains before the shelves to prevent the dust from settling upon them again.

July 4.—I cleaned and put the polishing room in order, and made the gardener clear the work-yard, put everything in safety, and mend the fences.

6th.—I put all the philosophical letters in order, and the collection of each year in a separate cover.

18.—I spent the whole day in ruling paper for the register, except that at breakfast I cut out ruffles for shirts. I tried to "sweep," but it was cloudy, and the moon rose at half-past ten.

19.—In the evening "swept" from eleven till one.

For years and years she went on with this nightly "sweeping," although in 1788 her brother married, and she removed to lonely lodgings near by. The work she achieved was something enormous; it is to be explained by the fact that till William died in 1822—her seventy-second year—she went steadily on without check or hindrance, "calculating and copying," watching and recording. Then after that date, when she had already lived to a ripe age and achieved results enough for three lifetimes, she settled down for another quarter of a century in her Hanoverian home. But on this evening of her days we need not dwell; nor indeed need we dwell at greater length upon her earlier time, for Mrs. John Herschel's Memoir must be still fresh in the recollection of many readers.

The sketch of Mme. Pape-Carpantier is fairly interesting; but it does not show any real knowledge of educational questions, or of the history of what has been done and written in reference to them during the last half century. Madame Pape did a considerable work for education in France, and it would be useful to know exactly in what it consisted, and how she was influenced by Fröbel and Pestalozzi and others. But this is just what we fail to find in Miss Edwards's pages. Again it is doubtful whether the dull figure of the pious Elizabeth Carter was worth reviving, except indeed to give one more instance of the incurable provincialism in which the life of the English middle classes is steeped. Compare with this estimable clergyman's daughter, this phœnix of a dull age, submitting her *Epictetus* to the censorship of Bishop Secker, such a figure as that of the "learned lady of the sixteenth century," Olympia Morata, whom Mr. Creighton has lately sketched so pleasantly for us. In the Englishwoman, admirably as she did her work and carefully as she fulfilled her round of daily duties, we miss the sweet sympathetic charm, the breath of sentiment and seriousness, that comes to us from the Italian. Olympia and her sisters are what Elizabeth Carter and her sisters are not, in immediate contact with the main stream, with the great currents on which the spiritual life of Europe still depends. Nor does the fame of Miss Carter gain by the writer's treatment of it. The sketch is done in the very slightest way, being a mere recast of one single book—her life, written by her nephew Montague Pennington—with an occasional criticism interspersed from Mr. George Long or other authorities. And why is Miss Betham-Edwards so careless of small inaccuracies that even her explanatory notes are sometimes worse than no explanation at all? Somebody compared Elizabeth Carter with "the Sulpitias of the ancients and the Schurmans and Daciers of the moderns"; on which the note is as follows:—

Sulpitia, Latin poetess in the time of Tiberias.
Schurman, Anna Maria, German scholar, died 1678.
Dacier, Anne, Greek scholar, died 1720.

Sulpicia, as a matter of fact, lived under Domitian, and was praised by Martial; and Anna Maria van Schurman was in no sense a "German scholar," but a Dutchwoman who wrote in Hebrew, Greek, Latin, and French. Such instances of carelessness show that Miss Edwards has not that proper regard for her audience which an audience has the right to demand, and which is, after all, an author's best safeguard.

The paper on the writer's aunt and godmother, Matilda Betham, "the friend of Charles and Mary Lamb," is interesting on account of the letters from the Lambs, the Coleridges, and Southey which are printed in it. These are not only worth reading, but are of themselves enough to make a demand for the book in which they appear—though, by the way, Miss Edwards does not state which of them are here printed for the first time. Book-lovers will be shocked to hear that Lamb, who has written so beautifully of the joys of book-hunting, should have committed sacrilege in order to decorate a garret. "My brother and I almost covered the walls with prints, for which purpose he cut out every print from every book in his old library, coming in every now and then to ask my leave to strip a fresh poor author." So writes Mary Lamb from the Temple. Imagine frontispieces by Hollar and Marshall and Faithorne coming to such base uses! Let us hope that Lamb felt himself properly punished when he wrote as follows to Matilda Betham, anticipating the thought and the exact expressions of his celebrated sonnet on "Work":—

No one can tell how ill I am, because it does not come out to the exterior of my face, but lies in my skull deep and invisible. I wish I was leprous, and black jaundiced skin-over, and that all was as well within as my cursed looks. You must not think me worse than I am. I am determined not to be overset, but to give up business rather, and get 'em to allow me a trifle for services past. Oh, that I had been a shoemaker, or a baker, or a man of large independent fortune. Oh, darling laziness! heaven of Epicurus! Saint's Everlasting Rest! that I could drink vast potations of thee thro' unmeasured Eternity—Otium *cum* vel *sine* dignitate. Scandalous, dishonourable, any kind of *repose*. I stand not upon the *dignified sort*. Accursed, damned desks, trade, commerce, business. Inventions of that old original busybody, brain-working Satan—Sabbathless, restless Satan A curse relieves; do you ever try it?

We may conclude with a quotation from an interesting letter from Southey containing this estimate of Wordsworth's "Convention of Cintra":—

I entreat you, read Wordsworth's pamphlet upon the affairs of Spain, just published by Longman. Only Burke equals it in eloquence, and he only by fits and flashes; but there shines through this the light of truth and of nature and of God, a light of which nothing more than the dim, discoloured reflection ever shone upon Burke.

DAVID ARMSTRONG.*

THE clever author of *David Armstrong* has sought the materials for a powerfully dramatic story in the natural incidents of humble life. Moreover, there is in it a somewhat remarkable respect for the much-neglected "unities," so far as consistency of situations and circumstances is concerned. Among all the characters, with the exception of one or two who merely flit across the pages, there is not one who makes any pretence to the position of what is conventionally termed lady or gentleman. Even the villain of the tale who works mischief which he cannot repair, though he has played the parts of haughty aristocrats, is nothing more than a provincial actor. Yet in the shifting vicissitudes of strong human action we do not miss those contrasts of rank to which we are habituated in ordinary novels. And within what seems at first sight to be a very limited range, the author has shown no little versatility. His story has its full share of melancholy, and he asks us to sympathize with the endurance of the poor under the galling burdens of cares and sorrows. He dwells on the courage and virtues of unpretending persons, who are unconscious of the heroism that is become a habit of their lives; as he also expatiates on their vices and follies and the temptations by which they are beset. He throws himself into the everyday life of the working-man, with a knowledge which implies intimate acquaintance with it. He writes of religion and its influences as one who has experienced them in their reality; while, on the other hand, he paints the eccentricities of sincere fanaticism with a humour which is never irreverent or even flippant. By way of relief from the overwrought excitement of revival meetings where emotional feelings have broken loose from control, he carries us away to the lighter atmosphere of the theatre, to assist at the triumph of a fascinating *débutante*. In fact, he passes easily and naturally from grave to gay, though the grave undoubtedly much preponderates; and, if his inclinations tend rather towards the pathetic vein, he is alive to the more cheerful aspects of things, even upon the most solemn occasions. Thus we have the hero persuaded by his mother—who is a pious, but narrow-minded old lady—to accompany her and a young female friend to a "love-feast." It is a meeting of the godly of one of the straiter sects, held for the common benefit and improvement, in a bare upper chamber. Men and women who, in passing from darkness into the light, have gone through a variety of personal experiences, get up to relate them. David Armstrong has the shadow of a dark remorse upon him, and is in no mood to be merry nor much disposed to smile. So far as he is not abstracted and indifferent, he has some vague hope that he may possibly be helped to get rid of the load that is inexorably weighing on him. Yet, while impressed by the earnestness of the speakers and even envious of it, it is the ludicrous side of their confessions that chiefly strikes him. There is more of comedy than anything else "when a little tailor, who had no other fame nor possibility of acquiring any (than that of making the worst fit in the town), finished up his lengthy speech with an earnest aspiration:—

Make me little and unknown,
Heard and prized by God alone—

as though the foes he had to contend with on earth were fame and ambition." Again Armstrong's gravity is upset when

* *David Armstrong; or, Before the Dawn.* William Blackwood & Son. 1880.

an elderly woman in a filthy dress and battered headgear gets up to claim the congratulations of the community, as showing the fruits of her reformation for the last few months by living "the life of a spotless and sinless angel." And, having relapsed into gloom, ere long he is half smiling as he listens to a penitent, who had been the greatest scamp in the neighbourhood, telling of the struggle after he had been "made a new man," as to whether he was bound to divorce himself from the fiddle that had been a snare to him. It seems that he had finally solved the difficulty on the strength of a happy inspiration; and, deciding that the fiddle might be made a new creature like its master, had "varnished it thickly till it was fine and shiny. And now, thank the Lord, there could be no harm in it, because it stands to reason that the natur' of the thing has completely changed; and instead of the wicked dancing tunes he used to play on it, it was never heard now, save in the songs of Zion." All this, as we have said, though laughable enough, is related without the slightest irreverence, and, indeed, is introduced with perfect good taste. The humour of the scene is greatly heightened by the fact that the sympathies of the assembled congregation are in solemn harmony with those who stand up to make their confessions, and that there is not the faintest reflection of Armstrong's gleams of mirth in the grave faces of the people about him.

As for David himself, with his vast reserves of strength, mental and physical, he is a rugged but imposing character. Morally he stands out conspicuously from among his fellows, as his big frame towers above them in its stalwart proportions. Inclined to extremes in everything, in the exuberance of his vigour he is no saint, though sometimes he half resolves to become one. His austere upbringing, although it has made his conscience almost morbidly sensitive, may as probably work in him for evil as for good. When we meet him first, he is repenting the evening's debauch; and he has disappointments that tend to embitter him and make him reckless. He has shrewd intelligence and the genius of invention; he has ambitions, and the consciousness of the power of elevating himself. With patient thought he has devised a machine for economizing labour, which has been approved and adopted by the firm who employ him. Of course it excites the anger of his fellow-workmen, and their malice wrecks it when its success has been demonstrated. Armstrong, who has answered for their straightforward dealing, leaves the shipbuilding yard in disgust; accepts a situation as mechanist to a theatre, and is bent apparently on going straight to ruin. At the very turning-point of his career he is so far saved by an accident. He makes himself the guardian of a destitute little girl, who is cast upon his charity by the death of a relative. The child clings from the first to her benefactor, and insinuates herself into his deepest affections. With her warm-hearted impulses and wheedling ways, the little Deeta becomes his delight and tyrant, and the oddly-assorted pair make a series of pretty pictures. As Deeta grows into a woman, under Armstrong's and his mother's care, the nature of his feelings for her undergoes a change. Yet even when she has given her heart to a young musician of her own age, while her filial attachment to Armstrong is as strong as ever, the jealousy which he tries manfully to combat can scarcely be said to come with a revelation to him. It is true that he seeks relief in absence; but he persuades himself that it is merely because he cannot endure the prospect of being the second in a daughter's affections. Nor is it only Armstrong's heart that has been sorely tried by his adoption of Deeta. By an act of which she was indirectly, though most innocently, the cause, she had nearly brought his soul to utter shipwreck. And here one of the most critical phases in the transitions of his spiritual state is wrought out with great truth and force. Indifferent, rather than positively sceptical, he had attended one of those revival meetings which were stirring at the time the irreligion of Oldboro'. The straightforward eloquence of one of the preachers had struck home to him; and allured by the glory of becoming a leader in the Church militant, he had devoted himself with all the energy of his nature to this new service. He goes forth from the meeting burning with ardour, strong in his self-assurance and his new-born spiritual pride, to be brought face to face with a temptation almost irresistible to a man of his passions. He meets Montressor the actor, to learn from his lips that he is the villain who had ruined the mother of little Deeta, and against whom Armstrong in his unregenerated state had vowed undying vengeance. Montressor by his cynicism and offensive behaviour invites his fate. Armstrong, who has listened with unwonted patience, is provoked beyond power of self-control by a blow, which he promptly returns with fatal consequences. For a day or so he stands under the shadow of the gallows; but he is acquitted of murder on proof of provocation, and on the medical evidence as to his victim's state of health. Yet, though pronounced legally guiltless, he cannot forgive himself; and, in the revulsion of feeling from his spiritual self-confidence, he thenceforward grows more gloomy and misanthropical than ever. Still it is characteristic of the man, that though he almost ceases to believe and to hope, he does not neglect the duties and interests that in different circumstances have engrossed his attention. With infinite pains and labour he works out a railway brake which should bring honour and profit to the inventor, while conferring great benefits on mankind. But the knowledge that he has at last attained to success only comes to him on his deathbed. Feeling more indifferent to life than is usual with him, after having parted in bitter displeasure from Deeta, in consequence of a reckless escapade of that young lady's, he has sacrificed himself to save the sufferers who have been buried under a falling house. And the closing scene is extremely touching, as the strong man lies on his deathbed, crushed and mangled, surrounded by a group of mourners who have good cause to regret him.

As a foil to the stern and sterling Armstrong, Deeta is brought in with excellent effect. Though, for the most part, she shows something of the soulless graces of an Undine, she is nevertheless susceptible to passionate feeling, and she is invariably so winning and wayward that we can understand the fascination she exercises. There is an admirable *tableau* which shows her at her brightest by contrast with the grim austerity of David's worthy mother, when the old lady surprises the girl practising for the part of Ophelia in the solitude of her bedroom. Deeta has set her heart upon going on the stage, while Mrs. Armstrong regards stage plays as the foulest devices of Satan. The author's interpretation of Deeta's innocent idea of the part is exceedingly clever:—

> A more ridiculous representation of poor, frenzied Ophelia was never seen than this little maid, as, in the words of Laertes, "Thought, affliction, passion, hell itself, she turned to favour and to prettiness."
>
> The happy, dancing eyes, smiling at themselves; the rosy colour; above all, the utter absence of passion in the voice; the unconscious chastity which prevented her changing colour at the words which meant nothing to her; finding no echo in a nature where the woman had not yet awakened—all these made up one of the strangest, sanest, prettiest travesties of the poet's ideal that it was possible to see.

There are several other excellent studies. Paul Watson, the careworn working-man, Armstrong's closest friend; Hannah, Watson's daughter, who, amidst her premature anxieties and the round of duties she conscientiously discharges, finds time to form a hopeless attachment for Armstrong; and Kit, the deformed and half-idiotic boy whom Armstrong has saved at the cost of his own life, are each and all admirable in their way. And in keeping with the turmoil of rough, hard-working life are the pictures of the town and neighbourhood of Oldboro', where industry has been defacing the beauties of art and nature, and which we take to be photographed from Newcastle-on-Tyne.

MINOR NOTICES.

THE sixth volume of the Manchester Literary Club's Papers (1) is full of subjects of interest of a varied kind. In the table of contents we find such headings as, to choose at random, "Special Collections of Books in Lancashire and Cheshire," "Annals of the English Gipsies under the Tudors," "Fancies and Fashions in Art," "In Robin Hood's Country," and "Thackeray; the Humourist as Preacher." In the last-named paper Mr. John Mortimer writes with a pleasant enthusiasm against the notion that Thackeray was a cynic. In this notion there is no doubt a great want of perception; but so there is, it must be admitted, in Mr. Mortimer's statement that Thackeray "had the intellect of a man and the heart of a child." If either of these suppositions were completely true, Thackeray's best work could never have been produced. His character, although of a far higher moral stamp than that of the French poet, seems to have been not unlike Alfred de Musset's in its mixture of bitterness and softness. This, at least, is the impression which remains with us after repeated reading of his books—an impression far removed from that given in Mr. Trollope's biography, to which Mr. Mortimer has trusted too implicitly. Mr. Mortimer's essay, however, contains many good bits of observation, and, granting its writer's point of view, is well contrived throughout. Most readers of Thackeray will agree with him when he says that "Thackeray had a keen eye for natural beauty, and, when he does describe, displays the hand of a master"—a statement which Mr. Mortimer supports by a well-chosen extract from *Esmond*. This essay is not inappropriately followed by one on "Wit and Humour," by Mr. Anderson O'Conor, one of whose prefatory remarks seems to us worth quoting for its point and terseness:—"We may describe humour as the mood or disposition that gives a mirthful character to wit. There are many antithetical maxims and proverbs that have the quality of wit, and yet are in themselves destitute of humour. Let them only come into the tropical sunshine of a humorous disposition, and they at once blossom into laughter." The writer goes on to illustrate his proposition by various instances, some of which, it should be noted, are curiously misquoted. From some of them, which, to us at least, are unhackneyed and ingenious, we select one which relates how a certain Scotch vassal was condemned to the gallows by his lord. When he arrived at the place of execution, he showed a natural unwillingness to mount the ladder, upon which his wife turned to him reprovingly with "Hoot awa, Donald! Gang up like a man and please the laird." Another essay, on "Charles Dickens and Rochester," gains an additional interest from its carefully designed and executed illustrations; and another, on "Lancashire Dramatic Authors," by Mr. Callender, is full of curious information which will be new to many students of the stage.

The interesting and valuable little volume which Sir Henry Thompson has issued, under the title of *Food and Feeding* (2), contains the substance of two articles which appeared in the *Nineteenth Century*, and were noticed in these columns, improved

(1) *Papers of the Manchester Literary Club.* Vol. VI. With Illustrations. Manchester and London: Published for the Club by Heywood & Son.

(2) *Food and Feeding.* By Sir Henry Thompson, F.R.C.S., &c. London: Warne & Co.

by the author's revision and the addition of an appendix devoted to the *Pot-au-Feu*, an institution too little known and respected in England. To our former remarks on Sir Henry Thompson's articles we need only add that their appearance in a volume form is acceptable, and that we are not surprised at "the wide demand for their republication" spoken of in the few words of preface.

The title of Mr. Forbes's volume (3) is, to "speak by the card," incorrect. The sketches which it contains are of things which he has observed in the intervals of his campaigning life, and they describe to us with much vividness all kinds of experiences through which the author has gone, ranging from a visit to the King of Burmah to a Christmas Day spent in driving a four-wheeled cab. "Almost all," we learn from the preface, "are reprints," and it may be added that almost all have some portion of interest or amusement. Mr. Forbes's writing has many vices of style, but it has the merit of always impressing you with a sense of reality. The manner is too often flashy, but there is generally something worthy of note underlying it. The book is one which may be safely recommended for desultory reading, and among its contents we would call special attention to a chapter headed "An Evening Party among the Navvies."

Since the days of *The Rovers* nothing quite resembling *The Sacrifice* (4) has appeared. Before such a work criticism is of necessity dumb. At the risk of tediousness we must venture on quotation. The curtain rises on an interview between John and Sarah, servants at Richmond Hall. "You've been," says John,

> An honoured and superior servant, living
> Before all eyes a pure and Christian life,
> Yet of yourself you speak as if
> You were the very source of discord, grief,
> And all that's ill.
> *Sarah.* When one's tongue
> Condemns one's life, it seeks for flattery,
> Yet knows it speaks the truth—I must insist
> You'll speak no more of this.—They come. [*Exit R.*

Another scene shows us a room at Mrs. Cheetham's, occupied by Mrs. Cheetham and her son. As the curtain rises the son says,

> Would you would die a natural death!

To which the mother not unnaturally replies,

> O cruel ingratitude!
> *Cheetham.* Ingratitude!
> You've trained me up a spoiled and self-willed child,
> Deprived me of my birthright wilfully;
> There's nothing to be grateful for in that.
> *Mrs. C.* My boy! My darling boy! You'll break my heart.
> *Cheetham.* You know I've never liked you, mother, and
> Since I've known all I've cursed you in my heart.

The plot of this marvellous drama is, if possible, more exquisite than its dialogue.

Messrs. Kegan Paul and Co. have issued an admirably got-up edition of *The Princess* (5), printed on the rough paper which is dear to many book-lovers, and bound in white vellum.

Mr. Adams, whose books of schoolboy life are probably familiar to many of our readers, has now ventured on the more difficult ground of University life (6), and may on the whole be congratulated upon his success. Many writers have tried their hand at dealing with this subject under the guise of fiction, and few have succeeded. Several books of insight and merit which are cast in the form of essays on University life, whether of Oxford or Cambridge, will occur to the mind; but the *nouvelle* or novel of University life has not been either frequent or, as a rule, successful. *Tom Brown at Oxford* and *Julian Home* are the standing instances for each University of undergraduate novels. With each many faults might be found, and have been found; and in one respect, that of giving a really accurate picture of certain phases of undergraduate life, a novel by Mr. Tottenham, of which we cannot recall the exact title, dealing with Cambridge, was superior to both the books just mentioned. Mr. Adams's *College Days* does not aim at being more than a *nouvelle*, and it may be said to fulfil the requirements which might fairly be expected from it. It shows us, of course, the virtuous reading undergraduate, the villanous and would-be fast undergraduate, the lordly, apolaustic, and haughty undergraduate, the clever and somewhat idle undergraduate, and, as the hero of the book, the well-intentioned and accomplished, but vacillating undergraduate, who goes through various trials brought upon him by his own folly, and at the end comes out of them triumphantly. The characters are sketched with some spirit, and the writing is pleasant. In almost every book of the kind there is a villain whose evil dispositions and contrivances are more likely to be met with in a rattling melodrama than in every-day life at Oxford or Cambridge; and the most that can be said perhaps for Mr. Adams's Oxford villain is that he is more plausible than the Cambridge villain of *Julian Home*. On other grounds it would be unfair to compare Mr. Adams's book with *Julian Home*; for, on the whole, it is a healthy enough sketch of undergraduate life, undisfigured by morbid sentimentality or outrageous nonsense. Some of the incidents are naturally out of date, a fact which the author recognizes in his foot-notes; but the "Row in the Theatre" is, it is to be feared, as true to the present as to a past day.

A handsome volume, adorned with some capital illustrations, and issued by Messrs. Cassell and Co., gives much interesting information as to important parts of the country of which travelling English people are apt to know least—their own (7). The book opens with a careful and accurate account of Chester, a place which has suffered a good deal in the general estimation of its beauty from the unwise comparison constantly made between it and Bern. The chapter devoted to it contains a striking story, which might suggest a subject for versification to Mr. Bret Harte, of an engine-driver whose train, not his engine, was thrown into the Dee by the bursting of one of the outer girders of the railway bridge. "He hastened on to the next station and gave the alarm, then, shunting on to the up-line and reversing his engine, he dashed back over the pair of girders which yet remained standing, in order to give an alarm at Chester station." The chapter on Cambridge is well done, and is written with knowledge, and it may be said of the whole book that it is attractive and full of information.

The sixth number of the series called *The Hundred Greatest Men* (8), which on its first appearance we noticed at length, includes under the head "History" Herodotus, Thucydides, Demosthenes, Cicero, Tacitus, Plutarch, Montaigne, Montesquieu, Voltaire, Diderot, Lessing, and Gibbon. This odd medley is graced with an introduction by the Dean of Westminster, written in his accustomed manner.

A fifth edition has been issued of Mr. Colquhoun's admirable work called *The Moor and the Loch* (9). The fact that it has reached a fifth edition is in itself a valuable tribute to the merit of the book, which on a previous occasion has been treated of at length in these columns.

Although there is nothing in *The Art of Washing* (10) that most people have not known, though perhaps not seriously thought of before, excepting the substitution of a "Loof" instead of flannel for personal washing; yet the subject, a most important one, is placed before the public in an attractive, concise, and useful form, and it would be well if it could be generally studied. The first part contains full directions on personal washing, the second on clothes-washing, the third on house-washing. "Clothes-washing" has most valuable hints in its pages, and winds up with this quotation from "a learned and eminent preacher":—"Look at the vast evil of small laundries. What disease is there fomented! clothes not disinfected, mixed up before and after washing! Remedy—abolish all small laundries, establish in each district proper public laundries under due supervision with disinfecting rooms and drying grounds. A company might make its fortune in five years, especially if it undertook not to destroy more than five per cent. of the garments intrusted to its care." If the third part of this little book were learnt by heart by householders, and put into practice, there would be far less fever and diphtheria in England than there is now.

The Oxford Press has issued for the Sunday School Centenary Celebration two beautiful editions of the *Oxford Bible for Teachers* (11), one of which is described as "the smallest edition in the world."

For the same occasion Messrs. Eyre and Spottiswoode have produced an admirable edition, which combines the Reference Bible with their Variorum Bible and with the Aids to the Student of the Holy Bible contained in their Bible for Bible Teachers (12).

The tragic death of the Prince Imperial is still so fresh in our memory, and the interest he excited in every one, whether friend or foe, still so vivid, that Miss Barlee's volume (13) will be doubly welcome amongst the literature of the day, as a faithful summing-up of the Prince's life and as a conscientious and well-written account of all the principal events in his short career. The book is full of interesting anecdotes, and also contains good useful reading as to history. Most people think they know well enough the sad history of the last war in France; but the three chapters "Metz," "Sedan," and "Empress Regent" bring it all before us afresh. The account of the Prince's death in Zululand is graphically given; and Miss Barlee has got much valuable information from those friends whom she thanks in her preface for having helped her to compile the volume. Her description of the scenery is vivid, and the book contains some touching and poetical passages.

M. Renan's *Hibbert Lectures* (14) have been issued in a volume form and in the shape of an excellent translation by Mr. Charles Beard. The few words of preface contain a pleasant record of M.

Renan's impressions of his visit to England. It is to be hoped that time may show that his high opinion of England and of her future is well-founded.

A second edition has appeared of Mr. Mann's useful and clearly written little book on Domestic Economy and Household Science (15). Mr. Mann's directions are practical and judicious, and frequently, as in the case of his discourse on the much-vexed question of mistress and servant, he says a good deal that is worth attention in a few words. His chapter or "Lesson" on Economy and Saving is another good instance of his skill in this direction. The little volume is one in which most people who have, or are likely to have, anything to do with household cares will find some hints worth noting.

Mr. Kenny's volume is a reprint of an essay (16) which gained the Yorke prize at Cambridge. The object and scope of the work are plainly set forth by the author in his preface, in which, after directing attention to the importance of the subject, he observes that his materials have been chiefly derived from studying the Blue-books of the last sixty years, a study the laboriousness of which will be appreciated by all who have had the same kind of work to do. With the aid of these stores of undigested information Mr. Kenny has illustrated "the broad theoretical generalities of the subject by the practical details of actual experience." He modestly disclaims all idea of novelty either in his data or deductions, but has aimed at bringing "into one focus evidence which previously lay scattered through a library," an ambition which he may be congratulated on having fulfilled.

Mr. Mac-Alpin's object in compiling his volume on the Law of Money-Lenders and Borrowers (17) (which, by the way, is a somewhat awkward title) has been to deal with the legal risks specially incidental to a usurious contract. Mr. Mac-Alpin asserts that his book must necessarily prove useful to "the class just indicated," which from the context appears to mean persons who get "exorbitant profit" for the temporary use of money, and incur at the same time "compensating risks"; and he is also so kind as to hope that it may be of some use to "unfortunate borrowers who are often tempted into contracts, the legal effect of which they do not understand." It is to be hoped that Mr. Mac-Alpin's efforts will be appreciated.

Mr. Baker's volume on Highways (18) is complete and exhaustive. He has provided in it a succinct code of the laws existing on the subject, and has set out the statutes in an appendix. The volume is likely to be of great service as a book of reference.

A second edition has appeared of Messrs. Greenwood and Martin's valuable and comprehensive *Magisterial and Police Guide* (19), a book which justices of the peace should take care to include in their libraries.

A second edition has appeared of Mr. Tarbuck's treatise on house property (20), which is full of information valuable to householders or persons intending to become householders.

Messrs. Smith and Elder have issued a second series of selections from the works of Mrs. Browning and of Mr. Browning (21, 22). In both cases the selections have been well and carefully made.

The records of the Parish of St. George's-in-the-East (23) which Mr. Hadden has collected are curious and interesting. It is desirable to add that "such profit as this work produces will be given to the Organ Fund of the Parish Church."

THE DISTURBANCE BILL.

THE conduct of the Irish Disturbance Bill has been worthy of its conception. The form of the measure has been changed again and again in the hope of conciliating different classes of opponents, with no result except the proof that a startling innovation had been proposed without any serious examination of the circumstances which purported to justify it, or of the method by which the supposed object was to be attained. At the beginning of the Session nothing of the kind had been contemplated; and, if Mr. O'Connor Power had not brought forward his Bill, Mr. Forster would probably never have borrowed its substance and form. The statistics on which the Government relied may have been accurate, but they were misunderstood, and consequently misrepresented. Lord George Hamilton convicted the Government of having mistaken processes of ejection for actual evictions, and of having attributed to landlords all the decrees of ejectment which had been procured by creditors of all kinds. Mr. Gladstone had further misled the House by the surprising assertion that between three and four thousand policemen had been engaged in protecting process-servers. It was not till the misstatement was exposed that Mr. Gladstone confessed that he had multiplied the real number of police by the number of cases in which they had been engaged. On the same system the number of metropolitan police might be reckoned at 200,000 or 300,000, though the force really consists of 10,000 men. The explanation may perhaps have been an afterthought to excuse a preposterous blunder. Lord G. Hamilton showed that in Donegal, where 180 evictions had been returned, only six tenants were dispossessed for non-payment of rent. Mr. Gladstone and Mr. Forster endeavoured to answer the statement by the assertion that some tenants were for the time only care-takers, liable to expulsion until they had paid their arrears. It is impossible to believe that the Ministers, when they talked about the expulsion of occupiers from their homesteads, only meant to say that they had for the time become tenants at will. The vicious principle of the Bill would probably never have been accepted if Mr. Forster and his colleagues had taken time to study the facts of the [illegible].

It will perhaps never be known whether Mr. Gladstone and Mr. Forster foresaw and defied the alarm and repugnance with which their project has been received by all moderate members of the Liberal party. The all but unanimous opposition or abstention of the Whig aristocracy plainly indicates the uncertainty of the tenure of office by nearly half the members of the Cabinet. Mr. Gladstone probably knows by this time that many of his colleagues utterly disapprove of the Bill to which they have for the present assented. One or two of the capricious changes which have been introduced in the form of clauses were probably intended to satisfy the Whig dissidents; but from first to last the Bill bears the marks of confusion and hurry. The Irish Attorney-General's amendment was probably contrived for the purpose of diminishing the difficulty of landlords in recovering their rent; but it was objectionable as an indirect method of establishing tenant-right in the scheduled districts. Mr. Parnell and his followers, who had naturally voted for a measure plagiarized from a Bill of their own, at once protested against a clause which might in some cases be used for the protection of the landlord. Their hostility seems to have surprised and disappointed Mr. Gladstone and Mr. Forster; and accordingly the extemporaneous amendment of the Attorney-General was as suddenly withdrawn. It was understood that the Home Rule malcontents were for the moment pacified by the concession; but, having pledged the Government to one of the most obnoxious of their own doctrines, they apparently intend not to allow the Bill to pass. In answer to an appeal from Mr. Gibson to confine the provisions of the Bill to tenancies of not more than 15l. a year, Mr. Gladstone consented to place the limit at 30l. It is certain that the prevailing distress affords no reasonable excuse for a suspension of liability to pay rent on the part of a substantial farmer. In the last preceding edition of the Attorney-General's clauses, the rights of the landlord were not to be affected if he offered to the tenant some reasonable alternative. The phrase was probably intended to signify the sale of tenant-right in cases where it was saleable. The imposition of the limit of 30l. at once afforded Mr. Parnell a pretext for opposition. It was, he contended, only in the case of large holdings that there would be anything to sell. His determination to oppose the Bill if he was not bought off by some fresh compromise is more important than his arguments for or against any particular clause. Mr. Forster finds himself in the position of a statesman of the later Roman Empire, engaged in buying off a threatened invasion of the frontier. Goths, Vandals, or Huns, from time to time agree to his price; but their demands are incessantly renewed, since it is found that they have a tangible value. The most troublesome enemies receive the fullest consideration. A not inconsiderable section of the Home Rule party which has throughout supported the Government is consequently denounced by Mr. Parnell as not even deserving the title of Irish members. The Government seems so far to agree in the charge as to assume that Ireland is exclusively represented by obstructives.

The debate which occupied the whole of Wednesday ostensibly turned on the limit of rental to which the measure is to apply; but the digressions into the principle of the Bill were frequent and sometimes instructive. Sir George Campbell's proposal of a virtual suspension of payment of rent up to 50l. was wholly inconsistent with the original scope of the measure. If substantial farmers are to be protected by legislation against the failure of crops, a precedent will have been established for interference between landlords and tenants in other parts of the United Kingdom. The latest illustration of the weakness and vacillation of the Government is the virtual acceptance of the proposal that the limit shall be extended to 50l. It is apparently a matter of indifference to Mr. Gladstone that every concession of the kind may ruin many innocent landowners, not on any reasonable ground of protection to tenants, but solely to relieve the Government from the opposition of an unscrupulous faction. The accident that the change was first proposed by a Scotch amateur shows of itself that it is arbitrary and vexatious. Mr. Parnell with much ingenuity discovered a reason for objecting to any limit, in the alleged encouragement which might, as he suggested, be afforded to landlords who desired to consolidate holdings. He is probably well aware that, if economical [illegible]

siderations exclusively prevailed, the petty tenants would long since have been evicted. The only pretext for the Bill is the supposed inability of small farmers to pay their rent, and the hardships which they might suffer if they were at present evicted. It is true that more responsible legislators than Mr. PARNELL seem to have forgotten the grounds on which the measure was originally proposed. It was not a little remarkable that a member so intimately connected with the Government as Lord EDWARD CAVENDISH should appeal to the PRIME MINISTER to withdraw the Bill. Mr. FORSTER, whose sincerity is never doubtful, expresses regret and surprise at the alarm which has been caused by his well-meant proposal. His failure to foresee the inevitable consequences of the introduction of the Bill is an additional proof of the haste and carelessness with which the Government entered on a dangerous course. It may be doubted whether any Ministry has within three months from the beginning of its first Session so seriously impaired its credit for prudence and moderation. In that time Mr. GLADSTONE has laid the foundation of a fatal schism in the Liberal party, and he has confirmed the distrust which had been caused by his speeches before and during the election. Of all his miscarriages, the most serious is the Disturbance Bill in its various forms and phases, which have given occasion for a series or cluster of blunders.

THE FÊTE OF THE FRENCH REPUBLIC.

THE great French fête has come and gone and has been a complete success. It excited great enthusiasm, it occupied and absorbed the public mind, it gave great satisfaction to those who planned, and great enjoyment to those who watched. Most fortunately the weather was brilliantly fine, sunshine tempered by flying clouds and a light breeze. There was none of that inopportune rain which drenched TALLEYRAND and those whom Mr. CARLYLE calls his two hundred men in calico, when the Feast of Federation was held on the first anniversary of the taking of the Bastille. The great event of the day was the distribution of the new flags to the army by the PRESIDENT, and the march past of the troops that followed. Paris turned out the equivalent of three Derby crowds to witness this striking ceremony, and it may be noted to the credit of the Republican Government that no despotism could have better organized the innumerable details of this prolonged spectacle. Everything happened as it was meant to happen. Every one was in his right place, and got out of the way when he was no longer wanted. President GRÉVY, with M. LÉON SAY on his right and M. GAMBETTA on his left, represented France such as France now is, and the trio went through their task with as much gravity and dignity as could have been displayed by the three great EMPERORS of Europe. Punctuality has long been said to be the politeness of Royalty, and it is pleasant to know that a Republican President can be as punctual as a King. Exactly at 12 o'clock President GRÉVY left Paris, and exactly at half-past he reached Longchamps. In the evening there were illuminations, as Paris alone of cities knows how to manage them. Flags, fountains, clusters and festoons of lamps, combined to dazzle and delight the eye. Notre Dame was lit up by some contrivance, which is somewhat incoherently described as making it look as if it had been made of porcelain and producing a weird impression, and which it may be guessed was not altogether successful, but which at any rate was a curiosity. Every advantage was taken of the peculiar disposition of the city, which admits of many sites being chosen with an almost equally good effect. Montmartre and the Buttes de Chaumont make as good theatres for decoration and illumined shows as the Champs Elysées or the gardens of the Tuileries; and the crowd was kept happy and quiet by having, wherever it might be, a neighbouring centre of gaiety and beauty. But what was most striking in the fête was not the review of the army, although it was a most imposing and brilliant sight; nor the illuminations, although in these Paris—which may be called the mother of illuminations—surpassed herself; it was the ardour of the people to make the fête their own. They seem to have been carried away with the idea that they would show they were not having a fête given them, but were giving it to themselves. They were engaged in paying a solemn tribute, not to a dynasty or a family, but to themselves. The dingier the street, the gayer it was with flags and bunting. The poor spent or borrowed their last farthing to show their gaiety of heart and their pride in the festival of the Republic. Hero-worship never dies out, and something of a personal character was imparted to the spectacle by the exhibition of little wooden effigies of M. GAMBETTA dressed in evening clothes—perhaps the quaintest form of mob idolatry ever devised by man. But there was not very much of M. GAMBETTA, or of any one else, in the festivity. To sing the "Marseillaise" hour after hour, to look at coloured lamps, and to feel that there was a Republic broad as the sky above to guide and bless them, was all that the happy and simple population of Paris seemed to need.

This rejoicing of Republicans in the Republic, not so much as a manifestation of party triumph, but rather as a realization by the people of the Government being its Government, was the great characteristic of the festival. Only secondary to it was what may be termed the wedding of the Republic and the army. Nineteen generals, representing the nineteen army corps of France, stood round General FARRE while President GRÉVY spoke to them words meant for the army and for France. The PRESIDENT has lately so completely effaced himself that it is difficult to remember that he exists; and it is therefore satisfactory to find that on this solitary occasion of his visibly emerging into being, he could say exactly the right thing in exactly the right way. He pointed out that to her army, which is now a really national army, France gives the best part of herself, as she gives it all her youth; while in return she receives back this youth disciplined, fortified, full of patriotism and of the love of duty. France has grudged nothing to the new army, and the army has repaid her prodigal affection by learning to be a real army, an army which guarantees to France the respect due to her and the peace which she means to preserve. The PRESIDENT was only saying what every one knows to be true. The French army has had immense sums spent on it since the German war, is in a high state of discipline and efficiency, and is a really national army. How much the French army has improved in the last few years is known to none better than to the great generals of Germany, and the present military power of France is to them a subject of constant and anxious reflection. The army, too, is no longer a caste apart from the civilian population, but is taken from it, belongs to it, and is again merged in it. What the nation wishes the army will wish, and this is the meaning of an army being called a national army. If the nation gets tired of the Republic, the army will get tired of it too. The German army is quite as much a national army as the French army, and is devoted to its EMPEROR. It believes, because Germans generally believe, in the unity of the Fatherland and the leadership of the HOHENZOLLERNS. And if any army deserves to be called national the English army deserves the name. It, like England, believes in the QUEEN and the reign of law. The difficulty of the French Republic is to continue to commend itself to the nation, and this difficulty is not lessened by the present adherence of the army to the Republic. What the Republic has succeeded in doing is that it has freed itself from the danger of the army being used as the instrument of an adventurer forcing or outrunning public opinion, and wading through slaughter to a throne. This is a great achievement, for the Republic may now hope to escape a violent or accidental end. It will live or die on [illegible] own merits; but, if it seriously offends or alienates the [illegible] it will die, not so much in spite of the army being na[illegible] but for the very reason that the army is national.

As the fourteenth of July is the anniversary, not only of the taking of the Bastille, but of the Feast of Federation, it is only natural that men should compare the feast of Wednesday last with the feast that was celebrated seventy years ago in the Champ de Mars. Then, too, there was unbounded enthusiasm, and then, too, the people made the fête their own; for they by their own hard work and with their barrows and pickaxes made the gigantic amphitheatre from which three hundred thousand spectators watched the proceedings. All was love, concord, and fervent hope. A Bishop—the queerest Bishop perhaps on record, but still a Bishop—gave the blessing, the KING took the oath of fidelity to the new Constitution, the people went mad with delight. But, as things turned out, this happy day was the last of happy days, and was the precursor of terror and tyranny and bloodshed. What has happened once may, it is thought, happen again; and there is an uneasy

feeling that on Wednesday the Republic was too happy not to provoke ill-fortune. No one can say that this uneasiness is altogether unfounded. There are obvious dangers in the way of the Republic. There may be bad days in store for it. If M. GRÉVY is able to thank the army for its fidelity, M. ROCHEFORT is able to thank the Parisians for what he calls "crowding round his humble "cab." Wooden images of some much more objectionable person in evening clothes may replace the effigies of M. GAMBETTA. But it is only with very great limitations that Republican Paris in 1880 can be compared with Republican Paris in 1790. Between the population of Paris as it was seventy years ago and as it is now there are two differences, and they are differences so capital that it is hard to get to the end of the consequences they involve. The present population is not starving, and it has conquered equality. Whatever else the French people may have gained or lost in the last ninety years, it has indisputably gained enormously in material wellbeing. We may be sure that a Republic of comparatively rich men will never behave like a Republic of destitute men. And then equality has been won, and has been won so completely that there is now no fear of inequality. In 1790 the people lived in perpetual terror of their late masters. They saw in everything a plot of aristocrats. They even made the amphitheatre on the Champ de Mars with sudden and feverish activity, because they suspected that the aristocrats were secretly delaying the progress of a great national undertaking. Last Wednesday there was silence and gloom in the Faubourg St. Germain. The great people who live there would not make their streets gay in honour of a festival that was odious to them. But no one took the trouble to be irritated by this refusal to share in the popular gaiety. The aristocrats were simply ignored. If they liked to sulk, they might. They were too harmless, too much out of the stream of real life, to be worth noticing. They have nothing to say which any one wishes to hear, and can do nothing which any one need fear. They are left out of the reckoning just as a girls' school is left out of the reckoning in the intercourse of country society. This is a total and radical change from the state of things in 1790, and whatever else we may choose to prophesy or expect, we may be sure that the peculiar phase of disorder which showed itself as the sequel to the Feast of Federation will not show itself as the sequel of the festival which the present rulers of France have just carried out with such triumphant success.

TURKEY AND THE SIX POWERS.

THE Six Powers have, for reasons of their own, presented to the Porte an identic Note on the subjects of the Montenegrin frontier and the proposed reforms in Asia, and a collective Note on the cession of territory to Greece. Though the distinction is at first sight scarcely appreciable by the lay understanding, a collective Note is, according to diplomatic usage, more urgent than a simultaneous presentation of six copies of the same Note, each separately signed by only one of the remonstrating Governments. Mr. GLADSTONE asserts that Turkey has never yet refused submission to the united demands of Europe; and he infers that the same result will follow from the collective Note. The identic Note, or that part of it which relates to Asia, has received an unexpectedly full and favourable reply. The answer of the Porte contains a sketch of an admirable organization which almost deserves to be called a Constitution. The sole drawback to the scheme is that it only exists on paper, and that it is never likely to assume a more practical shape. There are probably no means of testing the truth of the statement that in some districts of the country which is known as Armenia the Mahomedans form 79 per cent. of the population. It is unofficially known that the Porte has protested against the cession of Janina and of three other places, while no objection is offered to the other territorial changes. Much irritation, which may perhaps be partly factitious, is expressed by the Mahomedan population, and the SULTAN is probably not unwilling to exaggerate the importance of a feeling which coincides with his own. Movements of troops from Constantinople to the provinces are reported; but it is uncertain whether the preparations are directed against the Greeks or the conspirators in Bulgaria and East Roumelia. Any attempt on the part of the Greek forces to occupy the territory assigned to their Government by the Berlin Conference will probably be resisted by the Albanians with the secret countenance of the Turkish authorities. The tribes in another part of the same country have at last engaged in a conflict with the Montenegrins; and both Mussulmans and Catholics will be hostile to the Greeks. An invasion of hilly districts inhabited by warlike tribes would be a rash and doubtful undertaking even if there were not a danger of collision with the Turkish troops. It is highly improbable that the SULTAN will place his forces at the disposal either of the Greek Government or of the Great Powers. The only sign of deference to foreign counsels which has yet been given is the dismissal of OSMAN PASHA from the office of Minister of War. As he is still, however, Marshal of the Palace, he is supposed to retain the confidence of the SULTAN; and it has even been suspected that he may be about to assume a military command.

In any diplomatic discussions which may take place the Turks are likely to have the best of the argument. They can show that the provisions of the Treaty of Berlin in their favour have not been enforced, and that the proposal of a cession of territory to Greece was a simple recommendation. The reasons which influence the English Government, and to a certain extent the other Powers, are of a kind which cannot be explicitly avowed. To the complaint that force has been substituted for the advice which was thought sufficient at the date of the Berlin Treaty, the six Powers can only reply that they expected their mediation to be received with deference, and that they have been disappointed. Their interference in any form can only be justified by their preference of Greek civilization to Mahomedan stagnation; and the Turks can scarcely be expected to recognize their own inferiority as a reason for unequal treatment. It may perhaps be true that the master of many legions may sometimes point to his forces instead of relying on mere argument. The six Powers, or any two of them, are far more than a match for Turkey; but, before legions can be substituted for logic, it is essential to ascertain whether they will be used to support the proposed conclusion. The collective Note, though it is sufficiently peremptory in tone, contains only implied threats and indirect commands. The Porte is well aware that the demand, though it may be jointly preferred, is supported by the signataries of the Note with varying degrees of earnestness. Germany and Austria will not enforce the acceptance of their advice; and it is understood that France would decline an invitation to co-operate with England. The supposed readiness of Russia to send troops to Epirus has excited suspicion and jealousy; and it is difficult to believe that under Mr. GLADSTONE England would engage in an unprovoked war.

Mr. GLADSTONE'S retrospective scheme of imaginary coercion to have been applied to the Porte in 1876 would now be scarcely applicable, even if it might have been adapted to the circumstances of a former time. He has often suggested that, after the Bulgarian disturbances, an English or allied fleet ought to have occupied the narrow seas, with orders to intercept the transit of Turkish troops from the Asiatic to the European shore. He probably assumed that at the same time a Russian army was to invade Bulgaria, with a certainty of success because the Turkish force would have received no sufficient reinforcements. It is not necessary to point out the objections to an anomalous proceeding which was not even publicly proposed at the time, though it may perhaps have existed in Mr. GLADSTONE'S imagination. No such measure would serve the purpose of transferring Janina to Greece. The Albanians and Turks need no aid from Asia to enable them to repel a Greek invasion, though they might be unable to hold their ground against a European army. An English fleet on the coast could exercise no influence over the fortunes of an Albanian campaign, though it might be proper to prevent the Turks from profiting by their great naval superiority to attack or threaten Athens. It might or might not be possible to force the passage of the Dardanelles. In any case the enterprise would be hazardous and uncertain. When the fleet entered the Sea of Marmora in 1877 great anxiety was felt until it was known that the Turkish garrisons had received orders not to oppose the passage of the Straits. It has been lately stated that the forts have been newly armed and victualled, for the obvious purpose, if the report is true, of opposing a movement which would in itself be an act of war. Even if an Eng-

lish fleet were safely anchored off Constantinople, it would find itself practically powerless. It is impossible that it should be employed to bombard the capital, even on greater provocation than the rejection of the advice of the Congress or of the Conference of Berlin. In addition to other reasons for disregarding any such menace, the Turkish Ministers probably know that the English Government is deeply pledged to the maintenance of peace. Even a dull Oriental might be amused at the contrast between a war undertaken by Mr. GLADSTONE and the successful maintenance of peace by Lord BEACONSFIELD in the midst of innumerable difficulties.

The backwardness of the late Government in urging the claims of Greece may perhaps be explained by their possessing a clearer foresight than their successors of the difficulty and risk of the undertaking. If Turkey was not to be coerced into submission, it was less undignified to withhold unpalatable demands than afterwards to acquiesce in a refusal. In consequence of the sudden activity of the present Government there is too much reason to apprehend the alternative of a rupture with Turkey or of a humiliating rebuff. The proposition that the Porte necessarily yields to the combined pressure of Europe is subject to the condition that the Powers are prepared to support their demands by force. Peaceable remonstrances will be equally ineffective whether they proceed from six Powers or from one. The Government is well advised in refusing to furnish Parliament and the world at large with the particulars of incomplete negotiations. Lord BEACONSFIELD and Lord SALISBURY were often abused for a reticence which was said to be disrespectful to Parliament; but it is much better that their assailants should be inconsistent than that they should disregard the responsibilities of office. There may perhaps be an additional reason for silence, if the Ministers have nothing to tell. It is at least possible that they may not have induced France, Austria, Germany, or Italy, to take measures for the enforcement of the Berlin award; and it is nearly certain that they are not disposed to supply the deficiency. The failures of English foreign policy are, notwithstanding the practice of the late Opposition, not a proper subject for exultation. The most welcome solution would be the common action of the Powers, which would probably cause the submission of Turkey without an actual rupture. The extension of Greek territory at the expense of Turkey would be an advantage both to the population which would obtain a somewhat better Government, and to the peace of Europe. Whether it is worth an officious or disinterested war is a more difficult question. It is not unlikely that the matter may be complicated by an insurrection in East Roumelia or Macedonia. A movement tending to the aggrandizement of Russia, and probably directed by Russian agents, would, unless the national feeling has changed greatly in three or four years, produce disapproval and resentment in England. Mr. GLADSTONE might perhaps endanger his popularity with the mob, while he would aggravate and justify the distrust of other classes, by connivance at a diversion which might perhaps be favourable to the cause of Greece. Those who are best acquainted with Eastern Europe attach the greatest importance to the present crisis.

PUBLIC BUSINESS.

ONLY a fortnight of July now remains unexpired, and as Mr. GLADSTONE has announced that he will not think of prolonging the Session into September, or even to the close of August, three weeks are probably all that are to be added to the fortnight of July. Thus Parliament has at the most five weeks more to sit. It is obvious that there is not time for the Government to carry more than a fraction of its measures. At present the only Bill it has distinctly withdrawn is the Irish Borough Franchise Bill. But it must soon make up its mind to throw over other measures. There may probably be no opposition to some of the Government Bills. The Ballot Bill is a mere continuance Bill and cannot be opposed. The Government have three measures in the House of Lords; the Elementary Education Bill, the Scotch Secondary Education Bill, and the Census Bill, which may creep rapidly and quietly through both Houses, although it cannot be taken for granted that any Bill dealing with elementary education will escape prolonged discussion; and the speedy passing of the Scotch Bill must depend on its receiving the silent approval of the Scotch members. The Savings Banks Bill has not yet been read for the second time; but if the clause permitting the increase of deposits is abandoned, the remainder of the Bill might be readily accepted. The Customs and Revenues Bill is to receive important changes in Committee, but it must pass; and Mr. GLADSTONE'S authority on questions of finance is so great, that the shape he chooses to give finally to his measure may be expected to be that which it will assume. The Seamen's Wages Bill is in a very backward state; but it might perhaps be pushed forward if the Government wished it, as it is not likely to excite the kind of opposition which is serious towards the close of the Session. There the list closes of measures which, if an optimist view is taken, might be got through with something like care and expedition. The first thing is to get the two Irish Bills out of the way. They have taken up an enormous amount of the time of the House of Commons already and they promise to take up more. It must be remembered that when the Government fixed its programme for the Session no account was taken of these Irish Bills. The Relief Bill was looked on as a means of giving a bonus to Ireland which Ireland would welcome and which England and Scotland would cheerfully grant. As a mere afterthought, a clause regarding evictions was proposed to be inserted in the Relief Bill as a small additional precaution to be taken against the consequences of distress. As things have turned out, the Relief Bill, even after it has been freed from the encumbrance of the Eviction clause, has not yet got through Committee. The Eviction clause of the Relief Bill has grown into a separate measure, which is found to involve some of the most serious questions that could be submitted to the Legislature. Every day it is presented in a new aspect, and although the Government, if it perseveres, is sure to get it in some form or other through the Commons, still it is impossible as yet to conjecture how much of the five weeks will be exhausted in the process.

Supposing the Irish Bills are done with in the Commons and remitted to the Lords, the following measures will remain to be dealt with in the Lower House—the Burials Bill, the Post-Office Note Bill, the Vaccination Act Amendment Bill, the Hares and Rabbits Bill, and the Employers' Liability Bill. In none of these measures has any progress as yet been made. They all come before the House as practically new measures. The Burials Bill has been passed by the House of Lords; but there may be as much discussion over the amendments introduced by the Lords as over a Bill presented for the first time to the House of Commons. The Post-Office Note Bill and the Vaccination Bill raise very large questions of public policy. It may be wise to introduce a small paper currency, and to allow people to spread smallpox if they like to pay a sovereign for their licence; but the wisdom has yet to be shown and brought home to the common sense of the House of Commons. This cannot be done without the consumption of much time, and there does not seem to be any time that can be spared for the process. The Burials Bill, the Hares and Rabbits Bill, and the Employers' Liability Bill, seem to have a clear superiority of importance and attraction. Even if the House of Commons worked at nothing else, and worked day and night, it could scarcely get through these three Bills in time to send them to the House of Lords so as to give the Peers a decent opportunity of discussing them. But it is entirely impossible that the House of Commons should do nothing but discuss these Bills. There are the other Government Bills which may not provoke much comment or opposition, but which must occupy some, and perhaps a not inconsiderable, portion of the little time that is left. There are also two subjects not strictly of a legislative character which will awaken keen interest, and can scarcely fail to give rise to important and perhaps long debates. The Collective Note has been presented to the Porte, and within a month it must be known what course the Porte proposes to take to meet the demands of the Powers, and what is the mode of action which it is proposed to take if the reply of the Porte is not satisfactory. The Ministry will necessarily have to make a statement to the House as to the policy which it has followed, and which it intends to follow during the recess. Whatever it does or does not do is certain to be sharply criticized. Secondly, there will, when the

Indian Budget comes on, be an exposition as exhaustive as Lord Hartington can make it of the present state and future prospects of Indian finance. He has already announced that the Government will propose that England shall assume a substantial portion of the cost of the Afghan war. He has further said that the Indian Government does not consider the general state of Indian finance unsatisfactory; but that he himself is not as yet prepared to say that the Indian Government is right. The House of Commons will probably not be inclined to dispute that some portion of the cost of the war should fall on England; but it will ask to be informed on what principles the distribution is made, and the general question of helping India to pay will be complicated by the special question whether any statistics as to the needs of India can be trusted when they proceed from an Administration which has shown itself incompetent to deal with simple financial calculations.

If the three main Bills that still await discussion cannot be carried, one or more must be sacrificed, and whatever sacrifice is to be made had better be made at a very early date, as it would be a sad waste of time to discuss partially any measure which the Government knows it cannot carry. The Hares and Rabbits Bill presents itself to conjecture as the first victim. It cannot be said to be a matter of very urgent necessity that tenants should begin to kill rabbits this year. The amount of personal feeling, of bitterness, and of uneasiness that would be evoked during the passage of the Bill through the House would be out of proportion to the national gain in having this Bill chosen as the Bill of all others which the Government was determined to pass. The repeal of the Malt-tax is a sufficient redemption for this Session of the pledges and offers by which local candidates won over the farmers in the counties; and, so far as gratitude consists in the expectation of favours to come, the gratitude of the farmers to the Liberals will only be stimulated by their having to wait for another year before they can look on rabbits as inalienably their own. If both the Employers' Liability Bill and the Burials Bill cannot be got through, the Government may probably think that it is the Burials Bill that ought to be sacrificed. The Nonconformists are assured that, so far as anything is certain in politics, it is certain that a Burials Bill to their taste will be passed by the present Parliament. They have won, and may view without much reluctance the postponement for a few months of the formal announcement of their victory. The Employers' Liability Bill cannot so easily be abandoned. It raises questions which excite very keen interest in the minds of workmen, and the Government is too deeply committed to an approval of what the workmen claim to venture on disappointing the expectations it has aroused. The employers, too, who view the Bill with an apprehension which it must be owned is by no means entirely unfounded, would probably prefer that some definite course should be taken, even if they did not quite approve of it, rather than that the future of industrial enterprises should be exposed to a painful uncertainty. It may therefore happen that the Government will, when its Irish Bills are disposed of, get through the Employers' Liability Bill and nothing else, contenting itself with this moderate amount of success, with its Budget, with the passing of a few Bills that may not be seriously opposed, and with the consciousness that it has shown that it loves Ireland, if not wisely, yet too well.

BELGIUM AND THE VATICAN.

THE despatches, or some of them, which have passed between the Pope and the Belgian Government have been published in Rome, but they do not do much to explain the recent discontinuance of diplomatic relations with the Vatican. The independence of M. Frère Orban's action in the matter is impaired by the fact that he is only doing in office what he threatened to do when in opposition. In announcing to the Belgian Minister to the Holy See that he had accepted the conduct of foreign affairs, he reminded him that the Liberal party had three times voted for the suppression of the Legation, and he only reserved to himself the right of choosing his own time for taking the step. After this and a similar statement in the Chamber of Deputies it would have been more straightforward if the Belgian Ministry had not sought to find the occasion they wanted in the words or acts of the Pope. It must be supposed that M. Frère Orban intended all along to do what the previous action of the Liberal party had made incumbent upon any Liberal politician who consented to take office without any intimation that on this point he was at issue with his supporters. In that case it seems a little mean to try to fix the responsibility on the Pope. If the Belgian Minister at the Vatican would have been recalled whatever the Pope had done, it cannot be truly said that he has been recalled in consequence of any particular step which the Pope has taken. The Belgian reasons for breaking off diplomatic relations with the Vatican are like the old reasons for drinking. If one had not served M. Frère Orban's purpose, another would at once have been discovered.

The interest, such as it is, of this correspondence lies chiefly in the relations which it shows to exist between the Pope and the Belgian bishops. Leo XIII. is, above all things, a constitutional Pope. He seems completely above the common temptation to use arbitrary weapons to ensure the progress of Liberal ideas. During the long pontificate of Pius IX. the bishops had been reduced to a state of proper insignificance. They were the mere agents of the sovereign Pontiff, and had to the full as little independence as agents usually have. Under Leo XIII. they have ceased to be the mere representatives of the Pope, and have regained something of the dignity which they possessed before Ultramontanism, democracy, and the telegraph had placed them in such constant communication with Rome. The result of this policy has not been favourable to the acceptance of Leo XIII.'s ideas of government. The Pope is exceedingly moderate; the bishops are often not at all moderate. The Pope is exceedingly anxious to keep on good terms with the temporal Governments of Europe; the bishops are often committed to some desperate quarrel with their own Government, to justify which they are disposed to preach the very strongest doctrines as to the general relations between the Church and the civil power. Consequently the Pope has either to adopt his predecessor's methods for the attainment of his own ends, and dragoon the bishops into the acceptance of more liberal ideas; or he has to trust to the slow progress of a better spirit in the Episcopate, and leave them free to act violently now in the hope that hereafter they will be more inclined to use their restored powers in Leo XIII.'s own spirit. In his first dealings with the Belgian bishops the Pope was unexpectedly fortunate. The bishops had given him a plain right to interfere by themselves wandering very far away from the functions ordinarily belonging to spiritual rulers. They were obviously not called upon to abuse the Belgian Constitution, and when the newspapers under their control took upon themselves to do so, the Pope was exercising no undue authority in requesting that such discussions should cease. But when a bishop claims the right of criticizing an Education Bill, it is almost impossible for a Pope to deny it to him. There would have been no real liberality in Leo XIII. if he had tried to prevent the Belgian bishops from speaking their minds on the Education Act of last year because they saw more to disapprove in it than he did. Nor was the Pope himself at all inclined to think well of the measure. It must be recollected that, in the eyes of a Pope, the merits of such legislation as this vary greatly in different countries. What the Church would gladly accept in Prussia or France, where the Governments are hostile and Catholics in a minority, she will not care to accept in a country where she thinks that, by showing fight, she may make better terms for herself. Now Belgium is just such a country. It is true the Liberals are for the moment in power; but they hold office in virtue of a very small majority, a majority which shows no signs of increasing rapidly, and may easily be lost altogether by a single false move on the part of the Government. The bishops think, not unnaturally, that in these circumstances fighting is better policy than surrender. When a Bill which they dislike is brought forward, they have no idea of making the best of it. They look at it in all its aspects; they set to work to estimate the worst that can possibly happen to them if it is passed. If it turns out, as it usually does, that, when one thing has been weighed against another, the Church will rather suffer by the change, they oppose it with all their might. The weapons of their warfare indeed are not carnal, but spiritual; but they are used with a very sufficient spice of carnal zeal. Excom-

munications and refusals of the Sacraments fly about on all sides. In modern times these are the only means left to them of coercing their flocks, and, as their flocks have votes, they must be coerced by any means that offer themselves.

What is a moderate Pope to do when things are in this state? Necessarily his sympathies are with the bishops. He would rather, that is to say, that the law was left as it is. Probably he does not think the proposed change as disastrous as the bishops think it; but he is sorry, nevertheless, that it should be made. He cannot, therefore, take the other side in the controversy. He may think their zeal excessive or their alarm exaggerated, but he will feel that the one is praiseworthy and the other natural, and he will be in no hurry to weaken his influence over them by assuming a tone of impartiality which would certainly be misunderstood by both parties. Englishmen often forget that, among his other characteristics, the POPE is the head of a vast bureaucracy. The chief of a service does not carry his points by openly throwing the service overboard. He is its official defender as regards the outside world, and though he may counsel moderation and throw his weight on the side of compromise, he will be careful to do so with many expressions of fellow-feeling, and many assurances that he is at one with his subordinates as to the character of the opposition they have to encounter, and that he only differs from them as regards the methods of meeting it.

This seems to have been the general drift of the POPE's communications with the Belgian bishops while the Education Bill was under discussion; and it was to be expected that a Government which was on the look-out for an occasion of breaking off diplomatic relations with him, and which meant to manufacture one if none turned up, would find what it wanted somewhere or other in the course of the correspondence. The bishops made the most of the support they had from the Vatican; the Belgian Government made the most of the counter-assurances received from the same quarter; and the POPE himself was probably not disinclined to allow each party to suppose that he was a little more friendly to it than he really was. A disposition of this sort is easily misrepresented by unfriendly critics, and no critic is more unfriendly than the man who wants to pick a quarrel. It would be a mere waste of time to compare the statements made on each side, or to try to estimate the relative accuracy of the descriptions which they give of the cause of the breach. In the present attitude of the Liberal party in Belgium, as in France, a breach was inevitable. The only way in which the hostility of the clergy could have been met without one would have been the State's restricting the clergy within their own sphere, and leaving them entirely unmolested within that sphere. This is a policy which is not to be had from Continental Liberals at present. They are far too angry at finding that the Church is not tumbling to pieces, as, according to their calculations, it should do, to maintain even the appearance of indifference. In Belgium, where parties are still very equally balanced, the prudence of the course which the Liberals seem disposed to adopt is even more doubtful than in France.

THE WHIGS AND THE PARTY OF MOVEMENT.

THE most remarkable occurrence since the general election is the secession of the Whigs from the Ministerial majority on the Irish Disturbance Bill. Politicians widely differing in opinion agree in recognizing the importance of the protest against the policy of the Government, and more than one section regrets the early disclosure of a political schism which had for some time been obviously inevitable. Moderate Liberals congratulated themselves too hastily on the facility for reuniting the party which was offered by the general acceptance of a negative issue. The revolutionary faction, with Mr. GLADSTONE at its head, urged the suppression of internal differences in a common hostility to the foreign and Indian policy of Lord BEACONSFIELD's Government. The Nonconformists ostentatiously postponed the disestablishment of the Church; proposals of Irish legislation were slurred over in indefinite phrases; and even Mr. GOSCHEN, who afterwards declined to join the new Ministry, took an active part in the agitation against a continuance of Conservative rule. It was easy to unite in a denunciation of measures which, as Mr. GLADSTONE himself sometimes argued, involved no political theory or principle. The Treaty of Berlin and the Afghan war had no connexion with the maintenance of the Established Church, or with the rights of property. To engage in a conscientious effort for the overthrow of Lord BEACONSFIELD it was only necessary to be in some sense a Liberal partisan. Many of those who aided the movement have since doubted whether the late Ministry was the worst on record. Even if Lord BEACONSFIELD's Cabinet was justly charged with a turbulent foreign policy, assaults on domestic institutions are more troublesome and more alarming. The PRIME MINISTER, with an irresistible majority at his back, will not be content, as in his last term of office, with harassing every separate interest. In a few weeks his legislative projects have alienated many of his most loyal supporters. The breach may perhaps be temporarily patched up, but the divergence of policy will be permanent. The measures affecting property in land which are announced for next Session will be more comprehensive than the Irish Disturbance Bill, though they can scarcely be more unjust in principle. The extension of household suffrage to counties will perhaps be more seriously considered when it is illustrated by the recent acts of its promoters.

Some of Mr. GLADSTONE's most devoted supporters regard with apprehension and regret the impending breach between the Liberal aristocracy and the party of movement; but remonstrances and insinuated threats will alike fail to prevent a rupture. The malcontents are in vain reminded of the success of tenant-farmer candidates in some county constituencies, and it is useless to warn them that they may lose their seats and see a pure Liberal majority "pledged to land reforms of a decided character, which they themselves would have no opportunity "of moderating or even discussing." They already perceive their inability to moderate or to discuss with effect one of the most iniquitous of so-called land reforms. If they had assisted Mr. GLADSTONE in passing the Irish Disturbance Bill, they would have been not unjustly taxed with selfish inconsistency if they hereafter resisted the application of similar doctrines to themselves. It is true that their opposition or abstention has betrayed their numerical weakness. After the loss of more than seventy adherents, Mr. GLADSTONE was still able to overwhelm argument and justice by a remaining majority of eighty. If every member of the Liberal party had voted according to his sincere convictions, it is doubtful whether the second reading of the Disturbance Bill would have been carried. The extreme Radicals are justly confident in their strength; but the best of them would wish to be kept in countenance, as in former times, by some of the representatives of rank and property. The apologies for spoliation which are founded on the acquiescence of Lord HARTINGTON in Mr. GLADSTONE's measures stand on too narrow a basis; and there is reason to fear that the solitary Whig occupant of the Treasury Bench may soon begin to waver. While Mr. GLADSTONE and Mr. FORSTER talk of comprehensive dealing with Irish land, Lord HARTINGTON proposes to inquire whether the provisions of the Act of 1870 ought to be extended or restricted. In the meantime no blame attaches to a statesman who is reluctant to sever his connexion with the party to which he has uniformly belonged. The appeals of the more scrupulous Radicals to the reluctant Whigs who are dropping behind are sincere, and not discreditable. It would be pleasant to try experiments on property with the cheerful acquiescence of some of the greatest hereditary landowners. The rude suppression of plutocracy by the votes of mechanics and labourers is only desired by English Jacobins.

It will not be the smallest of the injuries which Mr. GLADSTONE will have inflicted on his country if he succeeds in dissolving the historical union of the Whigs with the Liberal party. As long as the struggle lasted between Parliament and the Crown, the families which had effected the Revolution of 1688 were the natural advocates of the claims of the House of Commons. Their representatives in later generations down to the present time have habitually maintained popular principles; and they have been rewarded for their services by undisputed pre-eminence in office and in the guidance of the party. Although they sometimes excited discontent by their oligarchical exclusiveness, their less privileged followers were ordinarily content with a modest

share of power and emolument. In one of Lord PALMERSTON'S Cabinets it was asserted that all his colleagues were descended from a common ancestress who had been alive within the present century. It would be a mistake to suppose that the aristocratic Whigs were not sincerely devoted to the principles which they professed. Lord JOHN RUSSELL, who was for several years their leader, was a thoroughly zealous reformer; while Lord PALMERSTON, who was much less eager for change, was never accepted by the hereditary Whigs as one of themselves. The late Lord GREY proposed the reform of Parliament in his youth, and effected it in his later years. His successor, the present Earl, was in advance of his contemporaries in promoting negro emancipation and the abolition of the Corn Laws. It is to his class that the country has been indebted for the non-coincidence of political divisions with the lines of social stratification. A Whig Ministry or a Whig Opposition was only possible in a country where fundamental principles were undisputed. A partial and temporary suspension of the payment of rent by Act of Parliament is inconsistent with the convictions and instincts of the entire Whig party.

The catastrophe which approaches, if it has not already arrived, might have been long postponed but for the combination in Mr. GLADSTONE'S person of the genius of a great orator and the position of a conspicuous statesman with the temper of a demagogue. His restless ambition has already disintegrated the great majority which his energy and eloquence had organized. The late Government, during six years of office, lost only two supporters, of whom one has since formally rejoined the party. It is true that Lord DERBY and Lord CARNARVON were important political personages; but their position renders more remarkable the fact that they were not attended in their retirement by a single follower. It will be interesting to learn whether Lord DERBY'S newly-formed alliance with the Liberal party will survive the discussion of the Irish Disturbance Bill. Lord LANSDOWNE has not yet attained the same official rank, but his resignation is understood to express the opinion of a large and powerful body; and his position as a great Irish landlord who is known to have done much to improve the condition of his tenantry entitles his judgment to considerable weight. Coalition with the Conservatives will probably be deferred for the present; and it is not desirable that it should be accelerated. The dissatisfied Liberals will, on the contrary, be anxious on all convenient occasions to exhibit and proclaim their fidelity to the party; but the conflict of principles will not fail to recur. Personal feeling will disincline them to follow Lord BEACONSFIELD; and Sir STAFFORD NORTHCOTE, with all his ability and good qualities, is scarcely equal to the task of forming and consolidating a new political organization. If there were a PEEL in the House of Commons, a Liberal-Conservative party might gradually acquire the confidence of the country. A DISRAELI in his vigour would break up the majority, and perhaps the Government, within twelve months, though he might possibly not be able to take its place. Want of discipline and serious purpose in the Conservative ranks may tend to save Mr. GLADSTONE from the consequences of his mistakes. Nothing can be sillier than speeches made for the purpose of obstructing business, or impertinent criticisms on Mr. GLADSTONE'S management of his private estate. Sir STAFFORD NORTHCOTE undoubtedly disapproves of levity and impropriety, but he fails to enforce the moderation and prudence which can alone render a minority formidable. The party ought to be ready to profit by such opportunities as that which may perhaps be afforded if Mr. GLADSTONE makes war upon Turkey, or forms an offensive alliance with Russia.

PUBLIC MEETINGS AND THE LAW OF LIBEL.

THE Select Committee appointed to inquire into the present state of the law of libel seem to have prepared their Report on the principle which has lately been applied to legislation generally. They have not called any witnesses; but, as they are of opinion that sufficient information has been collected by a former Committee, this is a matter on which they may claim to use their own judgment. The Report founded on this information is not equally removed from criticism. One object of appointing a Select Committee is to get a body of evidence digested for the benefit of the House of Commons. For this purpose such a Report as that which this particular Committee has thrown upon the table is utterly valueless. It states the conclusion at which the Committee have arrived, but it gives no reason why this conclusion should be better than any other. The Report seems to have been constructed with an eye merely to speed. The theory that it does not much matter what you say, provided that you say something, and say it quickly, is a very good one when applied to speeches at a wedding-breakfast; but it is less appropriate when it is applied to the Report of a Select Committee. In this instance the Committee began by unduly limiting the scope of their inquiry, and ended by making a most important and doubtful recommendation, without giving a single reason for the change they advise. The matter referred to them was the present state of the law of libel; but they have considered no part of this law, except that "affecting civil actions and criminal prosecutions for newspaper libel," while their Report deals with only a single point even of the part considered. As regards "the extension of privilege to newspaper "reports of the proceedings of a public meeting," the Committee have formed an opinion. "After careful consideration," they "have come to the conclusion that the "balance of convenience requires that further protection "should be given to such reports." It is not stated why the balance of convenience requires this. It is enough for Parliament and the public that the Committee think so. This view of the function of a Select Committee has the fault of making it both judge and jury. It has hitherto been considered that the more nearly the report of a Committee resembles a charge to a jury the better its purpose is fulfilled. The House of Commons was supposed to want to have the evidence on both sides succinctly stated, and the considerations which ought to determine their verdict set out side by side. In the opinion of this Committee the House only wants to be told what to do, in the fewest possible words. Newspaper reports of the proceedings of public meetings require further protection. Do not waste time in asking questions, but give them the further protection they require. Never mind what the reasons for making the change are; we know them, and that should be enough for you. If you want something that at all events looks like a reason, take the balance of convenience. This is a nice elastic phrase, and suggests an argument which is not easily refuted. The balance of convenience may be simply the convenience of newspaper proprietors; we do not say whether it is anything more or not. It is sufficient that, in the opinion of the Committee, this mysterious balance inclines on the side of a change in the law.

When a Select Committee assumes this autocratic tone, and gives its conclusions without its reasons, the readers of its report are driven to be autocratic in their turn. The balance of convenience seems to us to incline in the opposite direction to that indicated by the Committee. Had the Committee condescended to bandy arguments we might very possibly have been convinced. But in the absence of anything of the kind our opinion remains what it was. It is right that the conductors of newspapers should receive reasonable protection; but the "balance of convenience requires" that the public should receive some protection as well. If the recommendation of the Committee be adopted, it is hard to see where this protection is to come from. The newspapers which would publish libels if they could do so without risk may not be numerous, but such journals exist; and if the law of libel is altered as the Committee suggest, they will be likely to increase and multiply. The proposed liberty of publishing reports of the proceedings of a public meeting will make their interesting task very much easier. Provided that a public meeting is "lawfully convened for a lawful "purpose," and is open to the public, and the report is fair and accurate and published without malice, and the publication of the matter complained of is for the public benefit, these reports are to be privileged. There is not one of these conditions which a libellous report may not be expected to satisfy. What the Committee mean by the lawful convening of a public meeting it is impossible to say—unless they are under the impression that it must be done by the town bellman. They might at least have given some instances of what is an unlawful convening of a public meeting. Nor is it easy to understand what is not a lawful purpose for a public meeting. No matter

short time back—shows that a particular corps has forgotten its military obligations; but the return to discipline and good sense is rarely long delayed.

Lord DERBY remarked the other day that the success of the Volunteer movement was a striking tribute to the old-fashioned view of the superiority of private over State action. It used to be thought that the State spoiled everything it touched, and that the main secret of useful reform was to keep Government aid at a distance. This notion is now pretty well set aside as a *doctrinaire* superstition. The first condition of useful change is supposed to be to get the Government committed to the necessity of it. Otherwise there is very little chance of carrying it out by Act of Parliament; and without an Act of Parliament the modern reformer can do nothing. If the Volunteer movement had begun in 1880, instead of in 1859, nothing would have been talked about except deputations and memorials, the indolence of the War Office, and the certainty that it would in the end have to be stimulated by a liberal application of the popular spur. In 1880 the Volunteers would have taken to agitation; in 1859 they took to drilling. The result has shown how much can be done by private effort, even in the department of the public service in which private effort usually counts for least. It is difficult to realize the condition of England as regards defence before the Volunteer movement began. If an invading army had once effected a landing, it would have had the ground almost to itself. There would have been next to no soldiers at the disposal of the Government, and the material out of which soldiers might be made would have been utterly untrained. To-day the Volunteers constitute a powerful defensive army, while the number of men who have passed through the force and could regain their old efficiency in a very short time must be considerable. The sense of security which this fact gives has been very evident during the last few years. There have been materials enough for alarm in the foreign relations of Great Britain, but there has been no revival of the old invasion panic. If a war now broke out, Englishmen might be uneasy about their food supplies, or about the supply of recruits to the regular army, but they would not be much disturbed by the prospect of seeing a foreign army in possession of London. It is possible of course that their present security is exaggerated, as their former alarm may have been; but it is certain that in a conflict with any force which an enemy would be able to land suddenly on our shores, the Volunteers would at all events have the advantage of numbers. It is to the French and German war perhaps that the Volunteers owe the largest part of their efficiency. The old idea of the force, as a mere body of sharpshooters who might pick off an enemy from behind walls and hedges while the regular army opposed him in front, did not quite die out till it was disposed of by the German treatment of the *francs-tireurs*. From that time it was understood that, if the Volunteers were to be useful, it must be as soldiers, not as civilians with a knack of bringing down an enemy at long distances.

The General Order holds out a prospect of a large Volunteer Review in Windsor Great Park. Whether one ought to have been held in Hyde Park during the present summer is a point on which opinions will differ. The growth of London, and the increasing disposition of Londoners to see whatever is to be seen, do undoubtedly make the collection of very large crowds in the Park extremely inconvenient. The day on which the Volunteer review was to be held would have been a holiday, not only for those who wished to keep it as such, but for many who had no wish of the kind. The streets would have been given up to Volunteer regiments with their attendant crowds, and the traffic of London would to a great extent have been subordinated to the necessities of soldiers and pleasure-seekers. Still, what would be intolerable if it happened often may be quite endurable when it happens only once in a way. The Volunteer force does not come of age every day, and a similar occasion for holding a review in Hyde Park could scarcely have again presented itself till the movement is half a century old. Taking the very exceptional nature of the case into account, the authorities might, we think, with advantage have erred on the side of liberality, and have allowed the review to take place.

THE EIGHTEENTH CENTURY AND ITS POOR.

THE reader who knows the social life of England in the last century chiefly through its classics very naturally takes a more cheerful view of the state of society then than he would form from a study of its literature of special subjects, political or religious. Perhaps one of the characteristics of the age was a tendency to take things easily, to see everything at its brightest. There will always be people who, either from principle or temperament, scrutinize awkward facts, and show them up; but the pictures of society that live are not from their hands. In the life shown us, whether in letters or by the essayists, people in the last century did not trouble themselves with great schemes, whether useful or benevolent; they accepted things as they were. They were social, friendly, easy, living and letting live. It reads like a very comfortable world. People of this turn see what they want to see, and the poet and the essayist saw things for them in the same spirit. If the country had to be described, they saw it in its summer aspect, and its rural population in holiday trim and Arcadian surroundings; while in town—which was their world—and writing for the town, there was always something more in their line of observation, as well as more certain to interest their readers, than the pictures of poverty and distress which habit had made familiar, and which had come to be taken as part of the inevitable state of things. The beggars, though they did "swarm," were something too distinct from the humanity which these writers cared for to excite sympathy in any other form than an occasional alms, or as adding a picturesque point to a situation. It is in works of a different class that we read what was the true condition of the poor generally, in many distinct periods of the century; works in which such themes as the alarming increase of poor, the decay of population, the want of work, the scarcity of provisions, the pressure of poor-rates, bread riots, the horrors of workhouses, the swarms of vagrants, are dwelt upon from different points of view, sometimes with pity, more often with the alarm, indignation, and cruelty of fear; but always with an assumption that the facts were notorious and undeniable. It was through pamphlets and critical notices of them—a class of reading that would not reach the general eye or excite the attention of the ordinary reader—that the world was informed of the growing mischief and of the remedies suggested. Anonymous gentlemen address members of Parliament, proposing some employment for useless hands in England and Wales; some protest against the engrossing of farms, or call for a change in the Poor-laws "that shall restrict relief to the deserving poor," or for severer laws against vagrants, &c. This lowest class is treated in a tone of loathing that renders more natural than we had been accustomed to think it that well-known letter of the Duchess of Buckingham to Selina, Countess of Huntingdon, on the impertinence of Methodism and its outrage on good breeding in reducing all ranks to the common level of sinners. "It is monstrous to be told," says her Grace, "that you have a heart as sinful as the common wretches that crawl the earth." The vagrant classes were really regarded as vermin to be hunted down; creatures that crawled on the earth, and must be got rid of. Thomas Alcock, writing on the Poor-laws in the very middle of the century, opens with the statement that, while England was the only country in Europe where the poor are provided for by law, yet the number of street beggars was greater with us than abroad. This he proposes to remedy by restricting the poor to indoor relief, tempering the scheme by many humane suggestions for their good. It is when he comes to those "indigent persons" who should object to the new system that the prevailing view declares itself. He lays down three degrees of punishment for contumacy. First, if any idle person shall be found begging twelve hours after notice to depart, he shall be sent to the House of Correction and hard labour for a week, and then dismissed to his place of settlement; on a second offence he shall be taken up, whipped, and confined to hard labour for a month:—

> And upon a third offense to be confined as above till the quarter sessions of the peace, and on proof of such a person being an incorrigible rogue, &c., to be transported, *made a slave of*, or whatsoever the quarter sessions shall think proper.

In a sermon on the text "Be ye therefore merciful," published about the same date, we find a passage quoted with approval "as a specimen of the forcible manner in which our author frequently expresses himself," which begins with these words:—"Here there is one caution to be laid down, which is of the last consequence to be carefully attended to; and that is that the vagrant beggar is an eternal exception to all the precepts and dictates of Christian charity. The race of vagrant beggars are the vilest race that ever cursed the earth." Of course the parish officers were ready enough to profit by this wide exemption from an embarrassing precept, and to get rid of their more troublesome dependents by the shortest and handiest methods. A voice was now and then raised against these proceedings. "The miserable condition of the poor," we read (1759), "in this free and opulent kingdom has long been a disgrace to our police. While some vile impostors have abused charity, other wretched objects of less invention or more honesty have suffered all the extremities of indigence and distress, often aggravated by the inhumanity of parish officers. To see our fellow-creatures hunted from parish to parish like noxious animals for no other crime than beggary must fill every compassionate breast with the deepest concern." A writer in 1765, enlarging on the "excessive and amazing number of the poor," with suggestions

for the radical cure of these evils, sums them up in an opening inquiry:—

What would a stranger say to find a people exhibiting such a distinguished external appearance of prosperity, yet at the very same time their streets swarming with wretched objects exposed to all the horrors of want and misery; their roads infested with lawless miscreants, to the terror of innocent travellers; their parishes groaning under a burden of poor creatures crammed together in places miscalled workhouses, where they linger out an indolent, nasty existence, their numbers increasing yearly to such a degree that it has long engaged the attention of the legislature, and exercised the ingenuity of individuals, hitherto in vain.

His radical cure is the abolition of entail and primogeniture. Other writers, quite as eloquent on the evils existing, are more various in their views as to the causes of the mischief, ranging from alehouses, mountebanks, and the licentiousness of Parliamentary elections, to foreign *teas*. "The Poor-laws of England are the universal encouragers of idleness, drunkenness, and tea-drinkings;" therefore, argues one, restrict their aid only to those who deserve it; on which a reviewer naturally observes that if the proposal that only those who should appear on certificate to deserve relief were adopted, many a poor wretch might be left to starve in the streets, for if the horrors of the parish workhouse will not deter them from idleness and dissipation, nothing else probably will ever be able to do it. He adds that few parishes were disinterested enough to put their workhouses under better regulation, lest it should increase the number seeking admission. A recognition of this temper in the guardians of the poor ought, we think, to have made the reviewer more indulgent in his tone towards Religious Houses than appears in his grudging statement "that these houses *harboured* incredible numbers of poor persons in England," and "that we need only consult our statutes to see what severe laws the legislature thought it needful to enact against vagrants upon the dissolution of those burdensome receptacles of ignorance and idleness." Perhaps it was this association of religion with the abject forms of poverty which made the early Methodist sympathy with the poorest classes so unpopular, and indeed offensive. When the Prince of Wales some years before this had inquired why he had not seen Lady Huntingdon lately at his Court, and was answered, "She is praying with the beggars," the reply expressed the general view that here was the *ne plus ultra* of mischievous fanaticism.

Not that there were wanting those who pleaded for this miserable class, who hazarded an apology even for beggars in real distress, and protested against the tyranny exercised over the helpless aged. One writer (1775) explains that this tyranny was carried to the greatest pitch in large cities and in small solitary villages, and ventures to point out that the obstinacy and profligacy of the poor, which is the excuse for everything, found its parallel among their betters, observing that "many of the maintainers of the poor will swear profanely and drink to excess as well as the poor themselves, but would think it hard to be starved and whipped and poisoned as a punishment for their swearing and drunkenness." He quotes "a very just remark of the late Mr. Fielding, whose opportunities of knowledge of this kind were as little circumscribed as most men's," that "the vices of the poor are better known than their miseries; they starve, they freeze, and rot among themselves; they beg and steal and rob among their betters."

The food of the labouring poor is a frequent topic with writers in this line of subject. Fresh meat, as most people know, was not then as constant an article even on the table of the farmer as it is now, while of the labourers it is said that multitudes of families hardly ever taste fresh "flesh meat," or, indeed, any sort of butchers' meat (this excludes bacon), from the beginning of the year to the end. An ugly word *morts* expressively indicates one description of animal food that found consumers. One writer could specify counties within a day's ride of the capital where the day labourer has scarce a morsel of any kind of flesh for his family except at mowing time, "unless the master farmer who employs the labourer gratifies him with part of a sheep which when dying had been butchered." The difficulty about milk existed then as now. Milk, even skimmed milk, was consumed by the pigs, and was not to be bought by the labourer. And bread, as a rule, was dearer than with us, and frequently at an almost famine price. Yet there seems to have been a steady advance, most jealously watched, in the requirements of the labourer through all this period. It is probably according to good or bad seasons that this shows itself; but all through it was making some way. Thus one writer (1767) finds a grievance in the fact of the poor eating more and better wheat bread, and "living in a quite different way than heretofore." His reviewer laments that the common people, who are the strength of the nation, are decreasing very fast in Britain, some rising above the class, but a much greater proportion sinking below it, owing to the general taste for ostentation and luxury, a contagion which has extended to the very dregs of the people. An inquirer of the same date is suspicious of the advance of education among the poor. He has heard that in "the metropolis of this kingdom there are five or six thousand children of the very lowest of the people cloathed and educated at the expense of private persons, the males instructed in reading, writing, and arithmetic, the females in reading, knitting, and needlework." The want in this scheme of hours of labour for the boys distresses him. The girls have their needlework, but he adds that "if some meaner and more laborious employment could be found for them and take place of, or at least be joined along with the other, it would undoubtedly be much more suitable to the lowness of their birth and station, and have a natural tendency to fit them for those servile occupations which in the ordinary course of Providence are most likely to fall to their share."

Riots on account of the dearness of provisions are of frequent occurrence in these records, instigated, as some said, by the "manufacturers" (now called "hands") as opposed to labourers; and here it is those whose wages are highest who set the example. The "manufacturer" is regarded with jealousy by most of these writers, who saw but a very little way into the great future of England, though what they wrote sounded very good sense to their readers and reviewers.

Amongst other topics dwelt upon, we find the decay of population, supported by statistics which sound strange to modern ears. Dr. Richard Price, who, in his critic's estimate, stands at the head of his department, shows that while "Dr. Davenant ('the best of all political writers') tells us that at Michaelmas 1685 the number of houses in all England and Wales was 1,300,000, of which 554,631 were houses of only one chimney," whereas "previously, at the Restoration, the number had been 1,230,000, showing an increase of 300,000":—

But what a melancholy reverse has taken place since! In 1759 the number of houses in England and Wales was 986,482, of which not more than 330,000 were cottages, having less than seven windows. In 1766, notwithstanding the increase of buildings in London, the number of houses was reduced to 980,692. According to these accounts, then, our people have, since the year 1690, decreased near a million and a half. And the waste has fallen principally on the inhabitants of cottages.

Dr. Price's object is to show the cause of this decay to be the "engrossing of farms" and consequent diminution of labour in the country, multitudes of cottages being pulled down; and the flocking of the people to towns, of which he proves the unhealthiness by tables of statistics, showing the proportion of deaths annually in country and town, in London and foreign cities, immensely to the disadvantage of the cities. His conclusion is that the number of people in England and Wales at the time of his writing, 1771, may be stated as *probably* not more than four millions and a half, but *certainly* not five millions. The Census (1871), taken exactly a hundred years later, gives the numbers for England and Wales as 22,791,578. This same writer, "the celebrated author of the *Observations on Reversionary Payments*," had a scheme bearing some analogy to Lord Carnarvon's recent project, though less ambitious in its design, as being voluntary and proposing a substitute for Friendly Societies, and only indirectly affecting the Poor-laws. According to this scheme the churchwardens and overseers of every parish were to be legally empowered to grant life annuities to those who may be inclined to purchase them, "to be paid out of the Poor-rates of the parish; the land and other property of the parish to be chargeable." It is proposed that no annuity depending upon one life should exceed 20*l.* per annum, and that no less sum than 5*l.* be allowed to be employed in the purchase of an annuity. To the disgust of the promoters of the Bill, it was "abruptly" rejected by the Lords by a majority of 55 to 6.

Of course there was another side to this depressing picture, and ideal examples were to be found of a happy, prosperous, and contented peasantry. But these are telling and startling facts all the same. The elegant literature of the period, which we have contrasted in tone with the sources from which these facts are derived, has, however, something to say about the beggars. Goldsmith was not a man either to ignore their existence or to be hard upon them—he had a fellow-feeling for the vagrants. Our readers will remember that excursion into the country which the Citizen of the World takes with the Man in Black, in which they met so many suppliants for their charity. The language of this gentleman is evidently derived from the sort of reading on which we have been commenting. He is familiar with all the arguments, and as stern in tone as the most inexorable utilitarian; but he cannot resist the spoken tale of distress, and surreptitiously empties his pockets while he rails against the beggars with an increasing fury.

Self-gratulation is never a safe state of mind; but the nineteenth century has perhaps a right to claim some advance over its predecessor in its tone towards the poor and its efforts for their good.

THE GLADSTONIAN GERM THEORY.

WHATEVER may be said against the Compensation for Disturbance Bill (and we fear a good deal may be said against it), it cannot be denied that its eccentricities have afforded political practice and exercise of the most valuable kind to the youthful Parliament of 1880. It is often recommended that young sportsmen should be entered as soon as possible at snipe, because the vagaries of that remarkable fowl, though they may sorely trouble the novice at first, afford him better, because more difficult, practice than anything else. The Compensation for Disturbance Bill is surely the snipe of the political fauna. No mortal save the shrewdest and most practised politician knows what it is going to be at, and the zig-zags of its progress (if it is to be called progress) would defy the powers of a senior wrangler to reduce them to a comfortable formula. It is barely three weeks old, and during that time it has gone through metamorphoses enough for a Proteus. To-day it is one thing, to-morrow it is something not merely different, but irreconcilable. If Addison were alive, and were not restrained by political considerations, we might have a most delightful "vision" of this singular

piece of legislation. The bewildering way in which its clauses advance, retreat, and rally at the bidding of Mr. Gladstone and Mr. Forster; the easy grace with which the Government declare a point to be vital, to be indispensable, to be the necessary preventive of civil war, this minute, and withdraw it the next; the original theory of play on which they post their stakes and then draw them when they see the cards are bad—all deserve a more lasting monument than is likely to be accorded them. Since that remarkable passage in *Henry VI.* where about fourteen distinct armies solemnly enter the stage at one side, march across, disappear on the other, and then repeat the proceeding, all in the space of twice as many decasyllables, nothing has equalled Mr. Forster's army of constabulary, which, appearing at fifty different services of fifty different processes, is held up to the horrified House as a force big enough to fight a respectable battle by the simple process of multiplying men by times of service. It is really terrible to think of what might be made of the statistics of the London police on this principle. Sir Edmund Henderson could, we should say, be represented as commanding a body of men about as large as that which Xerxes presided over at his famous review. Nor are those wonderful evictions which on investigation usually dwindle from a hundred and fifty to fifteen, and from fifty to five, to be denied their due meed of attention. Indeed a captious critic might draw an interesting parallel between the way in which ingenious directors occasionally draw up balance-sheets to delude prying eyes, and the way in which the statistics for justifying the urgency of this measure seem to have been prepared. If the chiefs of the constabulary in Mayo will only countermarch their men quick enough, it will soon be in Mr. Forster's power to point out that a force larger than the whole Irish contingent is employed there; and if the evictions are reckoned on the same plan, why not count each member of the family and each one of the sympathizing friends who come to stone the constabulary as a victim? It can soon be shown that in some districts no one Irishman of fiction has a home. All these things are, we repeat, simply invaluable as exercises and models to the youthful politician. But there is one result of the debates which overtops them all. This is the new theory of germs which Mr. Gladstone has introduced and expounded. The Prime Minister is, and always has been, very fertile in contributions to politics of the higher kind. But the Theory of Centrifugal Representation itself, great as were its merits, cannot be fairly held to rank with this new germ-theory. For the one is limited, casual, and might even in altered circumstances be inconvenient to the propounder. The other is unlimited in its scope, gives promise of immense "fruit" in the Baconian sense, and is of that happy conception that it can never be otherwise than profitable to the adroit user.

It is not necessary to indicate at any great length the circumstances under which this great discovery was first promulgated. Like all Mr. Gladstone's contributions to political science, it was in all probability a happy thought. But it is well known that, while most other politicians of eminence who are addicted to happy thoughts—Lord Beaconsfield is a conspicuous instance—throw away the case after the firework has duly coruscated and crackled, Mr. Gladstone has a remarkable habit of keeping his for future use, and of asserting them to be the deliberate product of his careful days and laborious nights of meditation and experience. When he first maintained that the germ of Mr. Forster's Bill was to be found in the Act of 1870, it naturally seemed only a pleasing utterance of a polemical character. To say that a proposition which the Bill of 1870 directly negatives and bars has its germ contained in that Bill is perhaps what some one has called "a really luminous paradox"—that is to say, one of those dazzling intellectual efforts which make it perfectly impossible for the humble eye of the on-looker to see anything at all. But the argument apparently seemed to Mr. Gladstone and his friends too good to be lost. They first maintained that the germ of the Bill of 1880 (which says that compensation for eviction for non-payment of rent shall be allowed) was in the Act of 1870 (which says that compensation for eviction for non-payment of rent shall not be allowed). Then they maintained that the now defunct amendment, or clause, or whatever it is to be called, of Mr. Law was equally a germ in the original Bill or clause, or whatever it is to be called—for the eccentricities of this measure have upset all Parliamentary nomenclature—of Mr. Forster. Nobody indeed could see it there; but then, as it might have been argued, it is rarely possible to see germs except with a microscope. The worst of the germ-theory in this instance is that it leads to awkward inferences. For, if the germ was there before Mr. Law's amendment, it is there still, and may be evolved any day, to the great discontent of Mr. Parnell and his friends. On the other hand, there is some comfort to be found by the enemies of the Bill as a whole in the proceeding. For if one germ can be stifled, why not another? If Mr. Law's amendment can be left in the loins of its father Mr. Forster's Bill, why should not Mr. Forster's Bill be left in the loins of its father the Act of 1870? The assertion of paternity rests on the same authority in both cases, and what is sauce for the grandson is sauce for the son. Unluckily this extremely logical solution of the difficulty is, for good reasons, not likely to recommend itself to Mr. Gladstone. We have a dim remembrance of once reading a fearful and wonderful Irish poem which related the history of a duel between two chieftains, and in which the exploits of each were introduced by these words, truly epic in character:—

> Then many skilful, daring, wondrous feats
> The hero showed.

The upshot of these feats was (unless we mistake) that the more famous champion fitted something like an expanding harpoon between his toes, and kicked it up into his enemy's stomach. Mr. Gladstone, like Cuchullin or Fingal, or whoever it was, has been showing many skilful, daring, wondrous feats, and his object is apparently not dissimilar to that of the hero—to kick some kind of disreputable weapon into the stomach of the Irish landlords. Hitherto he has not succeeded in getting the harpoon nicely fixed, but that is doubtless his misfortune.

It is pleasant, and may be commended to the study of Englishmen and Scotchmen, to contemplate a few of the more probable and immediate results of the germ-theory. Let us take only the principal of those measures upon which Mr. Gladstone has just informed us that the heart of the Government is particularly set—the Employers' Bill, the Hares and Rabbits Bill, the Burials Bill. All these three admit of the most admirable applications of the new discovery. When, for instance, the aspirations of one of our contemporaries are realized; when Mr. Gladstone has, let us say, disfranchised all who pay more than a certain assessment of rates—this, by the way, could be got out of Reform Bill precedents by the germ-theory with the greatest ease—and has, as a means of bringing Parliament into "harmony," given all the Middlesex and Surrey seats to Northampton and Birmingham—it is quite clear that peddling measures like those just quoted will never do. The constituencies will arise in their might and demand the application of the germ-theory at once. If occupier and tenant are to have equal and, on the tenant's side, inalienable rights to the game which runs about the land, why not to the land itself? The germ of the latter proposal lies in the former much more clearly than the germ of the Compensation for Disturbance Bill lies in the Act of 1870. If, again, the Burials Bill is accepted the case is still clearer. The most bigoted and prejudiced Tory must admit that the germ of the word "church" lies in the word "churchyard." As to the Employers' Liability Bill, that, whatever may be thought of the measure itself, might germinate into anything—indeed it is, as already hinted, the essence of the theory that anything may germinate into anything. A vision of political pangenesis seems to have possessed Mr. Gladstone's lofty and penetrating mind. The germ of the contradictory lies in its opposite, as the greatest philosophers have taught; and this, after all, is exactly what Mr. Gladstone affirms of the Bills of 1870 and 1880. The former says "Thou shalt not," and Mr. Gladstone tells us that this contains the germ of "Thou shalt." The latest thing in this line—or at least one of the latest, for it is always rash to speak of such a "Cynthia of the minute" as the Compensation for Disturbance Bill in the present tense—is a phrase about the landlord allowing a reasonable alternative. Who is so dull as not to see in this the germ of the tenant's refusing that alternative as unreasonable? Indeed the possibilities of the subject are altogether too much for us, and we can only repeat, for a different reason, our formerly expressed pity for the unfortunate County Court Judge. For it appears from Mr. Gladstone's speeches that this unhappy man is supposed to know all about the germ-theory and the development it requires. In fact, he knew all about it before, and the defunct amendment, for instance, was introduced not to lay down any new principle, but to expound and define to stupid Tory members and backsliding Whigs what Mr. Gladstone and the County Court Judge knew perfectly well and saw quite clearly. Now Irishmen are not usually deficient in acuteness, and County Court Judges are, as a rule, tolerably shrewd specimens of the human race; but the germs latent in this remarkable Bill will, we suspect, puzzle even an Irish County Court Judge. Indeed there may be, and probably are, as many germs in it as in a gallon of London Particular water. All these the Judge must be well up to, and if the tenant catches him ignoring the particular bacterium which makes for his own interest, why that County Court Judge had better look out.

These are but a few remarks on the wide subject which Mr. Gladstone's words have opened to the mental gaze. The application of the germ-theory to Mr. Biggar's doctrine of a reasonable amount of physical force applicable to bad landlords is a tempting field, and it may perhaps be pointed out that Mr. Biggar is a merciful man in his way; for when the landlord has been ruined, the physical force argument will perhaps on the whole be the kindest. The germs of Mr. Forster's system of arithmetic as applied to constables also deserve the most careful study, which cannot fail, as we have already hinted, to reward the practical politician. But here, as has so often happened with the subjects provided for handling by the present Government, the very exuberance and extent of them makes those subjects difficult to treat. To sweep up the messes Her Majesty's Ministers have made in their brief period of office would take more than the famous "seven maids with seven mops." To calculate the applications of the germ theory would take more than the late Mr. Babbage and all his machines.

CLERICAL FELLOWSHIPS.

THE question raised the other day in the House of Commons by Mr. Roundell is not quite so simple a one as he and his friends seemed to imagine. The reproach of having "fallen among Liberationists" may perhaps not apply to them—indeed Mr. Beresford Hope was careful to explain that it did not apply to the mover himself—in the sense of having made themselves

the conscious tools and agents of the Liberation Society, but it is not the less true that their line of argument, in its one-sided and narrow concentration on certain aspects only of what is really a matter of wider and more practical import, recalls the familiar logic of the Liberationist platform. Mr. Richard indeed frankly acknowledged that to him the question was interesting only as a step towards bringing about the separation of Church and State. To Mr. Roundell and his supporters the election to college fellowships appeared to present itself in two points of view exclusively, or rather under two aspects of one point of view, in its bearing on the emoluments. In the first place, it is "a principle dear to the Liberal party" that these endowments should not be "*the property* of any particular Church or sect, but of the nation;" in other words, the appeal is to the principle of absolute religious equality. And in the next place, they ought to be awarded strictly on the principle of *palmam qui meruit ferat*, by the test of competitive examination: "colleges should be in a position to elect the best men." Yet it is surely, to say the least, far from being obvious at the first blush that either of these principles can at once be accepted without qualification or reserve, while it is on the other hand clear that they are not the only points to be considered. College fellowships in many cases have, and were intended to have, duties attached to them, and cannot therefore be regarded merely as prizes of intellectual proficiency; and this—apart from any question of the real or supposed rights of the Church of England in the property—may seriously affect the expediency of abolishing all religious guarantees. It has always hitherto been held on similar grounds that the purely competitive test must be to a certain extent limited by moral considerations. If "the best man" in the examination was of notoriously questionable character, no college would have felt bound to elect him. Nor is it superfluous under the circumstances to remind those concerned of what is in itself a truism, that, whether or not it may be applicable to this particular case (which is matter for argument), to accept the principle of religious equality pure and simple is incompatible with the maintenance of an Established Church. We may add, though it is not a point we intend to dwell upon, that Mr. Gladstone was manifestly right in cautioning the House against the impropriety of passing a resolution which could not have been regarded as less than a vote of want of confidence in the University Commissioners who are at present engaged in their delicate and not very easy task. It is in fact an open secret that the procedure was partly prompted by a suspicion of clerical tendencies in the Chairman of the Oxford Commission.

On the collateral question raised in Mr. Bryce's rider, with the full approval of Mr. Roundell, of throwing open the chairs of Hebrew and Ecclesiastical History, we do not propose to enter here at any length, as it stands on somewhat different grounds; but one or two observations may be made in passing on their method of treating it. These professorships are endowed with Christ Church canonries, from which they must of course be dissociated if laymen are to become eligible, and in that case the endowment ought clearly to be provided from some other source, and not, as Mr. Bryce suggested, by the unprecedented step of secularizing the canonries. It is true that many canonries were suppressed, wisely or unwisely, by the Cathedral Act of 1840, but the revenues were in every case reserved for ecclesiastical uses. Mr. Rogers indeed, who has, we believe, acquired the reputation at Oxford of a kind of academical Ishmael, seemed anxious to make a clean sweep of cathedral establishments altogether. This is the natural inference from his rather irrelevant remark that "they had a Dean and Chapter at Christ Church, and the presence of a Dean and Chapter in any place was a corrupting influence." As regards the main point—whether or not it is desirable to abolish all clerical, and therefore by implication all religious, restrictions on these professorships—Mr. Roundell's argument is certainly insufficient to prove it. To say that, "if the Professorship of Hebrew was a theological chair, because Hebrew was the language of Holy Scripture, the same thing would apply to the Professorship of Greek, because Greek was the language of the New Testament," sounds plausible, but is only a plausible fallacy. The Old Testament constitutes substantially the whole of Hebrew literature, and is therefore necessarily and invariably the one subject on which a Hebrew Professor lectures. The New Testament, if in one sense the most important part, is in quantity but an infinitesimal fraction of Greek literature, and is not in fact the subject on which a Greek professor is expected to lecture, or, so far as we are aware, ever does lecture. Moreover, Mr. Story Maskelyne's contention that theology, like other sciences, ought to be thrown open to unrestricted competition, must mean, if it means anything, that all the theological professorships should be secularized, not only those of Hebrew and Ecclesiastical History. As to the latter, no doubt it has to deal with facts which remain the same for an Anglican or an Agnostic. But that the treatment of these facts would inevitably and materially vary in the hands, say, of an Anglican or a Roman Catholic or a Presbyterian professor, or of one who shared the opinions of Gibbon, is too obvious to need a moment's discussion. The first and second, *e.g.*, would be pretty sure to recognize, and the third to deny or ignore, the apostolic origin of episcopacy; the second would maintain, and the first reject, the apostolic origin of the Roman primacy. On such points the fourth would perhaps be the most impartial critic, but he would challenge what all the three others were agreed in regarding as still more vital truths. Let us repeat that we are not here arguing for or against the proposal to secularize these two chairs; we are only insisting that its advocates have failed to prove that they are "not divinity professorships," and that their arguments really go far beyond the particular point at which they profess to be aiming. Of this Mr. Maskelyne, if not Mr. Bryce also, seemed to be quite aware.

And now to revert to the discussion of clerical restrictions on headships and fellowships. We have already observed that it involves other important considerations besides those on which Mr. Roundell and his supporters exclusively dwelt, and that it cannot be treated as a mere question of religious equality in competing for a money prize. The tutors of Oxford colleges are usually fellows or ex-fellows, and we have to consider whether it is not very desirable that some at least of them should be clergymen. The University Test Act, as Mr. Roundell admitted—and it is only fair to say that he showed no desire to alter this provision—directs that religious instruction and worship shall be maintained in the colleges. And, as the great body of the students frequenting these colleges belong to the Established Church, it follows that the religious worship and instruction provided must be Anglican. On this ground alone it has been argued very plausibly that one resident fellow at least in every College should always be in holy orders, though the mere letter of the technical obligation might be satisfied by appointing a chaplain or clerical outsider of some kind to conduct the chapel services. But the mere technical obligation is after all a very small part of the matter. The feeling of parents, which Mr. Roundell somewhat brusquely put aside, is decidedly in favour of clergymen educating their sons in this country, as elsewhere. And one fact which he alleged on his own side, and which we confess was new to us, goes far to prove it. It seems that of six leading public schools, Eton, Harrow, Winchester, Westminster, Rugby, and Charterhouse, the headmaster of Winchester only is required to be in holy orders. It therefore becomes a more significant fact that the headmasters of all these, as well as of the other great public schools, old and new, invariably, or almost invariably, are clergymen. Even in smaller and inferior schools the change from a clerical to a lay headmaster almost always indicates a decline in the reputation and character of the school. Nor is the explanation far to seek. Parents, as a rule, prefer entrusting their children to clerical educators, and the really flourishing schools are accordingly conducted on this principle. It rests, as Mr. Beresford Hope observed, on "the common sense of the religious people of England," who are hardly prepared in the matter of education to endorse Mr. Roundell's sweeping indictment of "religious tests as a qualification for important offices." Sir J. Mowbray dwelt on this aspect of the question, which to our apprehension is much the most important of any, though it barely escaped being ignored altogether by speakers on the opposite side. His words are worth quoting:—

> In the columns of the *Times* of that day a gentleman who was a strong Liberal in the University of Oxford said that a religious element must be accepted as an integral part of the education. Colleges were regarded as domestic institutions, and attendance at chapel formed a part of the daily life of the inmates. Indeed the honourable member for Grantham himself admitted that the feelings of parents ought to be respected, and certainly parents would not send their sons to colleges where a religious training was not provided. It was argued that there was no provision that the headmasters of schools should be in holy orders. But, in point of fact, they were in holy orders, and even the managers of new schools, if they wanted to induce parents to send their sons there, appointed clergymen to the office of head master.

We are not here concerned to defend this prejudice, if prejudice it is to be called, in favour of clerical educators; it is enough for our present purpose to point to its manifest existence and the probability of its permanence. But there is one obvious reason for attaching even more importance to this point in university than in school education. Boys at school are necessarily kept under a much stricter code of rules than can be enforced on the boys of larger growth—for boys in the main they still are—at Oxford and Cambridge; and therefore at the University external discipline requires all the more to be supplemented by a kindly and judicious exercise of personal or quasi-paternal influence, of authority in the classical sense of the word *auctoritas*. Is it or is it not the case, generally speaking, that this sort of influence over undergraduates is more likely both to be efficiently exercised and to be readily welcomed when it comes from a clerical monitor? We do not ourselves feel the slightest doubt as to the true reply.

It may be said that all this goes rather to show that colleges would be unwise in not taking care to have an appreciable contingent of clergymen on their staff than that it is necessary or worth while to secure by legislative provision the bare minimum of clerical fellowships sufficient for the exigencies of religious worship and instruction as contemplated by the Test Act. Nor can it be denied that the old arrangement which made ordination in most cases an indispensable condition for retaining a fellowship had a tendency to reduce a solemn religious act to a mere formal acceptance of obligations lightly or reluctantly undertaken, and thereby to degrade the clerical profession altogether. The objection, however, is one that will not bear pressing too far; it applies to many things besides clerical fellowships, such as family livings; and when the duties of a particular office are of a kind that can be most fitly discharged by a clergyman those who feel no vocation to clerical life are hardly the right persons to seek for it. It is not however our purpose to do what Parliament was very rightly advised to decline doing at Mr. Roundell's invitation. We have no wish to anticipate or to dictate the conclusions at which the University Commissioners may ultimately arrive on this matter. The long-established relations of the Colleges at Oxford and Cam-

bridge to the Church of England have been already so materially altered by recent legislation that it may be difficult or inexpedient to preserve the few remaining links by special enactment. On that point we are content for the present to await the judgment of the Commissioners. But, whatever may be the final decision on what is at best a mere matter of detail, we trust the Colleges themselves will not lose sight of the grave responsibility attaching to their discharge of the functions entrusted to them, which is rather increased than diminished by the greater measure of independence involved in every withdrawal of previous restrictions on their freedom of choice. It is their duty at all events, whether or not the method of discharging it be expressly enjoined by the Legislature, to provide not only for the maintenance of formal religious worship and instruction within their walls, but for the moral as well as the intellectual training of their undergraduate members generally. And this provision will not be adequately secured if fellowships and tutorships are treated as mere prizes to be awarded to the highest bidder in a competitive examination, with no regard to any religious considerations except that principle of absolute religious equality to which Mr. Lyulph Stanley assures us "the Liberal party as one man are intensely pledged." There is such a thing as *propter vitam vivendi perdere causas*, and religious equality, which is in itself a purely negative idea, may be so worked as to be not conservative but destructive of the principle and practice of religion.

MR. TOM TAYLOR.

SOME thirty or more years ago Mr. C. A. Bristed, an American gentleman, who had been at Yale College, came over to England, became a fellow-commoner of Trinity, Cambridge, and published an interesting and valuable book called *Five Years in an English University*. In the course of this volume he gave some sufficiently vivid sketches of the more prominent men of the day at Trinity with whom he was associated, heading his portraits with more or less transparent pseudonyms. Among these sketches, that of "Tom Travis"—in other words, of the late Mr. Tom Taylor—is both marked and attractive. Mr. Bristed made a supper at "Tom Travis's" serve as the occasion for giving a description of various persons, many of whom have since risen to eminence, in Mr. Tom Taylor's set; and began, as was fitting, with some words as to the host, which we need not apologize for quoting:—"At the head of the table sits our worthy 'coach,' Tom Travis." His fine presence, we are told, did not show to the best advantage in a loose shooting-coat, and his intellectual features were done injustice to by the quaint smoking-cap which he wore. But, "take him as he is, he is a rare fellow, with American versatility and English thoroughness. He knows nearly a dozen ancient and modern languages, more or less correctly; and, when you bring him out on Greek, he would astonish a room-full of Yankee Professors." His mathematics he had apparently got up because, according to the then system, he was obliged to do so in order to take honours; and it is well to remember that it was not every mind that was equal to the strain thus arbitrarily put upon it. He had a love for seeing character, which led him, amongst other things, to "go off among the gipsies, Borrow-fashion," and stay with them long enough to learn their language, then much less known than recent researches and experiences have made it. He was "independent in politics, and *juste milieu* in domestic matters, very fond of law, and equally so of theology—fonder of the theatre than either. Perhaps he will be a nominal barrister, and an actual writer for *Punch* and the magazines. . . . Perhaps some of his Liberal friends at 'the University we've got in town,' profanely called *Stinkomalee* by Oxonians and Cantabs, will make him Professor of Greek—or English, or Zincali; it's all the same to him—in that great institution. . . And, after all, there are worse parsons than he would make, yea, even in old Connecticut, for there is great earnestness in the man and benevolence extraordinary. . . . Any of these things Tom Travis may be (I ought not to omit the opinion of his *gyp*, who holds him in absolute veneration, that Mr. Travis will leave the College a Fellow and come back a Judge); at present he is a Bachelor Scholar and a coach of rising reputation." Later on Mr. Bristed, who was "coached" by Mr. Tom Taylor, writes:—"Travis certainly put more into me in seven months than I could have acquired by my own unassisted labours in two years; and of his exertions in my behalf I shall always retain a grateful memory."

The American writer's prophecy (which, however, may have been written after the event) as to the future of his popular "coach," whose death is now deplored by a wider circle than that of his friends and acquaintances, was curiously happy. Mr. Tom Taylor, who was born in 1817, the son of a Sunderland brewer and a German mother, left Glasgow University, where he gained three gold medals, to go in 1837 to Trinity, Cambridge. Here, although he found time to write for the *Independent*, to devote himself to practical studies of art, and to get up the private theatricals which were the forerunner of the "A.D.C.," he was elected, as his gyp foresaw, a Fellow of the College, after having gone out as a Junior Optime in the Mathematical and taken a First in the Classical Tripos. In 1843 he came to London, and became, in Mr. Bristed's words, a nominal barrister and an actual writer for *Punch*, and very likely also for the magazines. He also became a Professor, not of Greek or Zincali, but of English language and literature at University College, London, and held the post for two years. In 1850 he was appointed Assistant-Secretary of the Board of Health, and held various Government appointments until the office in which he was placed was abolished, and he consequently retired from the public service on a pension. "In the meantime," we learn from the *Times'* notice, "he had so far profited by the little leisure left to him as to win a prominent place among men of letters as a dramatist, critic, biographer, and humourist." The drama, to which in childhood he had shown a strong leaning, occupied a very large part of his attention, and he was probably known better to the public at large by his many successful plays than by his skilful and laborious exertions in other departments of literature. His earliest dramatic successes were associated with the names of Mr. and Mrs. Alfred Wigan, in whose house he lived for a time after leaving his chambers in the Temple; and he had plenty of ability and versatility to enable him to follow up a fortunate start, until he became one of the most successful and, in many respects, one of the most meritorious dramatists of the day. His knowledge of stage effect and of the requirements of dramatic construction was consummate; and his dialogue, never aiming at startling brilliancy, was always effective and to the purpose. Among his most successful dramas which have been lately performed may be mentioned *The Ticket-of-Leave Man*, a successful version of *Le Retour de Melun*; *Clancarty*, an admirably written and original play; and *Our American Cousin*, also an original piece, which has had a strange and in some ways not unhappy fortune. Written in the first instance with the American cousin as its central figure, it gradually became identified with Mr. Sothern's striking invention of Lord Dundreary, and the plot of the play, which is wanting neither in effect nor ingenuity, is now subordinated to the never stale humours put by Mr. Sothern into what was originally a trifling part. The list of Mr. Tom Taylor's dramatic successes is so long that it would be tedious to dwell upon all, even of the most prominent among them. *Plot and Passion*, however, *The Overland Route*, *Still Waters Run Deep*, and *To Parents and Guardians* may be specially mentioned. The two last-named pieces were originally produced by or for Mr. and Mrs. Alfred Wigan, and have lately been revived, the one for Mr. and Mrs. Kendal, the other for Mr. Arthur Cecil, with happy results.

It is probable, as we have hinted, that many people know the name of Mr. Tom Taylor as that of a successful playwriter who has given them much enjoyment, and do not know how varied and successful were his performances in other branches of the literary profession. His art criticism in the *Times* was a work both of labour and love, and, if it erred, erred always in the direction of indulgence rather than of severity. His biography of the unfortunate painter Haydon not only treated a difficult subject with much tact, but will remain a work of much interest and value. His dramatic criticism was both learned and practical, and an excellent instance of its merit is to be found in one of the last articles of the kind which he wrote—the review of *As You Like It*, published not long since in the columns of *Punch*. He was a contributor to *Punch* from his arrival in London up to the date of his death, and succeeded the late Mr. Shirley Brooks as its editor. He occasionally indulged his early love of acting by appearing in amateur or semi-amateur performances; and a year ago he gave what is said to have been an excellent performance of Adam in *As You Like It*, on the occasion of the Calvert memorial performance at Manchester. It has been justly said, except in one strangely cynical and ill-bred notice of his career, that Mr. Tom Taylor's place in the literature of our day will be hardly filled. It remains only to add that the attractive and sterling qualities dwelt upon by his American pupil at Cambridge remained with him throughout a hard-working and well-spent life.

MILITARY EDUCATION.

WE have of late heard comparatively little of the carping which was once so common at the better education now required of our officers, and we may probably hope to hear less and less of it as time goes on. In truth, the sort of criticism generally advanced on the subject is probably often not answered because it does not need answering. If, for example, an officer who has passed through the Staff College happens not to be a good rider, the case is cited as if proving that the Staff College is a useless, if not positively harmful, institution, and the course pursued there by no means the proper sort of test for determining the selection of Staff officers. Now it does not necessarily follow that the best officers of the army will go to the Staff College, although the presumption is a strong one that they will do so; there may be causes at work to keep them away, and the system has yet to be discovered which shall unerringly bring to the front the best men in any profession, when, as is the case with the army during peace-time, the opportunity is not afforded for the full exercise of ability. It is only active service which can show who are really the best soldiers. But this, at least, the present system ensures—that the men chosen for the Staff shall have given evidence of industry and fondness for their profession by undergoing a long and laborious course of preparation; they must be men above the average in respect of intelligence, or they would not have gained admission in the first instance; and if now and then a man passes through

who is not so good a rider or so physically strong as is desirable, this is not the fault of the system, but of commanding officers, who are weak enough to recommend improper candidates for admission. But the merits of a system should be judged, not by reference to an ideal standard which in practice cannot be attained, but by comparison with what it has replaced. The champions of the good old times forget that, if the guarantee for physical efficiency is not quite complete at present, there was none at all under the old. When staff appointments were a matter of simple patronage, men incompetent in this respect, as well as in every other, might be, and frequently were, appointed to the staff. In the Indian army staff appointments have always been given by selection subject to no test—that is, by interest and favour, or in other words, by simple jobbing; and in no army in the world used there to be a larger proportion of incompetent staff officers, assistant quarter-master-generals who could not survey, and assistant adjutant-generals who could not ride. Things have been better of late, because recent commanders-in-chief have shown a stronger sense of responsibility in their patronage than was usual before. But even now the practice is too common, when once a man gets on the staff, to keep him there for the rest of his service, long after he has begun to deteriorate, and when he has from disuse lost that knowledge of the requirements of the army which can only be gained by personal contact with the troops. The Indian practice, in fact, has all the faults of the French staff corps system, in the staff officers being a body apart from the rest of the army, without its merit of supplying a picked article in the first instance. It may be added that the Staff College system has by degrees undergone a useful change in the direction of giving more attention to the practical parts of the profession and less to abstract science than was the case at the outset, and it is now probably as good a course of the kind as could be devised.

It is rather in our military education at an earlier stage that there is a call for further reform. A striking point about the present arrangement is the difference between the system pursued at Woolwich, for the education of artillery and engineer officers, and that now established at Sandhurst, where the greater part of the line and cavalry receive their training. The Woolwich course offers little that is open to criticism; it extends over two years and a half, and includes as many subjects as the time available will admit of being taught; but the question at once arises why a degree of education which is considered necessary for the Engineers and Artillery should not be deemed equally necessary for the rest of the army. It is no answer to say that the former are *par excellence* the scientific services. The ordinary duties of an engineer officer call rather for practical skill than scientific attainments. So, too, provided there are a sufficiency of artillery officers qualified to deal with the scientific problems that arise in connexion with artillery practice—and from among so large a body these will always be forthcoming—a very moderate amount of scientific knowledge will suffice for the mass of the regiment. We are not objecting, however, to the Woolwich course being more strictly of a more scientific kind than that given at Sandhurst, or proposing that mathematics, for example, should be taught at the latter place; although it is certainly a pity that the young men who gain admission to Sandhurst by their proficiency in mathematics should not be allowed the opportunity of developing their taste in that line, and should be obliged to give up the study whether they will or not. Our objection is that a great deal of what may be strictly termed the practical part of the profession should be altogether neglected at that place. As regards the study of modern languages, for example, there is something on the face of it absurd in the comparison between the attention given to these at Woolwich, and the utter neglect of them at Sandhurst. The Sandhurst cadet, indeed, is required to pass a qualifying examination in French or German as a condition of admission. But having obtained the very elementary knowledge of the language necessary for this purpose, these subjects are henceforth dropped, just at the point when further instruction in them would be particularly useful. There would be a show of reason for this if the Engineers and Artillery got all the Staff appointments of the army; but since, as a matter of fact, they are almost entirely excluded from these, the inference is rather the other way—the officers who furnish the staff ought to get the teaching. So likewise as regards military history, absolutely no reason can be assigned why the Ordnance corps alone are to learn how campaigns have been won and armies led. They can never hope to lead an army, except in India. If there is any branch of the army for which such a study is unnecessary, it should be these services and not the infantry.

The truth is that the Sandhurst course is rather one of training than of education in the proper sense of the term. It comprises drill, gymnastics, a little surveying, the outlines of military law and administration, riding, and some practice in throwing up field works. All these are very useful things in their way; but the question seems to be whether, considering the limited time available, this is the best use to put it to. It is in the time given that the difference in the training of the two classes of cadets is most conspicuous. While at Woolwich the course extends over two years and a half, at Sandhurst it is brought within the compass of a year, or, if the very liberal vacations are taken into account, about eight months. This extreme brevity of the Sandhurst course is a result of the condition, introduced two or three years ago, that all officers, except the minority who get their commissions through the militia, should pass through the Royal Military College. Now as Sandhurst holds only three hundred cadets, and as nearly that number are wanted to fill vacancies every year, it follows that the stay at Sandhurst must be limited to one year. Indeed it has happened that when the regimental vacancies are in excess of the ordinary average of three hundred a year, it has been necessary to pass the batches through the College after a course of only half the prescribed time. It need hardly be said that in a six-months' course only the merest smattering of instruction of any sort can be given; in fact, the instructors have hardly time to learn their pupils' names.

This being the state of the case; as Sandhurst is not readily capable of expansion, and as there would be great objections to establishing a second military college, while there is no sound reason why the Infantry should be less thoroughly educated than the Artillery and Engineers, it certainly appears desirable that the present system should be reconsidered. One solution of the difficulty would be to alter the rule which sends all officers, save those who enter the army through the militia, to Sandhurst; to take in a smaller number there, and to keep them there longer; and to educate those who are received more thoroughly. There is no part of the present Sandhurst course which a young officer might not acquire almost equally well after he joins his regiment or under a garrison instructor. By a rearrangement of this sort the Sandhurst course might be made as complete and efficient as that established at Woolwich, and a part of the officers of the army at least might be thoroughly trained for their profession. It would be necessary to make up in some way to those who pass through the college for the loss of time spent there, as compared with those who pass into the army direct; but it should not be difficult to arrange this, say by letting the time at Sandhurst count as service, or by giving a certain number of lieutenancies to be competed for, or in other ways that will readily suggest themselves. It must be further remarked that even the very limited time now available at Sandhurst does not seem to be altogether turned to the best account. In many respects, indeed, the present system is a great improvement on the various experimental systems which it has succeeded. The tone of the place is good; the cadets are healthy, robust, and well-conducted, and appear to show a fair degree of zeal and interest in the different subjects they are taught. But, although a certain amount of reaction in favour of leisure and out-door amusement may be expected, and even desirable, after the course of grinding which so many of them have just gone through at their respective crammers, where they have been losing the benefit of all that was wholesome and hearty in their previous school-life; still, a course of study which is ended each day by about half-past two o'clock, and leaves the cadet nothing to do from that time until he goes to bed, except perhaps a little gymnastics or riding, and such occupation as is afforded by partaking of a comfortable mess dinner, can hardly be pronounced very exacting or even complete. There certainly appears something incongruous, to say the least, in the arrangement by which the students at one military college are required to work from morning to night, while at the other they enter by anticipation on the ease and comparative idleness of regimental life. The only objection which the cadets themselves ever make to the present Sandhurst system is that they find the time hangs a little heavily on their hands, from there being nothing to do of an afternoon or evening, a criticism which is curiously suggestive of the sort of change needed. An hour or two of these long afternoons and evenings spent in reading French or German military history in French or German would certainly not be time thrown away.

HAYMAKING.

THE agriculturist who in the bitterness of his soul defined hay as a great deal of beer and labour superadded to grass, spoke words which must appeal to the sympathy of many country gentlemen at this season of the year. There is something about the very name of hay which chills the heart of amateur farmers, for it is associated with discomfort, loss of temper, and loss of money; and few words have been oftener accompanied by those strong expletives for which the fine old English gentleman is so justly famous.

There have been wise men who have set their faces against making their own hay. Why, said they, should a man make his hay at home any more than his boots or his trousers? and they have even gone so far as to maintain that home-made hay is generally as bad as home-made law. So long as they kept their faith they found country life easy and agreeable; but now and then they have been known to waver from their admirable creed, and to taste the forbidden fruits of the hayfield. Their gardener or factotum has persuaded them that, after all, it would be a great economy to "take a crop" off a certain pasture or park; that it would yield so many tons of the finest upland hay, and would absolutely benefit the quality of the grass for the future. If the master objects that the risk of a wet harvest would be serious, the servant answers that, with ordinary care, it would be easy to "pick three or four fine days in July," when, by putting on all available hands, the whole thing might be knocked off without delay. The faithful servant does not wish to persuade his master to do anything he does not like, but when he sees a thing that "wants doing" he considers it his duty to speak. And so, in a weak moment, the master gives his consent, and some dozen acres of land are told off for hay. The troubles of the future hayfield may be said to begin in the autumn, or at any rate

in the early winter. If it is suggested that it might be well to dig more manure into certain flower beds, the factotum replies that he must economize that valuable compound as much as possible, lest it should run short for the hayfield. At the first hard frost, when all hands are wanted to sweep the pool for the skaters, a strong remonstrance is made because "the men are carting muck for the hayfield." In the spring it becomes necessary to buy more hay for the cows, because there is so little grass. Why is there so little grass? Because the cattle have been taken out of the field intended for hay, and consequently there is so much less available pasturage. Although a good deal of stable-yard manure has already been put on the precious enclosure destined for hay, it is recommended that it should be "artificialled," as the cost of the bone and superphosphate will be trebly repaid by the extra growth of grass which it will produce. Several sacks of this compound are purchased, and for some days after their contents have been thrown over the field a vile smell makes its neighbourhood unendurable. If, as is often the case, the hayfield is situated beneath the drawing-room or dining-room windows, the full flavour of the patent artificial manure is duly appreciated. Many minor cares and troubles in connexion with the hayfield soon present themselves. There are some weak places in the fence, and several men have been employed for many days in repairing them. "Missus's ducks" are making a path through a corner of the growing grass, and "no horses will eat it after ducks have been messing in it." Some arrangement has, therefore, to be made as to these ducks, and the lady says that she will willingly have her favourites killed if it will please her husband, but that so long as she keeps them, "they must go to the water, poor things!" Or it is suddenly remembered that the boys' cricket-ground is in the middle of the hayfield, and there is no other flat piece of grass land about the place; but the only consolation offered to the lads is that it cannot be helped. The growth of the precious grass seems wonderfully slow. Want of rain at a critical period prevents it from making any apparent progress, and excess of moisture at another time makes it grow rank. Kind friends point out what a pity it is that the thistles were not cut at the proper time, as the large patches in some parts of the field will make the hay unpalatable to anything but a donkey.

On large properties a bailiff usually superintends the hay, but where there is no home farm, the paddocks are generally under the charge of the head gardener. As the hay season approaches, this functionary keeps replying to his master's inquiries by stating that the hay is not yet ready for cutting. A friend, however, calls and remarks that he has just carried his own hay "without a drop of rain," and inquires why his host has not also taken advantage of the unusually dry weather. The gardener is sent for and ordered to begin the hay at once. He urges further delay, observing that he has arranged with some mowers that they shall begin to cut it on that day week. After a great deal of unpleasant discussion, it is eventually settled that the important work is to be begun "the day after to-morrow," if mowers can be procured. As these men have to be pressed into the service at short notice, they demand higher wages than the mowers with whom the previous arrangement had been made; but at last the crop is cut, and the haymakers are busily engaged in throwing the grass about to persuade it to become hay. Every hand about the place is sent into the hayfield. The gardeners, the men from the stables, and even the footmen are enlisted for the service. There is often a wrangle with the butler about the diversion of his forces from their legitimate duties. His objections are met with the argument that the hay season is an exceptional occurrence, and that, under the circumstances, he ought to endeavour to be obliging. He grudgingly consents because he would "do anything to please his employer"—butlers no longer have masters—but he mutters a great deal about "his place" and the difficulties of "washing up." It turns out that the mistress of the house has thoughtfully invited a large party of neighbours to luncheon, and has promised them that they shall afterwards play lawn-tennis, and have tea and strawberries in the hayfield—an arrangement obviously conducive to the furtherance of the hay harvest and the pacification of the butler. During the happy time of haymaking it is almost impossible to get a servant to do anything. The carriage cannot be taken out, because the grooms are in the hayfield. The garden looks wretched, because the gardeners cannot leave the hay to pluck a weed or to mow the turf. They have not even time to gather strawberries or vegetables sufficient for the house. The drawing-room and hall look miserable, because the gardener cannot spare a moment to attend to their decoration with flowers. The lawn-tennis ground is unusable, because the grass upon it is several inches long. The only amusement remaining is to tap the barometer and speculate on the probability of rain. At last the gardener says that the hay is ready for carrying. Unfortunately, the person most concerned in its after use is of the contrary opinion. Hay carried in such a state will never, says the stud groom, be fit for hunters. The gardener "hopes he knows his business"; but the glass is still rising, and the master determines to give the hay one day more. Towards evening it becomes oppressively hot, and the rumbling of distant thunder warns the haymakers that there is many a slip betwixt the haycock and the stack. In an hour or two a heavy storm bursts over the neighbourhood, sheets of rain deluge the hayfield, and, when there is a slight cessation in the fury of the elements, the cocks are found to be beaten down and sodden. The gardener says, "I told you so"; but the groom lifts the upper half of a haycock, and shows that the lower part is still dry. The next morning the hay has to be re-made, and in the afternoon another storm recurs at about the same hour as that of the day before. Thunderstorms often follow each other for several consecutive days, and broken weather not unfrequently succeeds them. The hay is therefore constantly made and re-made, during each of which operations it loses some of its virtue. Now perhaps it is the groom who wishes it carried, and the gardener who wishes for delay. This sort of thing sometimes goes on for three weeks or even a month, the hay meanwhile losing its colour and deteriorating in quality. Its owner is miserable. He can enjoy nothing, and he feels as if it would be wrong if he were able to enjoy anything. Is not his hay out, and what business has the man whose hay is out to be happy? The idea is rapidly developing itself in his mind that the produce of his hayfield will be fit for nothing but manure, and he is weary of the sight of his discoloured haycocks.

We have perhaps said enough to prove that the owner of a hayfield does not live a life of ease and tranquillity during the harvest; but with his haymakers it is far otherwise. The wetter the weather the better for them. They must be retained at haymaking wages until the harvest is finished, be the weather wet or dry. Each time that the hay has to be re-made, the beer barrel again begins to flow. What can be better for them than that a fine morning should induce the gardener to set them to work to turn over the hay, and that, while they are drinking their first edition of beer, a friendly shower should suspend harvest operations for an hour or two? Even when the long-wished-for carrying day at length arrives, it is not all smooth for the master. It will be lucky if there is not a row between the butler and the gardener about the amount of beer required, between the gardener and the groom about the fitness of the hay for carrying, or between the master and some or all of these functionaries about some subject or other connected with the all-absorbing hay. Worst of all, it sometimes happens that a valuable servant, who has been remarkable for his sobriety, gets drunk on these occasions. The crowning catastrophe is the harvest supper, after which it is likely enough that there will be a fight, a flirtation—with serious consequences—or an unseemly disturbance.

Occasionally, but rarely, the crop is got in under favourable conditions, when the chances are that it has been so light, or so sunburnt, that it was scarcely worth carrying; or perhaps it happens that hay is so cheap and plentiful that it is almost provoking that one does not want to buy. There are many worries in country life; but we know nothing which is so pre-eminent for producing loss of temper, general inconvenience to masters, and wrangles among servants, as the institution of haymaking.

YACHT-RACING.

IN an article on racing yachts which appeared in the *Saturday Review* on the 10th of April last, we mentioned two large cutters which were being built, and pointed out that no small interest would attach to their performances, inasmuch as they might be considered to represent respectively the Clyde and the Solent, and also because one of them might be considered to represent the latest ideas of naval architects, being constructed of steel, while the other represented the old school, being constructed of wood. Both these vessels have now appeared, and the steel craft, which sailed in the first races of the season, has achieved a series of brilliant victories, and has already attracted more attention than has been given to any racing vessel for a very considerable period. The wooden cutter was much more tardy in beginning her racing career; but, from what she has quite recently done, it seems possible that she may be a not unworthy rival of the other, and may prove that, for such peculiar craft as racing yachts, the old-fashioned material is as good as the mild steel, about which naval constructors and engineers are just now so enthusiastic. The vessel which is fashioned of this metal is, as we need hardly inform our readers, the *Vanduara*, built at a Clyde yard from the designs of Mr. G. L. Watson, a naval architect. Very remarkable, certainly, were her performances during the first five weeks of the present season. She beat the two fine cutters opposed to her in the Thames matches, was first by a long way in the race for all rigs to Harwich, and won there. These were no trifling successes; but it happened that all these races were sailed in light winds. With ships, as with men, it is generally thought that one kind of excellence is incompatible with another, and after the *Vanduara's* successes there were prophecies that, though good in smooth water, she would prove fit for very little in a breeze and a sea. Never were prophecies more completely falsified. In the Dover cutter match, the greater part of which was sailed in a smart breeze, the *Vanduara* beat the *Formosa* thoroughly. In the match for all rigs off Ostend, when there was a good deal of wind and a nasty sea, she was only a few seconds behind the winner. In the race back, when it blew really hard, she was victorious; and, finally, in a long race from Dover to Cowes, sailed in strong wind, she beat by a great deal the *Egeria* and *Latona*, both of which much exceed her in size. Clearly, therefore, the *Vanduara* is no fair-weather vessel, but one which excels even more in strong breezes than in light ones, and naturally enough she has become rapidly famous, and her designer has been justly praised for his skill. It may, however, be observed, without any attempt to depreciate this admirable racing yacht, that some of those who have written about her might have remembered a certain Shakspearian saying with advantage, and not have attempted to exaggerate

her remarkable merits. Unfortunately national enthusiasm has carried her admirers away, and in some of the Scotch papers there has been very silly bragging about the wonderful cutter, the success of which has proved, as some two or three thousand other facts have done, the innate superiority of the Scotch mind over the English. Moved apparently by the delight which has been thus shown, a writer in the *Globe* last week became ecstatic on the subject of the *Vanduara*, and described her as "a yacht second to none of her size in the world." The writer's competence to fix the *status* of a racing yacht in this delightfully broad manner was shown by the fact that in the course of his observations he spoke of "the hideous *Jullanar*, with her protruding bow and raking sternpost." It so happens that the *Jullanar* differs from the great majority of racing vessels in having an upright sternpost, and that this is one of the most marked peculiarities in her design. Very clearly the author of the notice in the *Globe* was writing on a subject of which he was profoundly ignorant; and it might have been thought that the praise of such a critic would be taken by those who had some knowledge of yachts for what it was worth. The appearance of his effusion, however, was altogether too much for Mr. P. M. Watson, the brother of Mr. G. L. Watson, and he rushed into print with a boastful letter, in which he hinted that, kind as the writer in the *Globe* had been, he had scarcely been laudatory enough, and at the same time accepted the title which the acute nautical critic had bestowed on the vessel. After such bunkum as this, it was not altogether unsatisfactory to learn that on the first occasion when there was an opportunity of really testing the comparative merits of the *Vanduara* and the *Samœna*, the wooden cutter which has been mentioned above, the latter very thoroughly defeated the former.

It is much to be regretted that the *Samœna* did not appear sooner, as her participation in the early matches would have given them an altogether exceptional interest. As it was, they were by no means bad or feebly contested races. In the cutter races which have been spoken of, the *Vanduara* had for antagonists the *Formosa* and *Cuckoo*. The first was sailed in what seamen love to call a "soldier's wind"—that is, wind which is fair both ways, and, in a reaching race, the Scotch craft fairly beat her antagonists and came in well ahead of both. In the second contest the conditions were much the same; but this time the *Formosa* succeeded in heading her rival, and passed the mark-boat a few seconds before her. The *Vanduara* was winner by time; but she was disqualified on the ground of having made an irregular start. The third cutter race, sailed on June 5, was more interesting than either of the other two, as it involved a long beat to windward, and showed, therefore, what the new yacht could do on a cutter's best point of sailing. The wind was well on the quarter for the greater part of the outward run, and with all possible canvas set, the three vessels presented a very beautiful sight as they tore down the river. It was not a little curious to note the difference between the wave raised by the *Vanduara's* bow and the waves raised by the bows of the other two yachts. Coming back, the wind was dead foul, and a strong lee-going tide was running, so that there could hardly be a better opportunity of testing the comparative powers of the trio in smooth-water sailing. The *Vanduara* proved her superiority, soon getting to windward of the *Formosa*, and roundly beating both her and the *Cuckoo*. It is to be observed, however, that neither in these nor in subsequent races has the *Formosa* seemed to sail as she has done in her two previous seasons, and that very possibly in some of the later matches she will redeem a reputation which has not been lightly earned.

Next after the contests just mentioned came the race for all rigs from Southend to Harwich, which took place on June 12. Seldom has a more unsatisfactory race been sailed. The start was utterly mismanaged; and the consequence of this bungling was that some vessels went off without the slightest regard to the Club regulations, while others which obeyed them were, in consequence of doing so, placed in an almost hopeless position from the beginning of the day. The wind, which at times almost entirely died away, was very uncertain, so that, owing to mismanagement and mischance combined, there was little significance in the position of most of the vessels as they neared Harwich harbour. The *Vanduara* won by more than an hour; but, though she sailed admirably, there can be little doubt that she was favoured by the wind. Next to the Scotch yacht came the *Latona*, which took the second prize. The schooners engaged were the *Miranda*, *Fiona*, and the *Pantomime*, which reappeared after a long absence from English racing fleets. She succeeded in beating the redoubtable *Miranda*, but her victory meant little or nothing, as, in consequence of having obeyed the regulations, the *Miranda* had started a long way astern of her. The contests at Harwich were of little interest owing to light winds and calms, but the sail back to Southend was a fine one, as there was a fairly good breeze. The most remarkable feature in this race was the sailing of the *Miranda*, which in a brilliant fashion avenged the slight put upon her a few days previously. Over a considerable portion of the course the sail was a more or less free reach, and during this the larger *Australia* got well away from the Wivenhoe schooner; but the latter was always within her time, and at the last when it was necessary for the yachts to sail as near the wind as they could, the *Miranda* gained and weathered rapidly. Just before passing the mark-boat the *Australia* touched the ground and hung for a short space; but this accident did not affect the result of the race, as, had it not happened, the *Miranda* must still have taken the first prize. Next to these two schooners were the *Latona*, *Fiona*, and *Pantomime*, the last of which, like the *Australia*, got aground. It should be said that in neither case was the captain at all to blame. The mark-boat had been placed absurdly near the pier by some ingenious person who was apparently under the impression that the race was for 5-ton craft. When the expense which may be thrown upon the owner of a large yacht by the grounding of his vessel is considered, it seems astonishing that such a mistake should be permitted. If there was no one at Southend who had sufficient knowledge to moor a mark-boat, nothing could have been easier than to send to some other place on the river for a waterman who had seen a few yacht races and could do what was required.

In the schooner matches of the New Thames and Royal Thames Clubs, sailed on the 19th and 21st of June, the *Miranda* defeated first the *Fiona* and then the *Egeria*. Both these races were sailed in light breezes; but on June 23rd, when the Channel match from the Nore to Dover took place, the wind had more strength. In this race all the honours fell to the *Latona* and *Miranda*. The former led during the whole day, and won the Queen's Cup. The other kept close to her throughout, sailing admirably, and in the latter part of the race, when the wind was foul, there was the remarkable sight of a schooner holding her own well with a yawl much exceeding her in tonnage in a steady beat to windward. Indeed, in this her fourth season, the *Miranda* seems to be sailing better than ever, and her performances have been in some respects as remarkable as those of the steel *Vanduara*. After the race from the Nore came the regatta of the Cinque Ports Yacht Club, which is, as we need hardly say, one of the most deservedly popular of the whole racing season. This year a fine fleet assembled in the bay, and, with weather happily favourable, the principal race was one of the finest that have been sailed in any waters for some time past. It was of course preceded by the cutter, yawl, and schooner matches. In the first the *Vanduara* was victorious, completely vanquishing the *Formosa*, her only antagonist. In the other two, sailed on June 26th, the *Florinda* and *Miranda* were successful. The schooner race was marked by the reappearance of the famous *Gwendolin*, which for some time past had not engaged in any contest. It cannot be said that on this occasion the celebrated schooner much distinguished herself, as in the second round she was sailed hull down by the *Miranda*, and retired from the match. She was destined, however, shortly to redeem her ancient fame. Towards the conclusion of this race the *Miranda*, sailing apparently without any wind at all, glided past the *Florinda* and round the South Sand-Head Lightship in a manner that seemed almost inexplicable. Very different from the calm weather in which this match was finished was that of the morning of the 28th, when the Boulogne race was sailed. There was a strong south-westerly wind, and some sea in the Channel. Eleven vessels started, and for a time the *Miranda* led, the *Latona* and *Egeria* being close to her. Gradually, however, the *Gwendolin*, which had been very unlucky in starting, made her way through the whole fleet, and at Boulogne she was well ahead of everything else. On the run back she showed wonderful speed, but unfortunately when she was some two or three miles from Dover she lost a man overboard, and, as of course she stopped to look for him, was passed by the others. At the time when this accident happened the *Gwendolin* was a good distance ahead of the rest, but not so far as has been stated in some accounts of the race which have appeared. It must be remembered, too, that the other schooners, sailing together somewhat jealously, had got off their course, and thereby greatly aided the *Gwendolin*. Had they taken a better line, they would have been much nearer to her, and possibly she would not have had her time clear at the moment when the accident happened. The *Latona* was the first vessel in, followed by the *Egeria*, and then by the *Miranda*, which took the first prize by time, the *Florinda* taking the second, and the *Vanduara* the third. The pace of the leading yachts over the whole course had been, on an average, about fourteen miles an hour, and probably the race was one of the fastest ever sailed; but the enjoyment of this splendid contest was completely marred by the fact that the unfortunate seaman who had fallen overboard from the *Gwendolin* was not recovered, though every possible effort was made to save him.

On the following day, June 29th, the match from Dover to Ostend took place. With a fair wind, the *Miranda* led grandly from one mark-boat to the other, and took the first prize. Some of the competing yachts lost a good deal of ground by an awkward foul at the start. The race off Ostend was sailed in a smart breeze, which freshened as the day wore on, and raised a nasty short sea. Out of seven starters only three—the *Latona*, the *Vanduara*, and the *Miranda*—held out to the end, and they passed the mark-boat in the above order, the yawl and cutter being very close together. There was no club race back, but the yacht-owners organized one amongst themselves, and this was won in magnificent style by the *Vanduara*, which in a considerable sea left everything else far to leeward of her. She achieved an equally brilliant success on the 3rd and 4th of the present month when in a long beat, for the most part against a strong breeze, from Dover to Cowes she sailed out of sight of the *Egeria* and *Latona*, and arrived far ahead of them. Shortly after this her victorious career met with the check which has been mentioned. Going north, she met the *Samœna* twice at the Northern Yacht Club Regatta. On the first occasion the *Vanduara* won, but the wind was so uncertain that the result of the race was almost entirely due to chance. In the second match,

sailed in a true wind, the *Samœna* thoroughly beat the steel vessel, getting a good lead by the end of the first round, keeping it on every point of sailing, and passing the mark-boat six minutes ahead of the other. There seems to be some reason for supposing that the *Vanduara* was suffering from the constant complaint of iron and steel ships—a foul skin—and that she was not sailing her best, or nearly her best. Possibly, when she has been scraped, she will be more than a match for the *Samœna*; but then it must be remembered that the necessity for constant docking is a very serious drawback to a racing yacht, and that admiration for this vessel's achievements is of necessity somewhat tempered by the fact that she requires frequent manipulation. If there is to be any more puffing of the *Vanduara*, it should in fairness be mentioned as a slight drawback to the merits of the yacht which is "second, &c.," that after a few weeks in the water she must be either docked or beaten.

PROSPECTS OF TRADE.

WHEN commenting last autumn on the sudden and unexpected activity which manifested itself in the markets alike for commodities and for securities, we observed that the experiment which we were about to witness was economically of the most interesting kind. It was whether a revival of trade is possible, not only without a good harvest, but in spite of a succession of very bad harvests? A few years ago nobody would have thought such a thing possible. It was a settled conviction that prosperity could come only from an abundant production of the fruits of the earth; and the conviction was well founded. But the past generation has wrought a complete revolution in the economic condition of the country. Free trade, railway construction, the application of steam to navigation, the electric telegraph, the settlement of vast regions in America and Australia, the subjection, pacification, and unification of India, the piercing of the Isthmus of Suez, the development of industry, and the accumulation of wealth, have contributed, each in its degree, to render us less and less dependent upon our own soil for our food, to break down the isolation of countries, and to make the whole commercial world more and more nearly one economic community. False conceptions of national greatness, unwise legislation, imperfect industrial organization, and the backwardness of mechanical invention still interpose many and serious obstacles between produce and its best markets; yet the identification of the interests of all nations has gone far enough to make the question possible, Can there be a revival of trade without a good home harvest? And many conditions were present last year which so favoured a revival as naturally to suggest the question. It was pointed out at the time by Mr. Giffen, and it may now be accepted as proved, that the long depression, with its attendant fall of prices, and the paralysis of credit that followed the Glasgow failure, had diminished production below the requirements of current consumption. Coal and iron masters limited their output, manufacturers restricted their operations, wholesale dealers allowed their stocks to run down. Each was anxious to lock up his money as little as possible, and experimented, therefore, to ascertain with how small a stock he could go on. The result was that stocks ran too low, and an increase of production became necessary. At existing prices, however, the increase would not pay, and consequently an improvement of the markets was indispensable to secure the augmented supply needed. Just when people began to discover that this was really so, another cause came into operation, producing an effect that astonished everybody. With the exception, perhaps, of the South American countries, the United States had suffered most severely from the long depression, and in consequence an unusually large proportion of the population was driven, through want of work in the towns, to the cultivation of the land. Fortunately for all parties, the last three seasons, which were so disastrous in Europe, were exceptionally favourable in the United States. An unprecedentedly large area was tilled because of the breakdown of industrial and manufacturing enterprise; and there was an unprecedentedly bountiful return through the goodness of the seasons. Thus, out of the superabundance of American crops, Europe was fed, and Europe's gold in return was poured into the pockets of the American people. Continued for three successive years, this lucrative exchange restored prosperity to the United States, and once more they resumed the projects of railway building which had been interrupted by the crash of 1873. After a while, this necessitated the buying of English iron and steel on a vast scale; and this buying was accompanied by large purchases of other commodities. The necessity for replenishing home stocks and the eager American demand, coming together, caused that outburst of activity which signalized the autumn and winter. This in its turn led to much wild speculation, which collapsed in the spring. What has been the course of trade since, and what is the present prospect?

This question finds its answer in the Board of Trade returns for last month, which, it will be borne in mind, also give the figures for the last six months, and therefore cover a period beginning when the American purchases were already slackening, and running through the interruption to business of the dissolution and the elections, the breakdown of the recent speculation, and the consequent fall of prices. For the whole half-year we find that imports and exports have increased, as compared with the corresponding period of last year, almost in the same proportion—22 per cent. in the case of the imports, and 21 per cent. in that of the exports. This growth, *pari passu*, of both sides of the account is highly satisfactory. There is, as we know, a school of reasoners which looks with scant favour upon the expansion of imports as a squandering of the national substance. Enlightened economists have no sympathy with this view. But we may point out nevertheless that a large part of the increase of the imports is in the raw materials of manufactures, such as cotton, flax, hemp, hides, silk, wood, and wool. There is also, of course, a large increase in the import of articles of food. After so many bad seasons, decrease, or even stationariness, in these items would afford cause for serious uneasiness respecting the condition of the country, as indicating a real decline in the purchasing power of the masses of the people. Happily there is no such symptom. On the contrary, there is an increase of 186,000 cwt. in the quantity of wheat imported during the six months, and of 2,396,000*l*. in the value. There is also an increase in the import of barley, as was to have been expected from the badness of the last barley harvest. And generally we may say that the increase in the import of articles of food was over 9½ millions in value. Still the distinctive feature of the imports is increase in the raw materials of manufacture; and this increase is more marked in the single month of June than in the entire six months. Thus in June alone the imports of raw cotton exceeded those of June last year by 51½ per cent. in quantity and 56 per cent. in value; flax 54 per cent. and 80 per cent. respectively; wool 95 per cent. and 106 per cent. In these instances it will be seen that the increase in value is, with one exception, not much greater than that in quantity, showing that rise of price has little to do with the augmentation on which we are commenting. It is further to be remarked that the greater relative increase in the import of the raw materials of manufacture in June than in the six months proves that manufacturers are fairly prosperous, and are looking forward to still better times. Turning now to the exports, as to which we have heard such doleful complaints of late years, we find an increase for the six months of 21 per cent., and for June of about 26 per cent., again showing that June was ahead of the average of the half-year. The expansion still continues to be very largely in steel and iron, and to be due to American buying. Thus for the half-year the increase in the exports of pig-iron to the United States is actually greater than the increase in the total exports; but for June the total exports have risen 306,000 tons, and those to the United States only 190,000 tons. American purchases, that is, still count for more than half the increase; but there is expansion elsewhere, as in the trade to Russia, Germany, Holland, and Belgium. In railroad iron the United States count for less, British America, British India, and Australia having enormously augmented their purchases last month. The increase in the export of cotton piece goods is, however, larger than that even in iron, amounting to about 28 per cent. in quantity. Under this head also the United States have taken more than twice as much as in June last year; but our chief customers were India, China, Turkey, Brazil, and Egypt. There was likewise a large expansion in the exports of wool and woollens, with a smaller increase in silk manufactures, coal, oil-seed, and alkalies.

The inference to be drawn from these facts is clear enough. The raw-material-producing countries have recovered from the collapse of 1873; the United States never were more prosperous; British America is improving; India is shaking off the effects of famine; Australia likewise is doing better; the South American States are distracted by war and attempts at revolution, but they also have shared in the revival. The return to prosperity of these countries has enabled them once more to buy largely of us. But Europe is still suffering from a succession of bad seasons, from bloated armaments, protective tariffs, and political apprehensions. At home, a part of Ireland is famine-stricken, and over the whole United Kingdom the agricultural interest is suffering seriously. We need, therefore, for assured improvement in trade abundant harvests throughout Europe, restored confidence, and some degree of prosperity to the landed interest. With the exception of Russia, the principal countries of the Continent have a fair prospect, as is also the case at home. But more settled weather is required, especially more sunshine. If the harvests turn out well, wheat will probably be cheaper that it has been for many years, and consequently the cost of living to the working classes will be very low, which is always favourable to trade, as it leaves to the masses of the population a larger margin than usual for expenditure on what are luxuries to them. And this will apply not alone to the United Kingdom, but to the whole Continent also. At the same time the commercial negotiations begun with all the wine-growing countries promise to give new force to the stimulus. If, in return for a reduction of the wine duties, the tariff is lowered in France, Spain, Portugal, Italy, Germany, and Austria-Hungary, we may reasonably look for an increase of our trade with these several States. But a good harvest is an indispensable condition. Another bad harvest would be a very serious matter for the farmers, and in Ireland would have grave consequences.

MIDSUMMER RACING.

ASCOT races were scarcely over before betting men were briskly engaged upon their speculations for the Northumberland Plate. We never had much affection for this race. It is generally a terribly gambling affair. The bookmakers get certain horses made strong favourites, and after they have been backed at short prices for large sums of money, evil rumours about them are spread abroad, and then they are sent down in the betting to make room for other favourites, which are treated in the same manner in their turn. Handicaps are not the most attractive kind of races, and the Northumberland Plate is not only a handicap, but one of the most objectionable types of handicap. The first favourite at starting, on the late occasion, was exactly the sort of horse one would expect to be most fancied for a race of this class. His name was Victor Emmanuel, and he had only been out once before this season, when he ran nowhere, but his reputation rested upon his reported performances in private. Thirteen horses started, and of these the greater number were beaten half a mile from home. As they were turning into the straight, the once favourite American horse Parole appeared to be running very well, but he gave way to the favourite, Mycenæ, and Inval when they were running in. It was soon evident that the favourite also was beaten. Mycenæ was now leading. This horse had been at one time a strong first favourite, but after fluctuating at all sorts of prices, he had started at 8 to 1. Inval was racing alongside of him. It will be remembered that Inval had made a tremendous race with Thurio and Insulaire a couple of years ago in the Grand Prix, when there was only a head between each of the three. The race for the Northumberland Plate was also destined to be a severe struggle, and at last Mycenæ just beat Inval by a head. Inval is an unlucky horse; for although in the course of his life he has won some half-dozen races, including the Prix Royal Oak at Paris, a race worth little short of two thousand pounds, he has an unhappy knack of running second and third, and of getting beaten by short heads.

There was fair racing at Stockbridge; but it is scarcely worth a long notice here. There was some two-year-old running, however, which ought not to be overlooked. It will be remembered that at Ascot Sir Charles seemed the best public performer of the two-year-olds that had been out this year. In his first race at that meeting he had beaten a colt called Scobell by three-quarters of a length. At Stockbridge Scobell won two races in a canter, which tended to prove the excellence of Sir Charles. The Stockbridge Cup, a weight-for-age race, was won by a two-year-old called Elfe, which beat several very fast horses, including Phœnix, Dunmow, and Hackthorpe. Elfe was himself beaten on the following day by Capuchin, who had won two races at Ascot. Robert the Devil, the winner of the Grand Prix and the second favourite for the St. Leger, walked over for the Stockbridge Biennial. At Winchester Sir Charles won another race, coming away from his opponents when challenged, and winning in a canter. In the Queen's Plate, for a wonder, Inval managed to win, instead of to lose by a head.

The Newmarket July meeting opened with the Trial Plate, for which Favo, who had won six out of nine races this year, was the first favourite. It ended in a very fine race, as Fordham brought up Attalus, who had been running badly this season, with a rush in the last few strides, and Favo was beaten by a head. Attalus had 10 lbs. the best of the weights. Eleven two-year-olds came out for the July Stakes. A filly named Bal Gal, belonging to Lord Falmouth, was so much fancied that slight odds were laid on her, although she had never run in public before. There was a beautiful race. Iroquois seemed to be winning, but Bal Gal persevered with great gameness, and won by a head. If Iroquois's form in the New Stakes at Ascot was correct, this performance on the part of Bal Gal was not worth much, for Iroquois had been unplaced to Sir Charles, Tristan, and Angelina. But some allowance had to be made for the fact that Bal Gal had never run in a public race until she appeared in the July Stakes. She is a beautiful filly, by Adventurer out of Cantinière. Her engagements are very heavy, and they include the Middle Park Plate, the Two Thousand, the Derby, the Oaks, and the St. Leger; so, if she is really good, she will have plenty of opportunities of displaying her merits. Later in the week the running in the Chesterfield Stakes was greatly to her glorification, for Iroquois won in a canter by three lengths, Tristan being unplaced. Now Tristan had only been beaten three-quarters of a length by Sir Charles at Ascot. If, therefore, the Chesterfield Stakes was a true-run race, Bal Gal might be one of the best two-year-olds of the season; if, on the other hand, Iroquois's running in the New Stakes was correct, the Chesterfield Stakes must have been all wrong.

One of the most interesting races of the week was the Midsummer Stakes. It was thought at one time that Robert the Devil would walk over; but when the day came three horses ran against him. Although he was penalized, nearly 3 to 1 was laid on him. Among his opponents was Cipolata, who had beaten the winner of the Two Thousand and Discord in a Biennial at Ascot, when 20 to 1 was laid against her. She had now 7 lbs. the best of the weights; and, after making the running, she held her advantage to the end, and beat Robert the Devil by half a length. She had run very badly in the One Thousand, but it was said that she had been ailing in the winter, so upon the whole her two victories rather tended to show that she was very good than to depreciate the merits of Robert the Devil. Before the race for the Midsummer Stakes Cipolata was a 50 to 1 outsider for the St. Leger, but after it she became a good fourth favourite. Last year's Two Thousand winner, Charibert, won the July Cup. Although it is said that he is a roarer, he has turned out to be a wonderfully fast horse over six furlongs. Great complaints were made at Newmarket about the rough scoundrels who have of late taken to patronize the meetings on the Heath. Formerly Newmarket races were remarkable for their quietness and their immunity from the crowds of blackguards which made other meetings horrible. Now, however, Newmarket Heath is becoming a favourite resort of the lowest ruffians; and one night during the late meeting a gang of roughs set upon the police, and triumphantly rescued from the hands of justice one of their number whom the constables had arrested. It is much to be hoped that the authorities will in future strengthen the force of police during the race weeks.

Last autumn we noticed the sale of the entire stock of the Cobham stud, and we then observed that a number of foals had been sold for extravagant prices. A good many of these foals were purchased by the newly-formed Cobham Stud Company, and they were re-sold at the late annual sale of the Cobham yearlings. They did not turn out a very profitable investment to the new Company, for, after being kept for nine months, they were sold for 2,700 guineas less than they had cost. One foal that had been bought for 610 guineas was sold as a yearling for 110 guineas, and another that had cost 250 last autumn now brought in only 50 guineas. The average price realized for the whole of the Cobham stud yearlings was about 176 guineas each, which was a poor price when all their expenses are considered. The heavy losses sustained by backers at Ascot may account in a great measure for the low prices obtained at the Cobham sale; but, even allowing for this, a useful lesson should be learned on the excessive folly of giving exorbitant prices for foals. At the sale of the Cobham stud last year forty-eight foals averaged 270 guineas a-piece; one of them, which was purchased by the Duke of Westminster, realizing 1,100 guineas. At the sale at Cobham this summer yearlings did not average two-thirds of the prices obtained for the foals last autumn, and the highest figure made by one lot was 700 guineas, which happened to be exactly the sum that had been paid for that very colt nine months previously. At the annual yearling sale at Cobham last year the highest price fetched by one lot was 1,300 guineas, and the year before that as much as 2,400 guineas had been received for one yearling. At the Newmarket July sales the highest price obtained last year was just exceeded, a colt by Sterling out of Siluria fetching 1,500 guineas. Last year a filly by the same horse, an own sister to Isonomy, realized 1,400 guineas, while a colt out of Siluria went for 1,000. An own brother to Isonomy was offered for sale last week; but when Mr. Tattersall stated that his reserve price was 2,000 guineas, no bid was made. A filly by Hermit was sold for 1,400 guineas, and a colt by Sterling out of Thalia for 980 guineas. The Middle Park yearlings were sold at Newmarket this year instead of at their own stud farm. The larger proportion of them were by Scottish Chief. The prices obtained were low for a stud of such repute, the highest being 550, and, out of fourteen yearlings, half a dozen did not fetch 100 a-piece. The yearling sales, so far this season, have been anything but encouraging to breeders.

The most exciting event of the racing season has been the supposed discovery that the winner of the Derby was accidentally run under a wrong name, and was therefore disqualified for that race. So much has been said and written on the subject within the last fortnight that it is needless for us to enter into all the details of the matter. The main point of the question was whether two yearlings, one called Bend Or and the other Tadcaster, had been mistaken for each other when taken from a paddock, where they had been running together, to their trainers. Both colts had been entered for the Derby. For the time being this case created as much sensation as the Tichborne trial of odious memory. One important lesson is to be learned from the affair—namely, the great necessity of keeping an accurate register of every foal born at a stud farm. White markings especially should be noted with the greatest precision. It is sometimes difficult to decide whether a foal is a bay, a brown, or a very dark chestnut; but about white marks there should be no mistake, and where the general colour is at all doubtful, the fact should be carefully stated. Another moral of the story is that dishonest people must have opportunities for fraud which it is not pleasant to contemplate. If a man had a dozen bay yearlings, and only one of them, perhaps the worst, was entered for the Derby, it seems that nothing could prevent him from deliberately picking out the most promising of the lot and sending it to a trainer's under the name of the colt entered for the Derby.

REVIEWS.

EPHESUS AND ITS COINAGE.*

AMONG the many instances of the stimulating influence of border States, few are more remarkable than the Greek cities of Asia Minor. As the meeting-ground of East and West they combined the qualities of both, and from the mixture of these op-

* *The Coinage of Ephesus.* By Barclay V. Head, Assistant-Keeper of Coins in the British Museum, Corresponding Member of the Imperial German Archæological Institute. Rollin et Feuardent. 1880.

posing elements was derived much of their prosperity and renown. Among the cities which thus served to link Hellas with the nations from which so much of her greatness was borrowed, Ephesus held from early times a prominent position. Situated in the narrow maritime plain where the Cayster breaks from its mountain course and falls into the Ionian Sea, the city which boasted one of the Seven Wonders of the ancient world was well placed as an entrepôt between Greece and Asia. Inferior in political significance to Miletus, and long overshadowed by the commercial fame of Rhodes, Ephesus was nevertheless one of the principal channels of trade with Asia, and after the fall of Miletus it became the first port on the West Coast, "the one great mart of Asia through which the fabrics and products of the East found their way to Europe"; till at last in Roman times it was allowed without dispute to be the queen of the eastern province of the Empire. As the port of Sardes, the capital of the neighbouring Oriental kingdom, it carried on a valuable trade with the interior, and its vicinity to Rhodes, if it dimmed to some extent the commercial fame of the city on the mainland, yet stimulated it to vie with the merchant island as one of the foremost trading cities of Greece. Its secure harbour, "only to be approached from the sea by a long narrow channel full of shoals at the entrance," the convenience of its central position for the defence of the Ionian coast, its large inland trade, and its store of wealth, all tended to make Ephesus a leading city even in a region teeming with active life like the eastern borderland of the Ægean. It is no marvel that "the commerce of Ephesus, great even in the time of the Lydian Kings, when the gold of the Pactolus was already flowing into the plain of the Cayster, grew with each century, in spite of all the wars and revolutions which harassed the west coast of Asia Minor and destroyed many of its most flourishing cities," and that "in the time of Augustus, when the former greatness of Miletus had become a byword; when Lebedus, as Horace tells us, was more deserted than Gabii and Fidenæ, and the other cities which once formed the league of the Panionium had mostly dwindled into obscurity, Ephesus not only maintained its ancient commercial supremacy, but was exalted above all the other cities of Asia Minor by the privileges and titles bestowed upon it by Imperial favour," and permitted to style itself "First City of Asia."

The results of its position as neutral ground wedged in between Europe and Asia are conspicuous in the history of Ephesus, which is the record of one long unbroken struggle between Oriental and Hellenic influences. At first the Ephesians were almost wholly Asiatic. The remnant of Greeks which tarried behind when the Ionian wave rolled on to Hellas scarcely modified the Asiatic character of the people, whose ethnological staple consisted mainly in Carians and Leleges, with such mixture as might come from the Phœnician station at the mouth of the Cayster. The leanings of this ancient Asiatic population of Ephesus were naturally to the great Hittite kingdom which before 1200 B.C. ruled the wide territory from the Euphrates to the cities of the coast, and had its capital at Sardes. When the Ionian reflux brought back many of the Greeks to Asia, the beginning of the Hellenic element as a political influence in Ephesus is to be traced. Androclus, son of Codrus, landing with a body of Ionian Greeks, established his colony, not in the plain where the Ephesians were dwelling, but southwards, on Mounts Prion and Coressus. He chose the spot with a true Greek's eye for beauty. Mr. Wood describes the view from Mount Prion as marvellously beautiful:—

> The river Cayster, winding like a white ribbon through the plain, forms in its course numerous small peninsulæ. The Selinusian lakes, the village and castle on the hill at Ayasalouk, the bay of Scala Nova, the mountainous island of Samos, and the still more mountainous coast beyond, the snow-capped Tmolus to the north, and the ruined city mapped out at the feet of the spectator; these, with countless other objects of interest, make up a panorama of exquisite beauty.

Here the Ionian colonists fortified themselves, and though they soon entered into friendly relations with the people of the plain, accepted their religion, and gradually became merged in their polity, the distinctive Hellenic element was never obliterated, and the efforts of the Ionian colony to link the city of their adoption more closely with mother Hellas, and the counteracting tendency of the inhabitants of the plain to unite with the Oriental Empires in their rear, were among the chief causes of the numerous tergiversations which deface the Ephesian annals. Mr. Newton, in the careful sketch of Ephesian history in his recent *Essays on Art and Archæology*, says:—

> Looking back through the history of the Ephesians from Augustus to Crœsus, we find abundant evidence of their commercial prosperity and of their adroitness in conciliating powerful neighbours, and choosing allies on the winning side; but no heroic self sacrifice, no daring spirit of maritime adventure, such as distinguished their ancient rivals, the Milesians and the Phocæans. Their policy throughout is marked by selfishness and cunning; "the lions from Hellas have become foxes at Ephesus" was a familiar Greek proverb.

At first the Ephesians naturally allied themselves closely with the Oriental monarchies—after the Hittites, with the Lydian Mermnadæ; then, on the fall of Crœsus, with his Persian conqueror. But when Persia met with the defeat of Mycale, the Ephesians turned over to the winning side, and joined the Athenian confederacy, though probably this change, the result of the Greek element in the politics of the city, was not rendered specially agreeable to the many among its inhabitants who sympathized with Persia by the annual tribute of 1,440*l.* to 1,800*l.* which Athens exacted in payment for a protection with which the Asiatic Ephesians could well have dispensed. The non-Hellenic element, however, soon reasserted itself: Ephesus seized the first opportunity to break away from the Athenian alliance, and opened its gates willingly to the Spartan Lysander, whose rule, though certainly not due to the Ionian influence in the city, led to a revival of the Hellenic spirit in the efforts he made to recall the people from the Oriental luxuriousness in which they were sunk. After Conon's victory off Cnidus, and the consequent expulsion of the Lacedæmonians from many of the cities of Asia Minor, the tie with Greece was knitted more closely; for it was at this time that a federal alliance, of which M. Waddington has discovered numismatic evidence, was concluded between Rhodes, Cnidus, Samos, and Ephesus. The Spartans, however, shortly afterwards retook the city of Diana, and after disgusting it, in company with other cities of Asia, by the severity of a yoke that was the more unbearable after a period of comparative independence, handed over all their Asiatic possessions to Persia by the disgraceful Peace of Antalcidas (387 B.C.). Ephesus probably suffered little by the transfer. Its sympathies had been with Persia all along, and it was now allowed to enjoy nearly a century of comparative independence, only disturbed by internal contests between the oligarchic party, who looked to Sparta for help, and the democratic, who preferred the alliance of Macedon. Alexander the Great, when he visited Ephesus, did not interrupt this period of autonomy; he only confirmed the democratic party in power, made a great sacrifice to the goddess of the city, accompanied by a march-past of his troops, and had his picture painted by Apelles for the temple of Artemis. But after his death Ephesus was an object worthy the greed of his successors, and was tossed like a shuttlecock from one to another, vibrating between Antigonus, Demetrius, and Lysimachus, Seleucids and Ptolemies, Attalids and Romans, Mithradates and Sulla, till it was established as the capital of Roman Asia and the residence of the proconsul, and "tasted the full blessings of the much-lauded Roman rule," which meant systematized plunder in the cities and man-hunting and slave-driving in the country districts. In Mommsen's words, "every stalk of corn grew for the Roman *decumanus*, and every child of free parents seemed born for the Roman slave-drivers. The most glorious cities were sacrificed, not to the barbarous lust of power, but to the far more horrible barbarism of speculation."

The conflict between Asiatic and Hellenic elements is even more conspicuous in the religion of Ephesus. "Diana of the Ephesians" was a strange combination of Oriental and Greek ideas. When Androclus and his Ionians landed, they found the cult of a Phœnician or Hittite, certainly Asiatic, goddess already firmly established in the plain of the Cayster. She seems to have been an embodiment of the notion of productive nature, and at first sight suggests no analogy with the Greek huntress. This Artemis—or Upis, as she was originally called—of the Ephesians is well known to us from Roman replicas (which must have been copied from the statue in the Ephesian temple), as well as from the coins, and she resembles a mummy more than anything else. The body is a mere trunk, with the feet tied together; and the most striking characteristics of her person are the numerous pendulous breasts, by which the fertile goddess of nature is indicated. She is represented as surrounded by various symbols—bees, flowers, fruit, heads of bulls and lions, the crescent moon, and stags, in some of which telluric attributes may perhaps be seen, in others possibly indications of a lunar myth. Her service was superintended by emasculated priests, of whom the chief was called *Essên* (or "King Bee"), or Megabyzus; and by virgins, called *Melissæ* (or "bees"), from whose opposition to the Ionian colonists the Greeks derived their famous legend of the fight with the Amazons. The descendants of Androclus's colony saw in this Asiatic nature-goddess some resemblance to their Artemis, and adopted her just in the same way as the Artemis Leucophryné of Magnesia and the Hera of Samos, both Asiatic divinities, were admitted to the Hellenic Pantheon. But the character of the Ephesian Artemis was always really Oriental, and her power was chiefly felt in relation to Oriental nations. She was the saviour of the city on more than one occasion. When Crœsus besieged Ephesus, a rope was stretched between the temple and the wall of the city, in sign of solemn dedication, and the conqueror dared not inflict the penalties he meditated. When Xerxes plundered and ravaged Ionia and its temples, the fane of Artemis alone was unmolested; and hither the great King sent his children for safety after his defeat at Salamis. When the Athenians invaded Ephesus, towards the end of the Peloponnesian war, Tissaphernes offered a mighty sacrifice to Artemis, and raised the people in a sort of *jehad*, or holy war, for her defence. It was the protecting influence of this Asiatic goddess that preserved Ephesus unmoved through the revolutions which destroyed many a braver city; and it was fitting that the cry of the great "Diana of the Ephesians" should be raised against the innovating apostle of the Gentiles.

The value of Greek coins as illustrating the history and mythology of the cities of Hellas is too well established to require proof; but, if further evidence were needed, it would be hard to find a more striking testimony than that afforded by the coinage of Ephesus. Mr. Barclay V. Head, the Assistant-Keeper of Coins in the British Museum, has applied to the subject the same archæological instinct and experience, and the same scientific method, which characterized his essay on the coins of Syracuse. The *History of the Coinage of Syracuse* was practically the first of a series of monographs on the currencies of the Greek cities which is designed to present the student with a complete view of the Hellenic numismatics—to form a New Eckhel, with all the additional knowledge and experience that has grown up since Eckhel's

time. Mr. Gardner's *Coinage of Elis*, which we lately noticed, is the second part of this valuable undertaking; and the third is the present *Coinage of Ephesus*, which, if deficient in the artistic interest of the earlier parts, is inferior to neither of them in historical importance or in excellence of workmanship. It is impossible to study Mr. Head's arrangement of the long series of coins from B.C. 700 to the Christian era without being convinced of the accuracy of its details, and struck with the patient observation and comparison and the true numismatic instinct which are revealed in every page. In the treatment of the metrological difficulties, no less than in the elucidation of the mystery of the magistrates' names, Mr. Head has been peculiarly successful.

The mythological interest of the coins is very considerable. The Ephesian Artemis appears throughout, either in person or represented by a symbol. There is scarcely a coin from first to last (except the cistophori) whereon the bee, the special symbol of the Ephesian goddess, does not appear; and we find the stag, or two stags (like those of silver which encompassed the gold Artemis dedicated by Salutaris), and the bow, bowcase, and quiver, on many of the coins, as well as the bust of the goddess, and finally her full figure. It is interesting to trace the gradual development of these symbols and representations. At first the bee alone appears, with monotonous regularity, though Mr. Head's quick eye contrives to extract hints for arrangement out of the shape of its wings; then, as Greek influence waxed stronger, the stag, probably a concession to the Greek idea of the goddess, is placed on the reverse; and under Lysimachus the actual bust of the huntress-goddess herself, "chaste and fair," and no Asiatic at all, occupies the principal side, yet with a little bee (*pace* Mr. Newton) on the reverse. The return to autonomy and Asiatic proclivities restored the bee to its old position on the obverse; and, under the protection of Mithradates, the Ephesian mint even issued pieces with the full, mummy-like figure of the Asiatic goddess on one side, retaining, however, the Greek bust on the other. These variations of mythological type are peculiarly interesting when considered in relation to the changeful history of the city; and the only fault we have to find with Mr. Head is that he does not make quite enough out of them, and does not sufficiently explain their meaning.

Historically the coins of Ephesus are of unusual interest. From them alone do we learn the existence of the monetary league which followed the Lacedæmonian defeat off Cnidus, and which is signalized by the issue of a uniform type of reverse—Hercules strangling two serpents—by all the cities of the league. The conquest of Ephesus by Lysimachus is marked by the appearance for the first time of the face of the Greek Artemis, and the bow and quiver, on the coinage; and when Lysimachus presented the city to his wife Arsinoe, and called it by her name, the facts are substantiated by the head of Arsinoe, veiled as a queen, and the letters ΑΡΣΙ. Later on we find evidence that the Attalid attempt to establish a pan-asiatic currency was supported at Ephesus by the appearance of Ephesian cistophori, with the cista mystica on one side, and on the other, two serpents coiled about a bow-chest. But the most important historical evidence supplied by the coins consists in the names of magistrates which are generally found inscribed on them after the fifth century B.C. There has been considerable doubt as to who these magistrates were, and how long each held his office. Curtius regarded them as archons, but on grounds which have since been demolished; Lenormant took them to be high-priests of Artemis; Mr. Head holds them to have been the prytaneis, officers corresponding in some respects to the archon eponymus of Athens; and places their tenure of office at one year. The argument by which he supports these points seems irrefragable. In 274 years 238 magistrates' names occur on the coins of Ephesus; the office, therefore, cannot well have been held for longer than one year. If it was half-yearly we should require 548 names; but, as Mr. Head shows from a comparison with the dated coins of Aradus, it is extremely improbable that our series is so incomplete as this would make it, and much more likely that there are not many years that are unrepresented in the collections of Europe. In many of the periods into which the coinage and history of Ephesus fall the number of names nearly equals the number of years, but in no case are there more names than years. After a consideration of these data, it is difficult to see any alternative to the conclusion that these magistrates held an annual office. That the magistrate whose name thus appears on the coinage was the *eponymus* of the city, the first Prytanis, or President of the Council of Prytaneis, who superintended the execution of the decrees of Boulé and Demos, ordered the public sacrifices, looked to the taxes, inspected the markets and harbours and highways, and gave his name to the year, is demonstrated by a series of historical confirmations which signally attest the present high development of the science of numismatics. An Ephesian inscription published by Mr. Wood, and attributed to the years 324 to 319 B.C., gives the names of four prytaneis who were the eponymi of four successive years. Turning to Mr. Head's corresponding period, arranged, let it be understood, simply on general principles of style and palæography and the like, with no dates to guide him, we find three of these four names actually occurring on the coins. The fourth will doubtless be found in time. Another inscription mentions a certain Badronius—a name which appears on a coin of the corresponding period in Mr. Head's arrangement, and is nowhere else to be found in Greek literature or antiquities. Josephus speaks of an Ephesian decree of B.C. 43, beginning with the words Ἐπὶ πρυτανέως Μηνοφίλου, and, among the coins classed by Mr. Head as after B.C. 48, the name of Menophilus is discovered. These three historical notices place beyond dispute Mr. Head's view that the magistrate of the coins was the eponymous Prytanis; but the modest way in which he states his argument and enumerates his discoveries conveys but a slight impression of their singular value to any but the initiated. That a long series of coins should be arranged chronologically on minute grounds of style, which it needs a numismatist even to understand, yet so accurately that when an inscription appears it only confirms the arrangement, is the strongest possible testimony to the archæological instinct of the arranger. But no one can study this interesting volume, with its fine photographic (autotype) plates, without being astonished at the certainty to which the science of numismatics in the hands of such scholars as Mr. Head has attained, and the amount of artistic, mythological, historical, and even economical knowledge that is to be derived from the patient study of the monetary series of a Greek city.

LES DEUX MASQUES.*

M. PAUL DE ST.-VICTOR, the author of a vast work on the drama of which the first instalment lies before us, is not so well known to the English public as he deserves to be. For many years M. de St.-Victor, a man of wide literary knowledge and the most picturesque of writers, has contributed critical *feuilletons* to various Parisian newspapers. Like Gautier, he has written on almost all literary and artistic subjects; like Gautier's, his style is rich and sparkling, though it has a sort of stiffness as of brocade, which differs from the pliancy and flexibility of the elder and more famous journalist. M. de St.-Victor has never, as far as we know, displayed the high animal and intellectual spirits of Gautier's earlier criticisms and essays, as shown, for example, in *Les Grotesques* and *Les Jeune-France*. In a volume named *Hommes et Dieux*, published many years ago, M. de St.-Victor collected a number of his scattered papers. He wrote about Greek art and religion, about Helen and Artemis, about Henri III. and Nero, about Charles II. of Spain, about the mediæval Jews, about the poets of the Greek Anthology, and a score of other subjects; and all his essays had some rather remote or even fantastic interest. They were almost overladen with far-fetched verbal ornament, though the search for images and illustrations obviously gave the author no trouble. His mind is an opulent store of simile and anecdote, and he scattered his wealth "as rich men give, that care not for their gifts." The consequence has been that English essayists steal freely from M. de St.-Victor, and abstain from calling public attention to his *Hommes et Dieux*. His other little volume, *Barbares et Bandits*, was written while the Prussians and the Commune besieged or lorded over Paris. It is touched with the shame, the terror, and the anger of those times, and the admirers of M. de St.-Victor will lose little if they neglect *Barbares et Bandits*. For many years the covers of M. de St.-Victor's books have borne the advertisement of a forthcoming work, *Les Masques et les Bustes*. Perhaps that volume is among those which only exist in prophetic advertisements. The new book, or rather the first instalment of the new book, on the theatre, *Les Deux Masques*, derives its title from the tragic and comic aspects of the Greek Muse. This volume deals with Æschylus, and, as it contains no less than five hundred and fifty pages, it is plain that M. de St.-Victor has plenty of ground to cover before he reaches Molière or even Shakspeare.

The author explains his own method in a short preface:—

> Much has been written on the theatre of the Greeks. I have tried to deal with a subject so often handled, if not in a better way than my predecessors, at least in a different manner. Mythology and history hold as important a place in my work as literary criticism. To restore the Greek tragedies and comedies to their original environment, to illustrate and enlarge the study of these pieces by a wider study of the ancient world, with the hints and historical parallels which such a study suggests; to lift the mask of every god and of every person who appears on the scene, with the purpose of describing his religious aspect or legendary character; to comment on the four great Athenian poets, not so much in the letter, as in the light of the spirit, of their works, and of the genius of their time—such is the plan that I have traced for myself, and have endeavoured to execute.

Our purpose at present is to examine M. de St.-Victor's general system—a system which is to be employed on so large a scale—to criticize his mythological ideas, and to remark on what we venture to think singular aberrations of literary taste. The system is the scientific one of restoring, as M. de St.-Victor says, the plays to their religious and historical environment. First the author sketches the growth and development of the worship of Dionysus, in whose service the old choral dances and songs had their place. Then he speaks, more briefly, of Thespis and Phrynicus. Next he writes at length on the history of Æschylus and of his period. The fifth, sixth, and seventh chapters recount the story of the Persian war, with all the wild legends of oracles, portents, and apparitions of Gods which give the Muses of Herodotus their epic character. The reader is now in a position to understand the temper in which Æschylus wrote, and in which Athens watched the *Persæ*, a play which M. de St.-Victor criticizes with great abundance of historical illustration. He repeats the tales of Persian loyalty, and of the cruelty and the power of the Sultanas, so that the reader may understand the Chorus of Persian peers and comprehend the position of Atossa, the mother of Xerxes. Beyond

this we do not intend now to follow M. de St. Victor; his account of the *Orestia* may be reserved for some later occasion.

To begin at the beginning—M. de St.-Victor indulges freely and at great length in mythological speculations about Dionysus, the god of the vine and the patron of the drama. We cannot but think it unfortunate that he has fallen into the Vedic trap which is set for all literary students of Greek mythology. We must say again, as we have so often said before, that the interpretation of the Vedas, with all the inferences which may be drawn from those hymns, is in a most chaotic condition. While Mr. Max Müller and Mr. Sayce, with their pupils, seem to regard the Vedas as "primitive" works which contain information about the origins of Aryan religion, other students point out that the Vedas, far from being "primitive," are the hymns of a civilized people, and that about the origins of religion they can tell us no more than the Christmas articles in the *Times*. Again, while Mr. Max Müller disputes the presence of fetichism in the earlier Vedas, and hence inclines to suppose that fetichism is not "primitive," but a corruption of primitive religion, other authorities see in the Vedas the ritual of a fetichism that has been highly organized. We have not to decide between these contradictory views, and other views which also are entertained. But it is plain enough that the literary student who takes up any theory of Vedic religion and applies it to his purely literary studies is extremely likely to lose his way and to encumber his books with material that may soon be exploded. Yet critics go back to the Vedas, just as older writers always started from the Garden of Eden, Hebrew the primitive language, and the rest of it. M. de St.-Victor begins by declaring that "the Vedas, now an open book, have revealed the direct relation of the religions of Greece with the first beliefs of the Aryan race." Well—for we must take a side after all—we do not believe that the Vedas tell us anything whatever about "the first beliefs of the Aryan race." One might as well say that the hymns of Pentaur tell us about the first beliefs of the Egyptian race. Did not the ancestors of the Hellenes leave the general Aryan stock long before the Vedas were composed in Sanskrit? This is a point about which information seems desirable. Philology, says Mr. Max Müller, gives us "what we may call contemporary evidence, exhibiting to us the state of thought, language, religion, and civilization at a period when Sanskrit was not yet Sanskrit, Greek not yet Greek, but when both, together with Latin, German, and other Aryan dialects, existed as yet as one undivided language" (*Chips*, vol. ii. p. 17). The Vedas are composed in Sanskrit, and we are anxious to know whether the ancestors of the Greeks had left their "Aryan home" before Sanskrit was a language? If they had, there must be a gap of many centuries between the Aryan dispersal and the composition of hymns in a language which did not exist when the ancestors of the Greeks and of the Brahmans dwelt together. In that case, what can the Gods of Greece have to do with the Vedas? The common elements of Greek and Indian religion must, if this be so, have existed hundreds of years before there were Vedic hymns, or even a Sanskrit language. What light, then, do the hymns to the Soma juice throw on the worship of Dionysus? And these common elements must be much more "primitive" than the Vedas. M. de St.-Victor has not reasoned thus; he has reasoned that the Aryans when they entered Greece bore with them the worship of Soma, and he calls a Vedic hymn "cette apparition primordiale de Bacchus." Yet, when he comes to critize the religion of Æschylus, he admits that the early deities of Greece were not pure, bodiless, atmospheric phenomena. Ares was "an old rusty sword," Demeter had a horse's head, Aphrodite was a squared stone, Artemis ("Αρκτεμις?) was a she-bear, and so on. What M. de St.-Victor says here (pp. 96, 97) is quite true, but his explanation is less satisfactory. He appears to think that the Aryan ancestors of the Hellenes worshipped "les phénomènes physiques," but that the Pelasgians degraded the pure physical phenomena into the forms of animals and fetich-stones. But it is surely quite as scientific to hold that the far-off ancestors of the Hellenes, like other savages, worshipped a whole menagerie of beasts, the beasts whose images were preserved in the temples of later gods, as their cult was swallowed up in that of Artemis and Apollo. If these beasts, as among other races, were regarded as progenitors of various tribes, we can understand how Zeus or Apollo was fabled to have become, under an animal shape, the wooer of Leda or Europa, the father of the children of the Swan, and of the Bear-tribe of Arcadia. But the system of M. de St.-Victor starts from an "Aryan" cult of which we can know nothing, imagines an age of Pelasgian degradation, and then a period of purer intelligence which must have its place in any theory. It is obvious that a study of the evolution of the drama is only clogged by all this possibly mistaken mythological science.

As we are about fault-finding, we may as well end by remarking on certain places where M. de St.-Victor, like Æschylus, exhibits in his style "le débordement des images." Here is a fair example of a happy simile. Bacchus, the latest evolved of the gods of Greece, "est le dernier venu dans la grande famille de l'Olympe. Il y arrive en retard comme un prince aviné qui se fait attendre au banquet royal où il est convié." Again, about Adonis (whose worship is described with wonderful force), M. de St.-Victor says:—"Adonis entra de bonne heure dans l'Hellade; le génie du lieu orna et embellit sa légende. Ce fut comme si Praxitèle avait retouché de son ciseau et ramené au type grec une bizarre idole orientale." Here is his description of the first actor who interrupted the Chorus:—"Un jour, aux Lénéennes, un homme inconnu . . . élu mystérieux de Melpomène, pris aux cheveux par elle, comme Achille le fut par Pallas, Habacuc par l'Ange, s'élance sur la table du sacrifice, converse avec le Chœur, lui parle, lui répond." What in the world have "Habacuc" and Achilles to do in this *galère*? We say it with regret, but this *genre* of eloquence seems inflated and Asiatic. Once more, when the eagle took the bald head of Æschylus for a stone and let the tortoise fall on it, M. de St.-Victor says that the bird made no mistake—"C'est dans l'âge de pierre qu'il faudrait ranger le génie d'Eschyle." Now such criticism as this is quite wild; there is no resemblance of any sort between the work of Æschylus and palæolithic art. Even if there were, the eagle had no sound excuse for its unlucky blunder. But this is a trifle compared with M. de St.-Victor's statement that "Eschyle avait un théâtre tué sous lui." Mr. Myer's recent essay on Æschylus in *Hellenica*, and on the serenity of his genius behind the storms of the stage, is a corrective of this "débordement des images." But we have dwelt sufficiently on the faults of the brilliant *feuilletoniste*, which have escaped from the *causerie* into the book. We hope to return to M. de St.-Victor's literary criticism of the characters, the conduct, and the situations of the dramas of Æschylus.

A CAVALIER'S NOTE-BOOK.*

If, by way of analogy to the origin which has been actually assumed for part of the history of ancient Rome, that of England in the age of the Puritan Revolution and the Restoration had to be put together out of family records, a serious conflict of statements as well as of opinions would occasion some difficulty in selecting the materials of the narrative. And perhaps the greatest amount of suspicion would attach to those which had the best excuse for one-sidedness, as in the case of notes or writings of the Roman Catholic gentry, to whom each turn in public events must have seemed to signify nothing but a change of sufferings. On the sacrifices of the Civil War followed the sequestrations under the Commonwealth; after which the reign of a crypto-catholic King gave birth to the deadly panic of the Popish plot; nor could the delusiveness of the hopes excited by the plain dealing of his maladroit successor fail speedily to become patent even to those who might serve him without scruple and ask favours of him without shame. But the value of such historical records as those now before us is unimpaired by a partisanship of which they make no secret whatever. In no part of England, as is well known, was there a sturdier growth of Recusancy to be found than in Lancashire, then, as in later days, strangely, though by no means inexplicably, divided in its political and religious opinions. And among the old Roman Catholic families of that county, which partly survive to this day—objects of interest and pride to many in the county besides their fellow-religionists—none has more manfully adhered to its religious faith than the Blundells. On both these heads abundant evidence is furnished by the literary remains of the high-minded "Cavalier" who, during the long and troubled period between the years 1638 and 1698, was the head of the House of the Blundells of Little Crosby, and whose descendant (in the female line) appears to this day to be able to say of his village what his ancestor said to King James II. of his township, "that there is neither beggar, alehouse, nor Protestant within it." The Blundells of Little Crosby, which is five miles from Liverpool, are to be distinguished from their neighbours the Blundells of Ince Blundell, with whom they are only on a single occasion known to have intermarried, though community of creed and mutual goodwill have existed between the two lines for nearly seven centuries.

Among the notes in the collection now before us, edited with an interesting though rather prolix introduction by Father T. Ellison Gibson, is "a list of the names of Popish Recusants of the greatest quality in the county of Lancashire" whom, at the time of the Exclusion Bill agitation of 1680, it was proposed to banish from the kingdom together with the rest of the leading Roman Catholics in it. Among these it may safely be said that there is none more honourably typical than that of William Blundell of Crosby. We cannot help regretting that his descendant should not have in the first instance given to the world the *letters* which remain from William Blundell's hand, and have reserved the selection of *notes* from his commonplace books, which necessarily vary very much in interest, though the writer was a man of literary tastes as well as a shrewd practical observer. But, at all events, these commentaries on the bad times and things in general give flesh and blood to the sketch of their author offered by his editor, and also sufficiently illustrate and corroborate the account of the sufferings of William Blundell and his family to be found in a petition which he prepared for presentation to King James. Owing, no doubt, to the speedy alteration of the hopeful mood which had suggested it, this petition was never actually presented; but we cannot perhaps better recall in outline the experiences of the brave and loyal gentleman to whom Mr. Gibson has introduced us than by expanding with his aid some of the statements in this neither lengthy nor undignified supplication.

The King, then, is first of all reminded of the fact that no son or daughter of the line represented by the petitioner has ever been known to profess any other than the Roman Catholic religion, and

* *Crosby Records.—A Cavalier's Note-Book: being Notes, Anecdotes, and Observations of William Blundell, of Crosby, Lancashire, Esquire.* Edited, with Introductory Chapters, by T. Ellison Gibson. London: Longmans & Co. 1880.

that accordingly "since y^e pretended Reformation, it hath suffered persecution for the same in an extraordinary degree." William Blundell refers to the many imprisonments undergone by members of his family under the Recusancy statutes of Elizabeth, when (unlike the Traffords) the Blundells were among the persecuted, and not among the persecutors. Two-thirds of his ancestor's lands had at that time, in accordance with the evil alternative offered to Recusants, been in the hands of the Crown; nor had they been recovered till the brief period of respite on the accession of James I., from which event so many Catholics vainly hoped for the advent of better days. But, as we learn from Mr. Gibson's Introduction, after the discovery of the Gunpowder Plot these lands had again been seized, having been "begged" by courtiers from a king who was ever most facile where he should have shown least favour. The shifting policy of James I. afterwards allowed some relaxation in the treatment of his Roman Catholic subjects, as is incidentally shown by the circumstance that the then Mr. Blundell of Crosby could establish in his own grounds a burial-place for members of his own faith. But early in Charles I.'s reign this was pulled down, and the owner, together with some of his tenants who had resisted the sheriff's officers when levying a Recusancy fine, was imprisoned and mulcted in money by the Star Chamber —whose tender mercies were by no means confined to Puritan recalcitrance. William Blundell, however, prefers to appeal to the sufferings and services of himself and his more immediate belongings. Among his hundred kinsmen or kinswomen who had at one time or another entered the priesthood of the Church of Rome or taken religious vows in it, he could number not less than seven children of his own. It elsewhere appears that in the three generations in the midst of which William Blundell stood, seventeen Blundells, male and female, devoted themselves to a religious life. In stating this fact, which may at first sight seem surprising in times when danger if not death waited upon such devotion, Mr. Gibson takes occasion to dwell on the blindness towards its own interests exhibited by the Protestant legislature in excluding the sons of Roman Catholic gentlemen from all suitable secular employment. The Church of Rome could thus command the services of the only class of persons among its members who had the means and opportunity of becoming priests; while the Recusant gentry obtained chaplains congenial to themselves by their birth and breeding. The proscribed Order of Jesus in particular, which in William Blundell's time is stated by him to have possessed five colleges in England, and which in the year 1601 was supposed to number as many as 109 members in this country, and altogether 280 members of English birth, attracted many gentlemen into its ranks, though for obvious reasons they frequently were known under assumed names only.

Had not (continues William Blundell) so many male scions of his family been in orders, more of them would have been found under arms on the King's side—for, of course, "there were none at all that fought on y^e Rebells' side." But even so, "there has been very many" who fought for the King—as indeed it is well known that few Catholic families showed any slackness in this respect. Indeed, in a treatise on the Penal Laws, published by William Blundell himself, and cited by Mr. Gibson, it was asserted that "whereas the Catholic gentry of the Kingdom were computed before the wars at one-fifteenth of the whole, no less than one-third or one-fourth of the officers of the King's army were Catholics." And yet, as we learn from one of the Clarendon MSS., when the King set up his standard at Nottingham, he had inhibited all Recusants from resorting to his army. William Blundell's own services as a soldier were brilliant, though brief. Towards the end of the evil year 1642 he had accepted a captain's commission, "for the defence," among other things, "of the Protestant religion," under the gallant Sir Thomas Tildesley, who, after his long-sustained devotion to the Royal cause, was destined to fall in Lord Derby's unfortunate affair at Wigan in 1651. Lord Derby (then still Lord Strange) had, as readers of Clarendon will remember, allowed the wish to be father to the thought when calculating on a fuller support in Lancashire for the King's cause than it actually received there; the commissions granted by those acting in conjunction with him in this and in the neighbouring county were the less likely to be interfered with. William Blundell, though then but two-and-twenty years of age, was already an old married man. He had received his early training in all probability at "one of the secret places of education" in England, "well-known to those who adhered to the ancient faith" —about which we should have been interested to learn more from Mr. Gibson than he finds space to tell us, more especially as that in which William Blundell was brought up seems to have helped to implant in him a genuine love of learning. Then, he had married when fifteen years old, in order that, his father having died, his grandfather might make a fresh settlement of the family estates and thus avert from them the peril to which they were liable under the Recusancy Acts. But he now readily took service at the head of a company of dragoons raised by himself, doubtless from among his tenants, and bore a conspicuous share in the successful assault upon Lancaster. The wound, however, which he on this occasion received put an end to his military career, and made him a cripple for life—he was afterwards called Halt-Will by his facetious Lancashire neighbours. Although the resistance which he continued to offer to the adversaries of the Royal cause was by no means only of a passive kind, he had henceforth to assert it, and to suffer for it, in a corner. He was "4 tymes taken prisoner and p^d his ransom twice"; while his estates were sequestrated for a period of something like ten years —one-fifth being allowed to his wife, and the demesne [illegible] diately around his house being farmed by himself. Then, in the year 1653, he was allowed to compound for the repurchase of his lands with his own money, or rather with what he had scraped together for the purpose. But he preferred to spend the years 1658–1660 on the Continent, whence he had the happiness of returning on board the *Royal Charles*, lately the *Naseby*, in company with the King himself. It was here that, as William Blundell mentions in his Note Book, King Charles took occasion to measure his height against the lintel of the cabin, and to justify by anticipation the assertion of a famous epigram that he was "of a tall stature." The loyal Cavalier avers that though sundry tall persons "went under the King's mark, none could reach it"; but he rather seems to imply that it might have been reached by "an Irish stripling under 17 years of age," whom he saw on a subsequent occasion, and who, he thinks, measured "7 ft. 2½ in. in his shoes, which were not high. He was languid and listless, and not comely, although he was straight." There were, however, other giants in those days, the Hollander, for instance, whom Mr. Blundell saw for 6*d.* in the Strand.

"The persecution occasioned by the late plot"—the Popish Plot to wit—of which His Majesty would be likely enough to retain a remembrance, is pointedly referred to in the petition to King James. From a letter written by William Blundell in 1673, and cited by Mr. Gibson in his Introduction, it is clear how the hopes of the Catholics had already been turned into misgivings, the expression of which is here accompanied by reflections which are not the less bitter for the self-restraint observed in them. After speaking of a villanous book of Prynne's advocating the principle of Resistance, and of the apologies offered for the beheading of King Charles "by Milton and others," he continues in words which deserve citing in full:—

> Yet Milton and those are pardoned and live in security. Prynne, as is very well known, was an eminent Parliament man, a mortal foe to the Papists, and was cherished with a very fair salary and with singular places of trust since the King came in. I think we do not seek for preferment. For my own part, I am sure I only plead "pro domo mea," for the same house and lands which I lost for my duty to the King, to a pack of those arch villains, and purchased it from them again after nine or ten years' sequestration, with money which I borrowed. My limbs, my goods, my liberty, I lost on the same account. Many others of ours lost life and all. And ours and our greatest enemies' principles are still the same. If we must therefore beg or hang, I pray God bless the King, and the will of God be done. My dearest sir, I wish as much as you that *we were together one day before we suffer*.

The gloomy forebodings implied by this last phrase are in some measure explained by the fact that this letter was written just about the time when King Charles, after withdrawing his unlucky Declaration of Indulgence, gave his assent to the Test Act, which was its direct consequence. Before long, the old Recusancy penalties were being enacted again; and when the Popish Plot agitation broke out, Mr. Blundell's Catholic tenants, and, by implication, their landlord, were impoverished by the exaction of the monthly fine of 20*l.* Before this, the loyal Cavalier had been troubled to see his "trusty old sword" taken from him ('w^{ch} had been my companion w^n I lost my limbs, my lands, my liberty, for acting against the rebels in the King's behalf) by an officer appointed for y^e purpose, who in that former old war had been a captaine against y^e King." But amidst indignities and injuries he stood firm; and when, on his application to Government for a pass to go abroad, he was called upon previously to enter into his recognisances not to return without a licence, he refused, on any consideration, to "lead the life of an outlaw." He ultimately obtained an unconditional licence, and resided in France for some months.

The petition, as we have seen, was never presented, and, after the brief respite of King James II.'s reign, the sorely-tried Cavalier's trials began again. He was imprisoned at Manchester in the pleasant company of Mr. Towneley of Towneley, the head of the famous Roman Catholic family which died out only the other day; and after his release he spent the remainder of his life at home at Little Crosby—prohibited by the Act from moving beyond the length of his "five miles' chain." Four years before his death, which occurred in 1698, three king's messengers had arrived there to carry him off on the charge of participation in that "Lancashire plot" which the same miscreant invented and exploded. They respected the grey hairs of the worthy old man, however, and contented themselves with carrying off his son, together with some of the contents of his gun-room and stables.

We have reproduced the main events in the life of the Cavalier, and have thus left ourselves no space for describing at any length the contents of his Note-Book. It is, however, not only full of details interesting in themselves with regard to the manners and notions of an age which diaries and drama together have made so vivid to us that we can never read enough about it. Here once more we are reminded of its drinking and dicing, and, above all, of its duelling—against which William Blundell wages war like a gallant gentleman who could well afford to do so—as well as of features which are less distinctive of it as compared with other periods. Among these we do not know whether to include the commercial dishonesty of the age, on which Mr. Blundell might be thought to be unduly severe, after the manner of country gentlemen; were it not that in his opinion English traders compared unfavourably with the Dutch, for whom he could have no special liking. In spending money, on the other hand, he has evidence to show that Lancashire folk are ahead of the rest of England. As, for instance, "a man who showed a

dromedary in most parts of England told me (1662) that he found more profit thereby in Lancashire than in any other county." A considerable variety of other curious information appears in the Cavalier's notes, which are learnedly margined with Latin headings, together with some entertaining, if not always deeply instructive, observations *de Anglicè scribendi* or *loquendi modo;* and even a good story or two, which we regret not to have room to quote. But the chief value of the Note-Book is, after all, that it completes the picture of as true a gentleman as has ever unconsciously sat for his portrait to himself. Of the sturdy adherence of William Blundell to the faith of his fathers we have given sufficient proof; nor is it very surprising to find in a man of his times and training a considerable amount of superstitiousness of a general kind, and a firm belief in God's *judicia in Catholicorum hostes.* But such men as he are no mere puppets in the hands of others. Not only does he (in a letter of the year 1679) declare that "as for invasions, it hath ever been my professed principle, that all, even Catholic subjects of a lawful Protestant King (such as King Charles y^e 2^d.) are obliged faithfully to adhere to that King in all invasions w'soever, though made by Catholic princes or even by the Pope himself." Not only was his head full of plans of social reforms which in their variety almost recall the busy philanthropy of Defoe, and which bespeak an independent as well as a benevolent mind. Active in nearly every direction open to him, an energetic farmer and a successful author, he must at the same time have had that true politeness of which he seems so thoroughly to appreciate the worth, and which goes to, because it comes from, the heart. One of his favourite rules in thinking and speaking of others seems to have been *judge not*—a precept which not all that are persecuted as he was find it easy to obey. We sincerely trust that *A Cavalier's Note-Book* will find many readers equally desirous with ourselves of making acquaintance with the half-promised *Letter Book* from the same hand.

MISS BOUVERIE.*

WE felt well disposed towards this novel as soon as we had glanced at the title-page and begun to cut the leaves. In the first place, we saw that it was written by Mrs. Molesworth; and Mrs. Molesworth, we knew, always writes pleasantly. In the second place, though there are three volumes, each volume has not very many pages. In the third place, the type is large and the lines have been kept well apart. It was a book, we saw, that we could read easily and rapidly. In this respect it differed greatly from many of the stories that have lately come under our notice. A novel—at least the novel of one of the minor writers—should, we hold, never be so long but that it can be read with ease on a summer afternoon or a winter evening. We do not want to take the plot either to dinner or to bed with us. It is like a bottle of light wine—it should be finished at a sitting. Now *Miss Bouverie* is lively enough to keep the reader's attention fixed, and it is short enough to allow him to read the closing chapter before he has had time to forget the opening scenes. There is no call made at any time upon his understanding. There are no family trees which he must carefully study, and no complications to worry him by the demand they make on his memory and his sagacity. There is, indeed, an eccentric will, or rather a settlement; but something of the kind must of course be allowed to every author. Wills and settlements are almost as needful to novelists as are mulberry-leaves to silkworms. Deprived of them, they would find it a nearly hopeless task to attempt to spin a plot. With a liberal supply of villains, no doubt a story may be written without the help of any legal complications; but then in villains Mrs. Molesworth's strong point does not seem to lie. She is apparently happily aware of her own deficiencies; and, knowing very little of villainy, she is wise enough and moderate enough not to introduce it in her stories. Her worst character in the book before us is a young French lady—heartless enough, no doubt—who nearly scares the poor heroine out of her wits by coming upon her at nighttime in the disguise of a family ghost. Nevertheless, in spite of the absence of the wickedness with which so many of our writers now fill their stories, these three volumes are never dull. Life, we are forced to admit, can be fairly interesting even when murderers and forgers are wanting; nor does it seem needful, in order to keep the reader from falling asleep over his novel, to bring in a fresh criminal—or, at all events, a fresh crime—with the opening pages of each chapter. But from these somewhat general considerations, into which we have naturally fallen on laying down the last of Mrs. Molesworth's pleasant volumes, it is time to pass to some account of the story itself.

In the opening scene we are introduced to Miss Laura Bouverie, the heroine, when she was a child of eight. Her grandfather, Squire Sydney, had married twice. From his first wife was descended the hero of the story, Hugh Sydney; and from the second, who was a French lady, Laura Bouverie. Hugh's father had resented the second marriage, and had behaved to his foreign stepmother with the greatest rudeness. The old squire, in a passion, "had completely disinherited him," leaving all his property to his only daughter, Laura's mother. No one of his family knew what he had done till he was on his deathbed. Then, when there was no possibility of undoing it, he began to repent. He sent for his son-in-law, Mr. Bouverie, who had been left a widower with one daughter, and told him of the settlement that he had made. "It," he said, "was irrevocable—unalterable, at least, for many years to come." All he could do was to beg him to surrender one half of his income to his son's widow and child. But Mr. Bouverie met with an unexpected obstacle in carrying out the dying man's wishes. The disinherited descendant obstinately refused to be reconciled with his dead grandfather. He would not take back any part of the property. Would he have condescended to receive it, he might have had even the old family mansion; but he persisted, instead, on entering the army and going to India. Here he and the heroine part—he a dashing young subaltern, and she a pretty little girl of eight years old. The curtain at once falls upon the scene, and is not lifted till twelve years have gone by. She then is old enough—a year or so too old some perchance will say—to be a heroine, while the proper time has arrived for him to return home on his leave of absence. In her eyes he has always remained the hero that she held him to be when she was a little girl, while he, on his part, had never forgotten his little cousin. Unhappily he had brought with him from India all the pride that he had taken there, and his pride was at once awakened by a scheming, match-making aunt. The cousins were to meet for the first time at a dance. Laura was all eagerness for the meeting to which she had so long been looking forward, but she was at once chilled by his cold greeting. He had learnt that all the family expected that he would marry her, and so recover the estate of which his father had been deprived. He had been led to believe, moreover, that she was a party to this family scheme. The misunderstandings into which the cousins fall are cleverly described. Both were proud, and both, moreover, somewhat too suspicious. The chances of their ever being reconciled, much more of their ever being married, seemed remote indeed:—

> "I shall never like him again," she said to herself, "*never*. I know I am not vindictive or easily offended, but once a person has behaved as he did—considering all the circumstances—it shows a hard, selfish, unsympathetic nature, and such a nature one *could* not like. How can he have changed so utterly? To think that I once put my silly little arms round his neck, and cried, and would not let him go—and how tender he was! There were tears in his own eyes. He could not bear to see anything suffer. I remember when one of my doves hurt its leg. And all these years I see now that he has been a sort of unconscious hero to me—the personification of manliness and goodness, and everything nice. What can have changed him so? Even if it were to turn out just a fit of bad temper, with which I had nothing to do, I should not like him. I don't mind some kinds of bad temper, but I hate a kind that makes one hard and indifferent to others' feelings—— —"
>
> "But no," she decided, after further reflection, "it couldn't have been merely bad temper. It was a *parti pris*, for fear of my presuming on our relationship to be too friendly." Laura's cheeks glowed at the thought. "I suppose he is so accustomed to be adored. Oh! I *do* so hope he didn't see me hold out my hands—how could I have been such an idiot? No, no, I can never forget it—I can never like him—he has hurt and mortified me too much. But I *won't* think of him."

We are so accustomed to find, whenever a young lady announces her intention of never liking a young gentleman, that she is within a few days of accepting him, and a few weeks of marrying him, that we were not in the least discomposed by Miss Laura's soliloquy. But our confidence did begin to get shaken as the story went on, and no reconciliation came. Half way through the first volume she again repeats, and repeats emphatically, that she will *never*—with a dash under it—modify her opinions. Some forty pages further on, when talking to herself, as she was very much given to do for want of a confidant, she exclaimed, "Ah! if there is one person in the world I do honestly dislike, it is you, my dear cousin, Hugh Sydney!" At the close of this volume she says that she cannot imagine herself ever liking Major Sydney. We are only as yet in the first volume, and many a pair of lovers have by that time got quite as far apart. But matters do not improve. She begins the second volume by announcing that she is never going to marry, and that she intends to grow from a young woman into an old maid. Well, that is what, according to our literary experience, most young ladies say at some period or other of their life; but it is scarcely a sentiment that outlives the first volume. Laura, however, goes on from bad to worse. In page 71 of this second volume, again in a soliloquy, she exclaims passionately, "Hugh Sydney, I detest you. I hate and detest you." In page 75 she speaks of him as "that horrid Hugh who has spoilt all the pleasures of the visit." In page 157 her full assurance returns of the old maidenhood that awaits her. "To-day," she says, "has taught me that more surely than ever, I shall never marry; I am different from other girls." We reach the close of the second volume, only to find that the third begins with the same atrocious sentiments. But towards the middle of the third—not a moment too soon, the experienced reader will allow—she shows some slight signs of softening. "'I really do feel as if I *hated* him sometimes,' she said to herself. . . . 'I won't mind him—no, I *won't!*'" Still nearer the end than this, she turns towards the Major, "with an actual smile of satirical amusement on her face," which was, he felt, worse than "her hottest, most contemptuous, indignation," while a moment after "she turned away from him with the haughtiest coldness." Less than forty pages from the end "she hardened her heart against him," while he had announced his intention of starting at once for India. Things did certainly look a little brighter in the next paragraph, when the tears rose unbidden to her eyes; but with less than forty pages—pages, too, with the lines printed well apart, with so proud and obstinate a hero and heroine, and with such sad misunderstandings between them—what can we expect even the most skilful

* *Miss Bouverie.* By Mrs. Molesworth, Author of "Hathercourt Rectory," "The Cuckoo Clock," "The Tapestry Room," &c. 3 vols. London: Hurst & Blackett. 1880.

writer to do? But matters are worse even than this. The author has a second pair of lovers on her hands, who also have complications of their own so great that they would seem to us to need half-a-dozen chapters to themselves before they could get them thoroughly disentangled. She has also on her hands the spiteful young French lady and a family ghost, not to mention an elderly uncle, a baronet moreover, who is ill of the smallpox. How the story is brought to an end, whether there is still a Miss Bouverie, an old maid by this time, and whether Major Sydney again served his country in India, or whether a means has been at length found to carry through the wishes of the penitent old Squire, we must leave our readers to discover for themselves by turning to the concluding chapter of Mrs. Molesworth's pleasant story.

By no means the least interesting and clever character in the book is one on whom we have not even touched—Laura's French cousin, M. De La Croye. By the way, Mrs. Molesworth seems to us to have taken so strong a prejudice against the nation to which he belonged that, when she wants to introduce a really good Frenchman, she is forced to give him a German mother. We could wish she had carried her prejudices one step further, and, when she was giving us conversation that was spoken in French, had always turned it into undoubted English. "What have you, M. le Major?" in the sense in which it is meant, is but a poor piece of mongrel writing. We must object also to one or two of the expressions which she puts into the mouths of English people of forty years ago. At that time we doubt whether even schoolboys talked of "lots of children" and "lots of houses." Most certainly young ladies did not. A fine day was not called "perfect weather," nor did a country parson ever "feel intuitively." Neither would he have discovered in a young Frenchman "something intangible and impalpable which prevented him putting him down." We doubt even whether "palely glowing colza" as yet was known. In those days long words, no doubt, were used; but a sentence usually ended as finely as it began. A paragraph that opened with "annoying contradictoriness," and went on to "disagreeable consciousness," would not have been wound up "with a wet blanket" and "a shove in the right direction." But faults such as these are not very common in Mrs. Molesworth's pages, and we must not therefore part with her in a too critical mood. On the contrary, our last words must be our thanks for the pleasant and innocent story with which she has beguiled a few hours of our time.

HOLLAND'S ELEMENTS OF JURISPRUDENCE.*

(Second Notice.)

IN a former article on this book we expressed our doubts as to the claim of Jurisprudence to exist as an abstract science beside and apart from the study of particular legal systems; at the same time we admitted that the treatment of it as such may in the present state of English legal education and literature be provisionally justified. We have now to see how Professor Holland handles the subject which he has defined as the formal science of law. His exposition, we may say at once, is clear and careful throughout, and the work will for law students' purposes be a great improvement on Austin. Though considerably less bulky, it is more complete, more symmetrical, and more intelligible. As literature it is almost incomparably better. Austin's painfully laboured style has an effect amounting to repulsion on some persons, of whom we confess ourselves to be. Professor Holland's is concise without abruptness, flowing without tediousness, and distinct without wearisome repetitions.

The subjects discussed at the outset are naturally the definition of law and the theory of sovereignty. The two chapters on the various usages of the word *law* might perhaps bear to be yet further shortened; we doubt whether their subject is properly within the scope of jurisprudence. Professor Holland's definition of law runs thus:—"A general rule of external human action enforced by a sovereign political authority"—or, should we say, purporting to be enforced? for not every sovereign can make sure of enforcing his commands; and sometimes laws are made without even any great intention of enforcing them. We do not see why this should not come at the very beginning, with the statement that only such laws as answer this description are the subject of legal science. However, the opening chapters as they stand form a good introduction to the modern terminology. Proceeding to the theory of sovereignty, Professor Holland confesses and avoids Sir Henry Maine's criticism of the extreme analytical doctrine, and sums up his own result in these words:—"It is convenient to recognize as laws only such rules as are enforced by a sovereign political authority, although there are states of society in which it is difficult to ascertain as a fact what rules answer to this description." But the qualification seems to us not quite adequate in the states of society specified by Sir Henry Maine, and to this day prevailing over a large part of the earth, the difficulty is not merely to ascertain what rules of conduct are true laws, but to find any person or body answering the description of a sovereign political authority in the sense required by the analytical school. The half-dozen pages on customary law strike us as particularly good. Professor Holland brings out and harmonizes the elements of truth in the opposed views of the English analytical and the German historical jurists. Austin's contention that customary law "is nothing but judiciary law founded on an anterior custom" is disallowed as being repugnant to the facts. The Courts decide whether an alleged custom is or is not binding, not at their pleasure, but according to settled rules. The conditions on which the validity of a custom depends must be present, if they are present, before the case occurs for decision; just as the text of an Act of Parliament has the force of law when the Act is passed, though it may afterwards call for judicial interpretation. In this case the retrospective application of the construction arrived at by the Court is obviously necessary; and what takes place when a custom is allowed is essentially the same. Indeed similar considerations might be shown to apply largely, though not universally, to the declaration of rules of common law; so that in this sense, though not in the sense intended by Austin, his dictum above cited may be accepted.

In the chapter on Rights a series of definitions is carefully and elegantly worked out; the distinction between might, moral right (as sanctioned by existing positive morality), and legal right, is exceedingly well put, and ought to nip in the bud a good many fine flowers of confused thinking. The only point on which a little more explanation might be useful is the difference between positive morality and ideal morality, which is not expressly noticed. Legal right is defined as a capacity residing in one man (we should rather say "person," as man does not include artificial persons) of controlling, with the assent and assistance of the State, the actions of others. In popular usage we speak elliptically of a man having a right to use his property as he likes, and so forth; whereas his right is, accurately speaking, to prevent other people from interfering with his use. This does not, in our opinion, affect the correctness of the definition. With regard to persons as subjects of rights and duties ("Träger der Rechtsverhältnisse," as the Germans more neatly have it), Professor Holland has invented two new terms; he calls the person entitled "the person of inherence," and the person bound "the person of incidence." We doubt if these are necessary, but they are at least innocent. In his general classification of the subject-matter of positive law Professor Holland takes rights in preference to duties as the starting-point. This arrangement is perhaps the more easily understood at first sight, but we are disposed to regret the choice. It is impossible to arrange a body of law under a scheme of rights without some dislocation or repetition. After going through the categories of substantive rights, you have to start afresh with a catalogue of wrongs, consisting to a great extent in the breach of duties corresponding to the rights which have already been set forth. Another objection is that all rights have corresponding duties, while some duties (Austin's "absolute duties") have no corresponding rights, and therefore a classification founded on rights is by the nature of the case incomplete. But this is not admitted by Professor Holland, who maintains that the State's being the fountain of legal right does not prevent the State from having rights as well as any other artificial person, or even from having duties "such as it prescribes to itself," in so far as it submits to the jurisdiction and the decisions of its own Courts. This, we think, is just; yet there are various duties of a more or less public kind as to which it is not easy to say where the corresponding rights are, and cases are frequent in practice where there is no doubt as to the person bound, but the person entitled can be ascertained only after a fixed or precarious lapse of time, or by judicial decision between adverse claims. It is true that the devolution of duties (*e.g.* those attached to trust estates) is also at times difficult to trace.

It is satisfactory to find that Professor Holland retains the ancient and fundamental division of Private and Public Law, and disapproves rather summarily of Austin's curious aberration on this point. Few as English attempts at legal classification have been, we have already had far too much of straining after novelty for novelty's sake. One or two late writers, whose ambition is apparently to be the Blackstones of our time, have made their work all but worthless by deliberate confusion of the familiar boundaries. With regard to the troublesome question of the law of status and its due place in a system, Professor Holland starts from the citizen of full age and capacity as having "normal rights." Differences in status consist in departures or degradations from this normal capacity, which are attached to particular personal conditions, such as infancy or coverture. The rights and duties which arise from the relations of normal citizens to one another come naturally to be considered in the first place; then we consider them as they may be affected by the abnormal condition of one or both parties. "The inquiry into the law of Persons is thus supplementary and secondary to that into the residue of the law, commonly called the law of Things." To this it may be added that the law of Persons is more subject to historical and local variations, and more difficult to refer to any generally accepted principles. Take, for instance, the rules on such a topic as the contract of sale, as we find them in the *Corpus Juris*, and as they now exist in any State of the civilized world, and then make the like comparison as to marriage and its legal incidents and consequences. In the first case the differences will be appreciable; but—whether as between the Roman and any particular modern system, or as between the laws of different modern States—they will be trifling as compared with those which strike us in the second. At the same time the importance of the law of Persons as compared with the law of Things is ever on the wane in modern systems. In Hindu law the family and caste are everything, and equal rights of equal individuals are next to nothing.

* *The Elements of Jurisprudence.* By Thomas Erskine Holland, D.C.L. &c. Oxford: Clarendon Press. 1880.

In the world of modern law, caste and slavery, the great ancient heads of personal inequality, have disappeared, and the law of Persons is but a fraction of the whole body. These are additional reasons for putting the law of Things, with Professor Holland, before the law of Persons; and yet we confess to a certain lingering prejudice in favour of the Roman arrangement. As to the nomenclature, there is a little awkwardness in using the term "abnormal" for a condition such as infancy, through which every natural person has to pass, or the existence of a corporation, which is not only familiar in every civilized country, but is really an extension of the power of the individuals composing it. But it is etymologically appropriate (see Professor Holland's declension-diagram on the model of the old grammars at p. 225), and nothing better has yet been proposed.

Professor Holland speaks of "antecedent" instead of primary or sanctioned, and "remedial" instead of secondary or sanctioning rights. It occurs to us that "substantive" and "adjective" might do as well, and mark more distinctly the relation of rights to procedure. We have already "substantive law" and "adjective law," the latter being the law of procedure. Now remedial rights are the rights with which the law of procedure is concerned. Primary or antecedent rights are enforced only through the medium of these, as there can be no proceeding except by some one who has a right to proceed. Why not, then, use the term "adjective rights" for the rights which are worked out by adjective law? Moreover the term "remedial" is not always appropriate; there are proceedings, such as interpleader and payment of money into Court by a trustee, where the first step is taken by a party who seeks to be relieved, not against some one else's breach of duty, but against the risk of unwilling breach of duty on his own part. That in so doing he exercises a right is clear; but it can hardly be called either sanctioning or remedial.

We need not follow Professor Holland minutely through the various topics of Private Law. On the law of ownership it is neither easy nor desirable to say anything very new, though, in mentioning what things cannot be property, Professor Holland makes the rather sweeping statement that "air *and water* are obviously for the free use of all mankind." As regards water there is obviously a great deal, such as ponds in private grounds, which is not for the free use of mankind in any sense, and still more, such as portions of rivers subject to rights of lower riparian owners, of which the use is not free in the sense of being unlimited. However, it is true that water running or standing in its natural state cannot be stolen; and Blackstone even speaks of "the elements of light, air, and water," as things which "must of necessity continue common by the law of nature." Under the head of rights *in personam*, Professor Holland makes a chapter of rights *ex lege;* we should prefer to say rights appendant or rights annexed by law, as *ex lege* in this sense is hardly good Latin. This term comprises the rights of husband and wife (because, though the existence of the state of marriage depends on the will of the parties, its incidents do not), with other family relations; trusts; the quasi-contracts of the civil law, the fictitious contracts of English law which were the subject of the old "common counts," and some other relations of a like sort arising from circumstances independent of contract. We do not find any notice of the analogous rights *in rem* which belong to the head of quasi-delicts in Roman law, and with us have been established by the class of decisions laying down the measure of an owner's liability for the safe keeping of dangerous things. Before entering on contracts proper, Professor Holland remarks in effect that the action in "tort founded on contract" of English law is from the scientific point of view anomalous, which is true; nevertheless the action in tort is, as matter of history, much the older; and it must be remembered that down to the Common Law Procedure Act the commonest form of action on contracts was a modified action on the case. There must have been a widely spread notion that even when the contract was not enforceable as such, say for want of formality, it created a kind of special duty of which a wilful or negligent breach would be actionable.

In the chapter on Remedial Rights it is said that, "so long as all goes well the action of the law is dormant"; we think it should have been added that so far as things do go well it is in some measure due to general knowledge that the law, if broken, will be enforced, and that thus the law is really most operative when least conspicuous. International law is happily described as "the vanishing point of Jurisprudence"; and here we leave Professor Holland on the verge of the ground specially assigned to him by his office, on which, however, the plan of his work forbids him now to enter at any length.

RAILWAY ROMANCES.*

THE sentimental argument against railways—that they spoil the picturesqueness which belonged to "the country," whether here, on the Continent, or across wider seas than divide us from other European lands—has been frequently employed, and has no doubt something to back it. It is true that the vast power and speed of an express train as it dashes through a station, or the long curling line of smoke left by an engine to mark its track across a distant landscape, have in them something which must seem in different ways striking; but the fact remains that wherever machinery comes in, primitive beauty must give place, and that many quiet and pretty places have been rendered hideous and noisy by the increase of railway enterprise. Yet the "resonant steam-eagles" are not without their own romantic attractions. They have given many newspaper correspondents the opportunity of writing fresh and picturesque "copy"; they have inspired Mr. Alexander Anderson, "surface-man," to write some very vigorous and telling verses; they have afforded countless catastrophes to novelists, good and bad, in many languages; and, lastly, they have provided M. Camille Debans with an occasion for a somewhat new and decidedly successful literary venture. The volume called *Les Drames à Toute Vapeur* does not deal entirely with railway life—indeed two striking stories contained in it have nothing to do with steam-power—but the greater number of the tales collected in the book are directly concerned with railways, and seem to warrant the heading prefixed to this article.

M. Debans attracts one first as the *romancier* of the railway, secondly as a very skilful and forcible manipulator of the French language. His description in "L'Ile de Feu" of unknown portents in an unknown country is not unworthy of the master under whose influence it seems to have been conceived; but, before we get to this, our attention is arrested by the simple pathos of the pointsman's story ("L'Aiguilleur") and the "nouveau frisson" suggested by "Sombreker." The motive of the pointsman's story has been used before; but there is real freshness in M. Debans's treatment both of the horrible wavering in the old soldier's mind between paternal love and discipline, allied with a sense of duty to a mass of fellow-beings, and of the final event which rewards virtue. "Sombreker" is a new study, and, as we have hinted, suggests a new horror. The principal personage who gives his name to the story is an engine-driver, son of an old fisherman of dauntless courage, which he has inherited along with some, other strange characteristics. When Sombreker was a boy, he was out with his father in the fishing-boat that was the resource of the family, and a violent wind obliged them to run out to sea rather than seek a dangerous return to the shore. While his father strained every nerve to combat the storm, "il vit son fils, debout sur la frêle embarcation qui craquait, regarder insolemment le ciel et la mer dans un défi. Il semblait savourer l'orage. Le vieux Sombreker se ressouvint alors que son fils avait été conçu pendant une nuit où le vent et le tonnerre faisaient fureur. 'Il sera le roi de la mer si je deviens assez vieux pour en faire un capitaine,' pensait souvent le pêcheur." The old fisher however did not live to see this dream realized, and Léger Sombreker, when he grew up, became an engine-driver on the Lyons railway. He married, and had one son, to whom he was devoted. "Voir grandir son fils, vieillir avec sa femme et dévorer l'espace sur sa *Durance*—c'était le nom de sa machine—voilà toute sa vie." He was respected both by his mates and by his superiors for his skill and his excellent conduct, and this respect was increased by a daring act of gallantry which he performed one day. A child was seen standing straight in the path of the advancing train, and paid no attention to the shouts of Léger and his stoker. Léger made his way to the front of the engine, "s'accroupit, emboîta son pied derrière l'une de ces énormes lanternes qui sont comme les yeux du monstre, et se laissa aller ainsi, suspendu la tête en bas." The stoker cried to him, "You are mad, you will kill yourself"; but he paid no attention to anything but the figure of the child, which to him, in his strange attitude, seemed to be advancing towards him with violent rapidity. Suddenly the stoker threw out his arms and closed his eyes. "Un cri retentait aux oreilles du pauvre homme, puis il entendit pleurer l'enfant. Sombreker, se relevant à moitié, s'accrocha d'une main à la lanterne, de l'autre il tenait pressé contre lui le petit être ahuri."

One day the usually impassive Léger was found in the engine-shed giving way to a furious storm of passion because some one had made a great stain of paint on his locomotive. The violence of his rage, and the caressing epithets which he addressed to the *Durance*, made the bystanders suspect that there was something wrong, and the directors were warned of it by several anonymous letters, to which however, knowing Léger's excellent qualities, they paid no attention. Soon after this he ran through Melun and Fontainebleau at full speed without stopping, to the disgust of all the passengers who had taken tickets for those places. Even this was forgiven him, and the chief engineer, who administered a severe reproof to him, failed to see anything strange or alarming in Sombreker's manner. Presently his madness, still unsuspected in spite of his increasing devotion to the *Durance* and neglect of his wife and child, burst out in a terrible way. He started from Paris with his wife and his child, Yvon, in the carriage next to the engine, a circumstance which tended to reassure Chaussang the stoker, who since the Melun incident had no great love for travelling with Léger. At Montereau Léger got down to speak to his wife and Yvon, and when the train started again he put on full steam. The passengers said to each other, with the "sourire jaune" which is common in such circumstances, "Nous allons un train d'enfer." As the train neared Sens, Chaussang thought it was time to slacken speed. "We are coming to Sens," he observed. "Well?" replied Léger. "We must stop." "Stop!" cried Léger; "we have scarcely begun to move. Stop! Understand this. We shall stop when we have gone round the world." And with these words he increased the pace of the *Durance*, in which for a long time past he had secretly been making certain alterations with a view to getting from her a higher rate

* *Les Drames à Toute-Vapeur.* Par Camille Debans. Paris: Plon et Cie.

of speed. Chaussang appealed and threatened in vain. Léger only replied by laughing in the very frenzy of his delight. They rushed through Sens at lightning speed. By this time alarm had seized on all the passengers, except a newly-married couple in one carriage. "Les amoureux et les fous, c'est tout un. Sombreker et les deux mariés étaient les seuls qui fussent calmes en ce moment." In the other carriages scenes of a harrowing kind took place. The telegraph had been set in motion to clear the way for the mad train, and from every place that it passed messages were sent to the chief office at Paris. At Dijon Chaussang, who at first had been overwhelmed by the vastness of the catastrophe, recovered his presence of mind. He shouted Yvon's name in Léger's ear, but without effect; and he then tried what force would do. As the train flashed through Dijon the crowd of spectators caught a glimpse of two men struggling violently on the engine. The fight was fierce and brief, and Léger won it. When he saw the stoker lying exhausted on the coals he addressed the *Durance* with cries of triumph and encouragement, and breaking the stem of the safety-valve he covered it with an enormous mass of coal. "'C'est donc le diable!' grommela Chaussang. 'Cette fois c'est bien fini.'" Then he made his way to the first carriage, and at the risk of his life and of the child's, and in spite of its mother's violent resistance, he carried Yvon back to the engine with him. All that he gained by this was the warm thanks of Léger, by whose side Yvon stood, delighting as much as his father in the furious and ever increasing speed of the train. Then a man in the first carriage took out a gun which he had with him and fired at Léger without hitting him; but, before he could repeat the attempt, Marie, Léger's wife, tore the gun from his hand and flung it out at the window. Meanwhile one of the back carriages caught fire. Certain sounds on the engine told Chaussang that the end was approaching. Water at the same time was wanted for the boiler, and Chaussang knew that, if it was supplied, the final catastrophe would take place at once. With a cord which he had got from a passenger, he tied up the tap of the reservoir, and the time it took Léger to undo the fastenings just sufficed for Chaussang, carrying Yvon in his arms, to unfasten the couplings of the engine:—

La locomotive essoufflée ayant elle-même été poussée par le train, le chauffeur avait pu dévisser le lien et détacher les chaînes. Il était maintenant debout sur le tampon, cramponné d'une main à son bâton de houx, de l'autre soutenant l'enfant de Sombreker. La locomotive dégagée du poids du train, avait pris un nouvel élan, et filait avec la vélocité d'une balle. Les wagons, par suite de la vitesse acquise, roulèrent longtemps encore, mais en abandonnant bientôt cette rapidité vertigineuse. Les serre-freins, qui virent partir la machine en avant, serrèrent les roues avec fureur, et quelques instants après tout le monde était à terre. Un seul homme ne quittait pas sa place. C'était Chaussang. Il regardait la *Durance*, qui était déjà à huit cents mètres. Des ongles et des dents, Léger avait fini par dégager le robinet des cordes qui l'enlaçaient. On entendit comme une décharge d'artillerie. On vit des débris s'élever vers le ciel. La *Durance* avait volé en éclats, et le mécanicien Sombreker venait de sauter avec elle en poussant des cris de victoire.

Having given this brief account of one of M. Debans's striking stories, we do not propose to spoil his readers' pleasure by giving any particulars as to the remaining stories. Perhaps the best of them are "L'Ile de Feu" and "Le Cheval Fou," while the "Duel à Vapeur," a piece of extravagant humour, is the least successful. But the whole book may be safely recommended.

BEAUTY'S DAUGHTERS.*

BEAUTY'S Daughters, as we know to our cost, is the third novel for which we are indebted to the anonymous author in the course of the last three years. We see no sufficient reason why she should not have written thirty, if her constitution and mechanical powers were only equal to the task. For novels of this kind need not involve the slightest strain on any one of the inventive faculties; and, having once struck into an easy line of her own, she follows it with an undeviating persistency which simplifies matters exceedingly. As we think we have had occasion to remark before, she seems to have taken for her models such lively feminine novelists as Miss Rhoda Broughton and Miss Helen Mathers, aping their unconventional methods and their more objectionable mannerisms, though at a great distance from them in point of ability. She has all their flippancy with none of their talent; yet, to do her justice, her style is in some respects original, and in its way it is very unmistakably realistic. She skims the most frivolous aspects of society, and evidently considers low comedy in dialogue to be her forte. Page after page, chapter after chapter, we have an exceedingly minute and exact reproduction of the very dullest and most vapid of small talk. Small as is the talk, still, as a rule, it is laboured—which at all events gives evidence of a certain conscientiousness; while we must add that she shows some retentiveness of memory, with a facility of adaptation within the range of her reading. When anything by comparison with the rest has the cheerful reflection of a sparkle, the chances are that it will be found to be travestied or taken without acknowledgment from the fancy of some popular novelist or poet.

The plot of *Beauty's Daughters* turns mainly on the vagaries of jealousy, or of the passions which may be supposed to pass for love. The author's characters, in the undefined inconsistencies of their outlines, are all of almost identical type; and, though they flutter through their volatile existence in the most fashionable circles, their free-and-easy manners are brusque to roughness, while their conversation is vulgar, and sometimes almost coarse. As for their behaviour in the love-scenes which are perpetually recurring, of that we shall have more to say presently. Little as they have profited by education or by their social opportunities, all have been marvellously gifted by nature and fortune. The girls—the Daughters of Beauty—are lovely enough to play the parts of so many Viviens even with sages like Merlin; and, in fact, they have the masculine world at their feet, struggling or intriguing for their smiles or their hands. Nor are the men unworthy to aspire to such transcendent charms, whether from the point of view of the daughters or of their more practically minded mothers. Every man of them appears to have been born with a silver spoon in his mouth, save one, who is subsequently compensated for his original impecuniousness by succeeding to a peerage with 8,000*l.* a year. This 8,000*l.* a year is relatively very modest; for, as a rule, when the author condescends to pecuniary details, she gives her eligibles at least 15,000*l.* per annum, with sundry magnificent seats in the country and sumptuous mansions in town. But of course, in summing-up a lover's recommendations, a coronet must count for a good deal. Nor is it wealth alone that has fallen to the lot of those singularly fortunate sons of prosperity. Every one of them might stand to a sculptor for an Adonis, though the godlike gifts of form with which they are invested are made to vary so as to suit a variety of tastes. And if the author is compelled occasionally to repeat herself in dashing in their portraits with her glowing colours, we cannot find it in our heart to be hard upon her. No ordinary ingenuity could be equal to ringing the changes in the fervid epithets which her descriptions demand. By way of showing her descriptive powers at their best, we shall venture to make one or two quotations at haphazard; though by being capriciously torn from their settings, the gems may lose something of the lustre that should blind us to their flaws. Here we have the family group of the Tremaines—a group which includes enchanting sister-heroines, of the mystic number of the Graces, and the Fates, and the Goddesses who contested the apple on Mount Ida. The Tremaines "are all handsome—the Tremaines would have scorned to acknowledge an 'ugly duckling.' For generations such a thing had not been so much as hinted at among them. Mrs. Tremaine, though arrived at that age when the question of birthdays is viewed with disfavour, is still very good to look at, and eminently aristocratic. She rejoices in the thin, transparent nostrils, the fine lips, the pale blue eyes, and high white brow that are generally supposed to belong by right to blue blood." Moreover, she has "a lingering perfect smile"; and we would call special attention to the nervous idiomatic English which describes her as "still very good to look at." We take the well-preserved Mrs. Tremaine to be a unique illustration of the effects of judicious grafting in the human species; for although the lady was no Tremaine by birth, it is implied that she had acquired the looks of the family by marriage. Her only son Brandrum, familiarly and habitually known as Brandy, "has curly hair and blue eyes, and a smile like a cherub; and women, as a rule, pet him more than is good for him." So apparently does the War Office; for, though he tells us himself that he and his colonel are at daggers drawn, yet he manages to get leave all the year round from his regiment. The portrait of his second sister, Gretchen, suggests a masterpiece by Greuze in its exquisite poetry of cream and carmines. "Pretty Gretchen! with her pale pure face, and little Grecian nose and great blue eyes, that remind one of nothing so much as the sweet Czar violet. She is two years younger than Kitty, and smaller and slighter, with an expression unspeakably calm and tender. To think of Gretchen is to think of moonlight, or the soft perfume of roses, or faint strains of music. To see her is to love her. To know her is 'a liberal education.'" As to what this last assertion may mean we have not the faintest conception, more especially as, for anything we learn from her to the contrary, Gretchen's own education has been utterly neglected. But, as Thackeray somewhere observes of a bit of his most eloquent burlesque, we cannot help thinking it is "mighty pretty writing." Then for the companion "portrait of a gentleman" we may turn to that of Gretchen's future husband. "A very tall young man, and, though somewhat slight, finely formed. He is fair, with that rich nut-brown hair through which soft threads of gold run generously; his face is not so much handsome as very beautiful. His eyes are large and of an intense blue; eyes that, before misfortune clouded them, were friends to laughter, but are now sad with unutterable melancholy. His mouth beneath his light moustache is tender and mobile but firm," &c. Nor is the mistress-touch less playfully vigorous in its frolicsome treatment of inanimate nature. In the room where Gretchen makes Kenneth's acquaintance, where her heart is filled with "a great and sudden pity" as she meets those eyes clouded with misfortune, "the fond little sunbeams, too, lest they should be forgotten, have stolen in and are flecking all they touch with gold."

But lest the exquisite pathos of this somewhat sombre interview should be too much for the feelings of our readers, we must lead them away among brighter and happier love-scenes. Successive chapters are as resonant of kisses and expressions of endearment as ever were the groves of the island of Cytheræa or the love-sick lyre of Anacreon. Kissing fills as conspicuous a place in *Beauty's Daughters* as in *Phyllis* or *Molly Bawn*. In their amorous drollery the young ladies are always suggesting to their lovers

* *Beauty's Daughters.* By the Author of "Phyllis," "Molly Bawn," &c. London: Smith, Elder, & Co. 1880.

that they have forgotten to kiss, or that they might like to kiss, or that they may hope to be rewarded with a kiss, or punished by a kiss being withheld; while similar jokes are worked out at unquestionable length and in questionable taste in sprightly dialogues between wife and husband. That we may do full justice to the refinements of the author's style, we shall make another extract from one of these sparkling conversations. Should our readers find it dull, we can hardly recommend them to read the novel. Gretchen has been married to Kenneth of the eyes clouded by misfortune, who, through the skill of a rising young surgeon, has been put in a fair way of being cured of an accident that had crippled his spine. Thinking of a natural mode of expressing her gratitude to her husband's benefactor, she says:—

"Do you know, Ken"—solemnly—"I almost feel as if I could kiss him."
"Oh, don't, you know," says Mr. Dugdale, mildly, "I really wouldn't, you know, if I were you. He wouldn't like it. It would frighten him to death. And then it would be such a horribly one-sided affair, you see. I'm positive he wouldn't return it. Think of the disgrace of that!"
"That, on the contrary, would be another inducement to do it. Well, perhaps I may not go so far as to embrace him, but I shall certainly want to do it all the time."
"Poor Blunt!" says Kenneth.

There is a certain "Fancy" Charteris, a most fascinating widow, who has more to answer for as a mischief-maker than anybody. She is a professional beauty, whose position is so strong that she can afford to snub an exceedingly grand Duchess who has dared to be uncivil to her. Among all the men whom her witcheries have befooled, none behaves more idiotically than Mr. Arthur Blunden, who was originally introduced as an unimpressionable cynic whose strong point was shrewd common sense. "Fancy" has lured him on to throw him over, by way of revenge for his having spoken contemptuously of her. But the lady has been snared in her own bird-lime, and, after a passionate scene or two, in which she does the better half of the love-making, she surrenders at discretion, accepting him for her husband. We should have fancied that, knowing well what she is, if Blunden were really rash enough to wed her, he would have kept the upper hand till he led her to the altar. But not a bit of it. She befools him and plays fast and loose with him as before, and they are perpetually quarrelling, separating, and making it up again. Here we have a specimen of one of their reconciliations. She professes to doubt his protestations that he loves her a thousand times better than anything on earth:—

"Why?" says Arthur eagerly.
"Because"—coquettishly—"you have been here nearly ten minutes, and—"
"Yes?"
"You have never once kissed me," murmurs she, most unfairly, considering all things.
"My darling, how could I, when every glance you gave threatened to slay me? Fancy, is this just, or honest, or even kind?"
"If I am unjust, and dishonest, and unkind, as your words seem to imply, I wonder you stay with me. Why don't you say a harder thing still, and tell me I am ugly? And—I shan't have a whole bone left in my hand, you know, if you insist on holding it much longer! . . . To begin with, then, you may kiss me once—only once, mind—or, I warn you, I shall be dreadfully angry."

Nay, even the impassible Brandy Tremaine and his bosom friend "Dandie" Dinmont kiss and make friends again when they had quarrelled over Mrs. Charteris, precisely as if they were Gustave and Adolphe in a French vaudeville. There is a passage remarkable for its *naïve* unconsciousness of the nature of her work, in which the author expresses devout gratitude to a certain Lady Cyclamen for neglecting to make some investigations. Had Lady Cyclamen cleared up certain misapprehensions, "this third volume would have been nowhere." For ourselves, as we need hardly say, we feel anything but thankful to Lady Cyclamen. She is perhaps one of the least objectionable persons in the story; but had her negligence spared us two of the volumes, we should have been still more prepossessed in her favour.

GERMAN LITERATURE.

THE late Marquess Gino Capponi (1) is one of the most interesting figures of modern Italian society, alike as a distinguished member of one of the chief centres of intellectual cultivation in Italy, and for the remarkable destiny which gave him his principal celebrity as an author and a statesman after he had been afflicted with total blindness. The designation of statesman may seem to be in excess of the claims of one whose political career was so brief, and whose tenure of office was from the first avowedly provisional; but Capponi was significant as a type of the moderate, cultivated, sincerely patriotic Italian Liberal, whose misfortune it was to have been born too soon to have imbibed the national passion for unity, and to have fancied until a very late period that his countrymen would consent to be Tuscans when they could be Italians. He adhered to the Austrian ruler of Tuscany as long as he could; but the events of 1859 finally effected for him what they have failed to effect for his biographer, whose panacea for Italy is at this hour to "restore the heptarchy." With these prepossessions on our author's part, Capponi's opinions may not impossibly have received a tinge which he himself would have disclaimed. In every other point of view Herr von Reumont is most fully qualified for the office of biographer by his intimate knowledge alike of the deceased and of the circle in which he moved. Giusti, Giordani, Colletta, Tommaseo, Guerrazzi, and other eminent Italians are carefully portrayed; and Capponi's relations to such distinguished foreign visitors as Ampère and Mrs. Somerville are not overlooked. As an author, Capponi's fame will rest principally on his *History of the Florentine Republic*, one of the few modern Italian books which will take rank as classics, and especially remarkable as the work of a man bereaved of sight and stricken in years. His literary activity was in other respects considerable and influential. He was a leading member of the Accademia della Crusca, bestowed considerable attention upon Italian philology, especially in relation to the popular speech of Tuscany, and laboured with great effect in the arrangement and publication of the Tuscan archives and in popular education. He would have been a perfect model of the aristocratic man of letters and affairs had his perception of the tendencies of his times been more lively and accurate. He has been fortunate in meeting with a biographer who shares his views and feelings to an extent which might hardly have been the case if his life had been written by an Italian.

(1) *Gino Capponi. Ein Zeit- und Lebensbild.* Von Alfred von Reumont. Gotha: Perthes. London: Williams & Norgate.

Professor W. Müller (2) cannot be blamed for deeming the history of his own country of capital importance; it is nevertheless the fact that the prominence thus accorded to German affairs renders the history of a dull year duller than it need have been in the hands of an historian of more comprehensive views. The history of Germany for 1879 is mainly one of injudicious changes in the tariff, abortive negotiations with the Pope, and an electoral victory for Prince Bismarck which has so far failed to bring forth the fruits of victory. Nihilist assassinations, Cabul massacres, and the tragic end of the Prince Imperial, afford almost the only picturesque incidents of the year, and only the first-named offer much scope for an historian like Professor Müller, who is everywhere accurate and reasonably impartial, but to whom all occurrences are interesting in the ratio of their liability to affect Prince Bismarck.

Herr Julius Harttung (3) very candidly disclaims all expectation that any reader of his book will read it long. This modest diffidence is undoubtedly well grounded; yet the fault is not with the author, but with the subject. No human ability could make Herr Harttung's investigations lively; but they are in nowise uninteresting or unimportant, relating to the wholesale fabrication and falsification of charters and similar documents in the middle ages, a point which evidently has the most direct bearing upon the authenticity of history. He selects the archives of the Abbey of Fulda as the principal object of examination, and, by a course of reasoning intelligible only to experts, endeavours to show that they are very largely falsified and interpolated. He even suspects that the monks of Fulda made a trade of forging documents for other monasteries.

The memoirs of J. E. Bollmann (4) are exceedingly interesting, alike on account of the adventurous character of the hero, and of his intimate connexion with many persons of distinction, both in the Old World and the New. Bollmann was a West Indian who, when a medical student at Paris during the French Revolution, made the acquaintance of Mme. de Staël, and was induced by her to procure the escape of the Count de Narbonne, in which he succeeded. He then undertook a more adventurous enterprise of the same nature—the deliverance of Lafayette from his imprisonment in Olmütz. The failure of this undertaking, which however had all but succeeded, consigned Bollmann himself to an Austrian prison. Upon his liberation he proceeded to the United States, where his exertions in Lafayette's cause recommended him to Washington, of whom he has left a just and striking portrait. He was nevertheless unsuccessful in business, incurred a prosecution by his reputed share in Burr's conspiracy, and only towards the close of his life began to retrieve his fortunes by his connexion with the house of Baring, which employed him on several commissions. His letters are highly interesting as testimonies of the impression made by the young American Republic upon a vigorous and sanguine nature.

The splendid illustrated work on Spain (5) by Herr T. Simons and Professor Alexander Wagner has reached Part VI. The latter parts are chiefly occupied by a description of Madrid, rich in delineations both of public buildings and of the manners of the people. All the sketches of the latter are most lively, especially those devoted to the national amusement of bull-fighting. Two of Velasquez's superb realistic portraits are also engraved on a large scale. The text is clear and interesting, and the work, as a whole, should be equally attractive to those who have and those who have not seen Spain.

The studies of Herr Victor Schultze (6) in Christian archæology are somewhat desultory, and the book as a whole is not very readable. It may, however, serve as a useful book of reference on many points, especially as the writer displays considerable inde-

pendence of judgment, and is not afraid of contradicting Garrucci and other recognized authorities. For Garrucci's judgment, indeed, he displays but scant respect, and accuses him of highly idealizing his representations of the objects depicted by him. Garrucci, with Rossi and Marchi, and Italian archæologists in general, are also, he maintains, liable to the reproach of unconsciously perverting scientific research to dogmatic ends. On this point the monuments themselves speak sufficiently in Herr Schultze's favour. It must require strong prepossessions indeed to behold, with De Rossi, "a sublime epic of Christian dogma" in a sarcophagus sculptured with representations of the most ordinary subjects from Biblical history. Nothing is more characteristic of early Christian art than its undogmatic character; it may almost be said that for the first three centuries only two dogmas are expressed by it, Baptism and the Resurrection. The earliest representation of the Virgin and Child belongs to the second half of the second century, and is conceived in a purely human spirit. St. Peter is never represented apart from the other apostles until the time of Constantine. The Good Shepherd is the centre of Christian symbolism up to the establishment of Christianity as a State religion; the famous monogram of the fish is the watchword of the persecuted community; and, whatever of Biblical illustration may occur, as in the instances of Moses and Jonah, is usually typical of the baptismal ceremony or the doctrine of the Resurrection. Herr Schultze has also some valuable remarks on the æsthetic character of early Christian art, which derived its vitality entirely from classical art, and participated in the decay of the latter.

Another book relating to Christian symbolism is W. Rossmann's exceedingly agreeable account of his visits to churches, convents, and shrines in Italy and the East (7). The author of *The Coast of the Cyclop and the Sirens* is a man of the highest culture, and he has brought not only great attainments, but a liberal and tolerant spirit, to the subject of his present scrutiny. In a series of chapters on the services of Passion Week at St. Peter's he interprets their symbolism and traces the numerous vestiges of more ancient rites which they exhibit. Another essay treats of the Ammergau Passion Play, describing the actual representation as it now takes place, and pointing out its analogies to the originally religious inspiration of the Greek drama and to the miracle plays of the mediæval period in general. A history of the Ammergau performance is appended. Another chapter contains a circumstantial and highly interesting account of a visit to Mount Athos; while another describes the Holy Places at and near Jerusalem, with a description of the ceremonial of Holy Week. Herr Rossmann's leaning with regard to the identity of the sacred spots is usually in favour of the received tradition.

Dr. Luthardt's (8) discourses on the practical consequences of modern philosophical and religious theories are chiefly designed to establish the pernicious consequences of the rationalistic principle. Unfortunately, among these consequences he enumerates such things as free trade and the abolition of the theatrical censorship; he would even re-enact the usury laws. It seems altogether too humorous to persuade a subject of Prince Bismarck that he suffers from an excess of liberty; and religious orthodoxy is ill served when it is represented as inevitably associated with a reactionary spirit in politics.

The preface to Dr. Erdmann's edition of Kant's *Kritik der Urtheilskraft* (9) contains some interesting remarks on the state of the text, and Kant's style of composition in general. It appears that he had a singular indisposition to correct the press himself.

The late Ferdinand Hitzig's lectures upon Biblical theology (10) and the Messianic predictions of the Old Testament are rather notes than finished compositions, and are necessarily dry reading for those who do not possess that familiarity with the subject which the Professor expected from his audience. By readers thus qualified they will be found interesting and suggestive, especially for the discrimination between the mythical and genuine Messianic prophecies, the connexion of the latter with theocratic ideas, and the excursuses on such controverted points as the meaning of "Servant of Jehovah." A memoir of the author and some specimens of his correspondence are appended. Hitzig appears to have been the type of a German professor in everything except his entire freedom from haziness of thought and expression; blunt, uncompromising, simple-minded but acute, and not without a touch of austerity, derived perhaps from the Hebrew writers to whom his life was devoted.

It is little to the credit of England that one of the most important of Wickliffe's controversial tracts (11) should have been left to be edited by a German, while others, it appears, have not as yet been edited at all. The importance of the great English Reformer's treatise "On Christ and Antichrist" does not so much consist in any special novelty as in its representing the ultimate phase of his opinions, having been composed in the last or the penultimate year of his life. Its tone is uncompromisingly anti-Papal, although Wickliffe still hesitates to pronounce the Pope necessarily Antichrist, except in so far as his personal conduct may be anti-Christian. The argument is clearly and logically drawn out, and, as Dr. Buddensieg observes, the invectives against the Papacy which, when cited apart from their context, afford ground for charging Wickliffe with intemperance and acrimony, wear a different appearance when read in their proper connexion. The complete publication of Wickliffe's writings is therefore desirable in the interest of his reputation.

Professor Sprinzl's work on the theology of the Apostolic Fathers (12) is a genuine scientific treatise such as the Roman communion rarely produces in these times, and will sustain a comparison with any Protestant work of its class in point of impartiality and objectivity. The principal drawback to its value is the serious doubt whether, with the exception of Clemens Romanus, any of the Fathers of whom it treats deserve to be regarded as Apostolical in any sense. In the present state of the controversy, Professor Sprinzl cannot be taxed with credulity in ascribing Barnabas and Hermas to the first century, and maintaining the genuineness of the shorter recension of the Ignatian epistles, although the latter thesis involves the admission that saints and martyrs may be very commonplace and uninteresting in their capacity of authors. The curious thing is that, after having ably defended the genuineness of these writings on the ground of external testimony, when he comes to the Epistle to Diognetus he shifts his ground, and, on the score of what he regards as satisfactory internal evidence, confidently refers this wholly unauthenticated production to the very beginning of the second century. No rationalizing theologian ever trusted more to his inner consciousness. It must be admitted that, without Ignatius and Diognetus, Dr. Sprinzl must have renounced the attempt to extract a coherent system of theology from the scanty literary remains of the early Church.

The zoological and anthropological section of the Encyclopædia of Natural Science, edited by Dr. G. Jäger (13), has advanced to the end of letter B.

Although Germany is the land of philologists and grammarians, German grammar and orthography are notoriously in an unsettled condition. Herr Andresen (14) has done his part towards the attainment of a uniform standard by an interesting volume, pointing out a great number of the inaccuracies and ambiguities frequent in modern German prose, especially newspaper prose, showing at the same time what ought to have been said, and why. His book is commendably free from the acerbity which has characterized some essays of a similar purpose in England.

The most recent volume of the International Scientific Library is a full but compact treatise on the mechanism of the vocal organs, by Professor von Meyer (15).

The first part of a series of philological essays, to be published at irregular intervals by A. Kiessling and U. von Wilamowitz-Moellendorff (16), proceeds almost entirely from the pen of the latter, and is devoted to the history and polity of Attica. The principal contents are an oration, which must have excessively taxed the patience of the auditors, on the grandeur of the Athenian Empire, followed by eleven excursuses on points connected with the same, for which room could not be found in the discourse. An elaborate essay on the municipal history of Athens from Cecrops to Pericles is of a piece with the rest. While, however, Herr Wilamowitz's disquisitions are surcharged with matter, his style would be a model of brevity were it not also a model of baldness. It is not quite apparent whether he considers himself to be in any degree expounding or popularizing his subject.

The "modern Egyptian" of Herr Adolf Erman's grammar (17) does not denote, as might have been conjectured, the Coptic, but the ancient language as it existed about the time of the Twentieth Dynasty. The author's reason for the selection of this particular epoch is the greater adaptability of the literary monuments belonging to it to the purposes of philological science. The grammar is lithographed, it is very copious, and the patronage of so distinguished an Egyptologist as Lepsius justifies the inference that it is very valuable. The examples are exceedingly numerous, and are given both in hieroglyphic and in a transliterated form. As, however, some preliminary knowledge of the subject is assumed, no explanation of the art of reading hieroglyphics is given, and the book will be serviceable to those only who have already made some progress in Egyptian studies.

In *Brigitta* (18) Berthold Auerbach has returned in a measure to the manner of his first village stories, and with good effect. This pathetic tale is put into the mouth of a woman whose narra-

tive preserves the attractiveness of the simple story of a humble person, avoiding at the same time the frequent triviality and tediousness of such narratives. The only question is whether the art that simulates nature is not sometimes rather too apparent. The moral tone is admirable throughout.

The extraordinary popularity of the "Mirza Schaffy" (19) songs in Germany has always been a surprise to foreign students of German literature. Popular in a measure they might well be; but one would not have expected lyrics professedly in the Oriental taste, however thin the disguise of Orientalism, to have attained in the Western world the circulation of a Longfellow. To readers unacquainted with the original, Mr. d'Esterre's translation will but deepen the mystery. His verbal fidelity is commendable; but the gaiety of the text, itself nowhere overweighted with meaning or feeling, becomes in the translation mere commonplace.

The Sanscrit poet Kalidasa (20) has been much more fortunate in his translator. His *Meghaduta*, or "Messenger Cloud," a poem remarkable for its brilliant descriptions of Indian scenery, is rendered by Herr L. Fritze into animated and sonorous verse. It is only to be regretted that Herr Fritze has not adopted the genuine octave stanza, instead of a modification which seriously impairs its rhythmical balance and symmetry of form.

THE TURKISH QUESTION.

THE Turkish question remains, and is likely to remain, unsettled. Lord GRANVILLE is happily able once more to announce the continued union of the Great Powers; but the policy in which they are united is still a diplomatic secret. There appears to be no insuperable difficulty in the cession of Dulcigno to the Montenegrins. According to some reports, the Porte had with much ingenuity offered to surrender the district of Tusi, because it was known that the possession of the province was regarded by the Albanians as indispensable. It appears that they are less unwilling to part with Dulcigno; and, while the more important dispute on the Greek frontier is still pending, the Turks may perhaps wish to relieve themselves of the Montenegrin embarrassment. Some of the Albanian tribes are supposed to desire to make themselves independent of the SULTAN; but it is thought at Constantinople that their insubordinate tendencies may be ultimately repressed, and that in the meantime they may be found useful as an excuse for the inability of the Porte to transfer a part of its dominions to Greece. If morality were closely connected with high international policy, little blame could attach to the Turkish Government for its passive resistance to the conclusions of the Berlin Conference. The mediation which was announced in 1878 has since been converted into a peremptory demand, which rests on no argument intelligible to the Turkish mind except superior force. The real justification of the measure is a probably well-founded preference of the Greek race and character; but Turks and Mahometans can scarcely be expected to acknowledge their own inferiority. The majority of the population of Epirus and Thessaly will welcome the change when it is effected. The Greek Government has, as might be expected, gratefully accepted the offer of an accession of territory, which nevertheless is only regarded as an instalment. There is no reason to fear that the Greek army will be prematurely set in motion to occupy the new provinces.

As no change has lately taken place, political observers have had leisure to speculate on the probable policy of the several European Powers and of the Turkish Government. It is not surprising that the arrival of some German officials at Constantinople should have attracted notice and comment. Lord GRANVILLE seems to have made inquiries of the German AMBASSADOR, not perhaps so much for his own satisfaction as for the purpose of enabling him to give answers to Parliamentary questions. Curious politicians have to satisfy themselves as well as they can with the information that the Porte applied several months ago to the Government of Berlin for the aid of some official experts in finance, and that Prince BISMARCK has after some delay lately complied with the request. It is barely possible that the transaction may have been perfectly simple, though Turkish Ministers have, for the most part, not troubled themselves to remedy administrative shortcomings. After the experience of Egypt, it is not surprising that English or French interference in financial affairs should be regarded with suspicion. The SULTAN will certainly not submit to the kind of superintendence against which the late Khedive ultimately rebelled. If German Under-Secretaries can find money for the Government and the Court without inflicting additional oppression on the taxpayer, their services will be welcome. Another object of the application may have been to improve the relations between Turkey and the most powerful of Continental States. If the hope is gratified, there will be no reason for regarding the combination with jealousy. The tardy assent which has been given to the requests of the Porte may possibly be intended as an indirect warning to Russia. The German Government may perhaps care little or nothing for the further disintegration of the Turkish Empire; but Prince BISMARCK cannot regard with indifference the risk of a general war. There is reason to believe that Bulgaria, Servia, and East Roumelia are preparing for a new attack on Turkey with the aid of Russian officers and soldiers, and at the instigation either of the Russian Government or perhaps of the Sclavonic societies which organized the former Servian war in preparation for the subsequent Russian invasion. The German Government may probably wish to indicate its disapproval of a turbulent policy.

If the Turks deserve their reputation for diplomatic skill, they may perhaps secure some compensation for a prudent deference to the decision of the Berlin Conference. The Great Powers have gone far beyond their original scheme of mediation; and, on the other hand, some of the rights to which Turkey was entitled under the Berlin Treaty have been withheld. If the Porte would frankly consent to evacuate Epirus and Thessaly, it would establish a claim to protection against the unprovoked hostility of Bulgaria and Roumelia. Even for the purpose of dissolving the temporary union of the European Governments, it would be expedient to dispose finally of the subject-matter of their agreement. The doubt which is felt as to their resolution to enforce their demands by joint action is far from approaching to a negative certainty. None of the Powers have probably pledged themselves to abstain from coercion; and the confidence which is expressed in English Ministerial statements must be founded on some definite grounds. If Austria were entrusted with the execution of the decree of the Conference, it would be unnecessary, and probably useless, for England or France to make any naval demonstration. The quiet cession of the disputed territory to Greece would perhaps produce a reaction of feeling in favour of a Government which has not been in all respects generously treated. The petty States which are clients of Russia might be disposed to avoid or postpone a collision if the Turkish army were at liberty to concentrate all its efforts on the defence of its remaining provinces. If the cession of Epirus and Thessaly were once accomplished, there is no reason why common fears and antipathies should not, at least for a time, produce a reconciliation between Greece and Turkey. The Greek inhabitants of East Roumelia have lately complained to the European Commission of the injustice and oppression to which they are in common with the Mahometans exposed. A Greek patriot generally wishes that the Turks should preserve the inheritance which he regards as his own until his country is in a position to assert her claims.

Unfortunately the balance of chances is against the acceptance of a judicious policy at Constantinople. The SULTAN, who really directs the Government, is opposed to all surrender of territory, both on political grounds, and because he fears to incur unpopularity among his Mahometan subjects. He is believed to be still engaged in intrigues with the Albanian insurgents for the purpose of defeating the

compromise which had been arranged with Montenegro. It may not be thought necessary to employ the same indirect methods in dealing with the question of the Greek frontier. The cession to Montenegro had been deliberately promised, while there are many plausible arguments to be urged against the demarcation of the frontier which was settled by the Plenipotentiaries and their assistants at Berlin. An acute intellect combined with an obstinate disposition may sometimes be incapable of appreciating a wise and comprehensive policy. The SULTAN knows that calculated delays have often baffled the designs of foreign statesmen in their attempts sometimes to injure Turkey, and often to introduce beneficial reforms. The danger of resistance to the demands of Europe is perhaps less constantly present to his imagination. The embarrassments which have survived the war and the Berlin Treaty afford the fullest justification of the policy which until lately was pursued by all English statesmen. Experience has confirmed the foreboding that the dissolution of the Turkish Empire would be a fertile cause of anxiety and of war. The prevention of the Russian invasion would, if it had been possible, have been a great benefit to the European Powers, if not to the new States which have been formed from Turkish provinces. The warning that the subject populations would, if they were emancipated, become dependents of Russia, has been confirmed by later events. Of all the Principalities which have thrown off the authority of the SULTAN, Roumania appears to be the most seriously disposed to exercise real independence. The Russian agents, who are everywhere and always engaged in promoting discontent and war, are far less successful to the North of the Danube than in Bulgaria and East Roumelia. The Greeks may probably in the future, as in the past, be less amenable to Russian influence than their Slavonic neighbours. It is probable that they will soon be deprived of the excuse for their political failures which they found in the comparative smallness of their territory and population. The process by which they are to enter on their new dominions is at present mysterious.

POLITICS IN THE QUARTERLIES.

BOTH the *Edinburgh Review* and the *Quarterly Review* contain, as might be expected, articles on the new Parliament, and on the actual or probable policy of the Government. The writer in the *Quarterly* seems to be the same resolute old Tory who some time since propounded the doctrine that the true remedy for all political evils was the revival of personal intervention by the Crown. In the present essay he takes no pains to disguise his disapproval of the first Reform Bill and of the abolition of the Corn Laws. It is useless to examine a contention which, if it were theoretically sound, would be wholly ineffective. If the alternative were the supremacy and uncertain policy of Mr. GLADSTONE and the restoration of the system which prevailed fifty years ago, all sections of the community would unanimously prefer present fears and uncertainties to a paradoxical reaction. It is useless to prove that some of the Duke of WELLINGTON'S desponding prophecies have been fulfilled half a century after the date which he would himself have assigned. The danger of democratic change is now more imminent; but in the meantime nearly two generations have, in spite of the DUKE'S alarms, enjoyed undiminished freedom and extraordinary prosperity. The interest which is felt by the present generation in O'CONNELL'S violence and intrigue is merely historical. An opponent of revolutionary measures ought to have some principle in common with the audience which he addresses. The *Quarterly Reviewer* has only one recommendation to make, and it is of a negative character. "It is not on the "question of the franchise that the Conservatives should "join battle with the Radicals." In other words, the Conservative party, having already been hopelessly weakened, would do well to commit suicide by surrendering what remains of county representation to Radical demagogues. It is not a recommendation of such a course that the moderate Liberals would be equally injured by the degradation of the county franchise.

The political opinions of the *Edinburgh Review* are less remote from real life and from possibility; and indeed the paper expresses with perfect fidelity the prevailing fear which a genuine Whig attempts in vain to combat by conventional professions of confidence. A list of the Whig members of the Government, which includes, for the purpose of strengthening the argument, the names of the Viceroy of INDIA and the Lord Lieutenant of IRELAND, might at first sight seem to justify the cheerful doctrine which was propounded in the same periodical three months ago. It seemed that Lord RUSSELL, faithful in his later years to the deepest conviction of his prime, had not long before his death assured the writer that, whenever the Liberal party was reconstituted, it would be on a Whig basis. The majority of the present Ministers still belong to the old Liberal party; and the Reviewer condescends to "attach "great value to the advice and co-operation" of Mr. BRIGHT, Mr. FAWCETT, Mr. CHAMBERLAIN, Sir CHARLES DILKE, and Mr. MUNDELLA. "But their opinions are not "the dominant principle of the present Ministry." Mr. FORSTER might have been added to the list of advanced politicians, though it is true that until lately there seemed to be reason for relying on his prudence and moderation. Mr. CHAMBERLAIN and the rest have not yet had an opportunity of originating subversive legislation; but it is no secret that the measures which are already introduced, combined with threats of ulterior innovation, have irritated and deeply alarmed, not only timid Conservatives, but every Liberal who is interested in the maintenance of property. There have been Cabinets in which several independent Ministers controlled to a great extent the policy of their chief. In a remarkable letter to Lord RUSSELL, Lord PALMERSTON reminded him that, with colleagues of great ability and high political rank, it was no longer possible for one or two leaders to determine the course of the Government; "as you and I might have "done" in such a Cabinet as that which was ruled by PITT. In the present Ministry there are several members of high Parliamentary position, but they are collectively powerless if they resist the impulse given by Mr. GLADSTONE. He alone, like ZEUS in the Iliad, is stronger than all of them put together, not only and not mainly through superiority of ability and wisdom, but because he has the multitude at his back. The constituencies are now the masters of the House of Commons, and through Mr. CHAMBERLAIN and other managers of the Radical organization Mr. GLADSTONE can bring the opinion of the Liberal Associations to bear against resistance or hesitation. The Three Hundreds and Five Hundreds who were originally charged with the manipulation of elections have already assumed the character of permanent committees, which remonstrate with their members as often as they display any decided independence.

It is impossible to believe that the Whig members of the Cabinet approve of the characteristic measures which are loudly applauded by the extreme faction. The ablest journalist of the party of movement lately boasted, with perfect justice, that the first Session of the present Parliament promised to be the commencement of an epoch of organic change. None of the Bills which have been debated are of the first importance; but the legislation of the Government is directed to interference with the rights of property. Having endeavoured to reassure himself by the names of Ministers of high social rank and of acknowledged moderation, the writer in the *Edinburgh Review* cannot help objecting in detail to nearly all the acts and measures which the Whigs are powerless to prevent. He is naturally indignant at Mr. CHAMBERLAIN'S reply to "a deputation of foolish tradesmen who "came to protest against the liberty of trading in Co-"operative Stores." A measure introduced by the Whig President of the Local Government Board to remit penalties incurred by refusal to vaccinate children "is "still more indefensible. It is a criminal surrender of a "public duty to a most mischievous agitation." In this case it may be confidently assumed that Mr. DODSON, who has since been temporarily excluded from Parliament, was the mouthpiece of Mr. GLADSTONE. In one of the numerous postcards which conceded the abolition of as many institutions of the country, Mr. GLADSTONE had intimated his belief that penalties on the diffusion of a dangerous disease were unjustifiable infringements of freedom. The Whig apologist further notices the fact that "Ministers "have found themselves voting in the minority on several "occasions, such as Sir WILFRID LAWSON'S and Mr. PEASE'S "resolutions on the sale of liquors, and the first resolution "to exclude Mr. BRADLAUGH from taking the oath." No mention is made of the Hares and Rabbits Bill, which was not only vicious in principle, but profoundly distasteful to

all landowners and to all sportsmen, including probably a majority of the Ministers. The deliberate affronts which were offered to country gentlemen in the opening speech of the mover have since been applauded by an able partisan on the ground that the only chance of passing such a Bill is to frighten its opponents.

Finally the Reviewer concurs with every member of the political connexion to which he belongs in condemning the Irish Disturbance Bill, which will nevertheless be forced through the Commons by the Cabinet which contains so many ornamental names. "The welfare of the people, now "and hereafter, and not the clamour and exigencies of "party, must be the rule and object of a wise Government, "and they can never be departed from with impunity. "The resignation of the Marquess of LANSDOWNE, one of "the ablest and most consistent representatives of Whig "principles by character and by descent, is a striking "confirmation of these remarks, and it occurs at the mo-"ment when we close these pages." If the publication had been delayed to the end of the Session, the writer's just remarks might perhaps have received additional confirmation. The previous remark that the Liberal party has been reconstructed on a Whig basis receives no confirmation in any comment on the measures of the Government. As to foreign policy, the writer truly says that the critical state of affairs at Constantinople "is fraught with danger and difficulty, not only to "Turkey, but to Europe." For those complications the Government is only responsible if it has made a categorical demand of the Porte, without concerting effective measures to ensure submission; but the risk of war is alarming, though it may not have been created by Mr. GLADSTONE and Lord GRANVILLE. For the crude and dangerous character of domestic legislation the Government is exclusively responsible; but those who are unable to share the professed complacency of the *Edinburgh Review* have at present no remedy to suggest. Wise action on the part of the Opposition would be the best palliative; but of late the conduct of debate has been usurped by young adventurers who are only anxious to distinguish themselves and to annoy their adversaries at the risk of entitling the victims of obstruction to sympathy. The cautious and provident policy by which Sir ROBERT PEEL built up the Conservative party after the Reform Bill has no competent imitator in the present day. It is possible that after a time Sir STAFFORD NORTHCOTE may succeed in restoring discipline, and in preparing the party to profit by its identity of opinion with the Whigs, including perhaps half the Cabinet.

AFGHANISTAN.

IT is seldom that a Minister has made an answer to a question which is likely to meet with such general approval as Lord HARTINGTON'S answer to Mr. ONSLOW on Thursday night. "The position of Afghanistan," said the INDIAN SECRETARY, "is somewhat critical." It is so critical, apparently, that the Indian authorities objected to anything being said about it until the result of a durbar held that day was also made known. The mystery attaching to this reply is somewhat removed by the contents of a *Daily News* telegram, published on the morning of the day on which Lord HARTINGTON'S answer was given. At this momentous durbar, it seems, if this telegram is to be trusted, nothing less than the adoption of ABDUL RAHMAN as the English candidate for the throne of Afghanistan was to be announced, and the natives of that sorely divided country were to be informed that thenceforward Great Britain washed her hands of Afghan State affairs. Even this information leaves a great deal to be desired as to the policy adopted, or to be adopted, in reference to the turbulent regions west of the scientific frontier or its substitute. It will be remembered that about six weeks ago a question was addressed to Lord HARTINGTON on the subject—a question which was answered with commendable caution and reticence. Lord HARTINGTON himself was always a judicious and reasonable questioner in the last Parliament, and he might plead that, his own withers being unwrung, the galls of his colleagues in the Cabinet did not particularly concern him. Certainly the answer to which we have referred was one which would have been loudly grumbled at by the advocates of an impossible freedom of speech on the part of Governments. But, cautious as it was, it allowed a glimpse to be obtained of at least two important principles which were to govern the Afghan policy of the new Government, and which were enough to distinguish this policy from that of the last Government. Lord HARTINGTON hinted pretty plainly that the first desire of himself and his colleagues was to get out of Afghanistan. He safeguarded this somewhat dangerous statement by the addition that they considered it a *sine quâ non* of departure that something like a stable Administration should be left behind. It is in the light of this statement that we must read the remarkable news which has been recently received, and it must be admitted that the reading is beset with not a few difficulties. The statement that from Thursday last forward we have nothing to do with State affairs in Afghanistan would be welcome if it could be implicitly relied upon.

The actual circumstances of the case are as follows. Three sons and one grandson of the late SHERE ALI are, or have been, candidates for the Ameership of the geographical expression Afghanistan. A namesake of that ill-fated Prince, but a member of a different and hostile clan, is actually, and by English recognition, ruler of Candahar, not the least important element in this expression. These five persons are YAKOOB KHAN, ex-Ameer and compulsory guest of England; AYOUB KHAN, ruler of Herat, puppet in the hands of certain revolted military chiefs, and at present, as far as is known, invader of Candahar; ABDUL RAHMAN KHAN, lately a guest of Russia, and seised actually, if not formally, of Afghan, Turkestan, and Kohistan; MUSA KHAN, son of YAKOOB, and cloak to the ambitious movements of the fanatic MUSHK-I-ALUM and the *condottiere* MAHOMED JAN; and, lastly, SHERE ALI, the ruling Wali of Candahar. SHERE ALI'S troops, on the march against AYOUB, have just mutinied against him, and it is by no means certain that his authority can stand without English bayonets. AYOUB, as already mentioned, is little more than a puppet representing the unknown quantity Herat, and is on the verge of actual collision with our troops. YAKOOB is at present out of the running; and the chief partisans of MUSA have nominally submitted, or are on the point of nominally submitting, to ABDUL RAHMAN. Meanwhile our own position is both anomalous and unpleasant. We are perpetually teaching lessons to casual gatherings of Afghan tribesmen, with some loss to ourselves, with immense loss to the enemy, and, it may be without too much audacity conjectured, with no very marked increase of the vanishing quantity of Afghan affection towards ourselves. The expense of the war is enormous, especially since the officers who conduct the non-military operations have adopted the principle of subsidizing enemies in order that they may become friends, and of subsidizing friends in order that they may not become enemies. The Government won their way to power by condemning the Afghan war, and they have, since they were securely seated in Downing Street, asserted their intention to cut themselves loose from the whole affair as soon as they possibly can. Of positive assurances there is nothing to bind them except the two principles which we have already extracted from Lord HARTINGTON'S former answer, and therefore they can most fairly be judged by confining the attention to these two principles. We shall assume that the retention of power by the new Wali of CANDAHAR, whose position guarantees us the possession of what has been called rightly or wrongly the glacis of India, is an integral part of their policy, and that ABDUL RAHMAN has accepted this. We shall suppose for the moment that they believe the submission of the fanatic MUSHK-I-ALUM, of the warlike MAHOMED JAN, and of the formidable Ghilzai chief AZMATULLAH to be authentic and genuine. The question then remains whether the immediate acceptance of ABDUL RAHMAN is wise or not.

To some uncompromising persons this question would be settled offhand in the negative by the reflection that ABDUL RAHMAN is a *protégé* of Russia. This, however, would be to take altogether too summary a view of the matter. Fortunately we do not possess a monopoly of Afghan ingratitude; and it is quite possible that ABDUL RAHMAN may disappoint his dubious benefactors. But this is the least part of the matter. The real point of importance, and the point which, in the present temper of too large a part of the nation,

is likely to receive very little attention, is whether the conditions precedent of the recognition are or are not likely to be fulfilled. Are we likely by this offhand acknowledgment of ABDUL RAHMAN to get out of the country speedily and cheaply? Are we likely by the same expedient to secure the authority and the friendship of this hitherto rather dubiously famed Pretender? The Government have not yet given satisfactory answers to those all-important questions, and it is even doubtful whether it is in their power to give such answers. It is as impossible at the present moment for any single person to answer for the disposition, much more for the fidelity, of the clans of Afghanistan as it was a century and a half ago for any single person to answer for the fidelity of the clans of Northern Scotland. Lord HARTINGTON, on the occasion more than once referred to, alluded to the dangerous rapidity with which utterances in the English Parliament reached Central Asia. Who shall say that the chiefs of the late Afghan national movement have not heard of Lord HARTINGTON'S own declaration, and have not decided that a nominal submission to ABDUL RAHMAN is the readiest way of getting rid of the inconvenient and hated presence of the English in the Cantonments of Sherpur? Who, again, can guarantee the quiescence of Afghanistan, even supposing—a large supposition—that the warlike tribes of the centre choose to coalesce, so long as the Herat district is in open revolt, and Candahar is held in a dubious and disputed position of vassalage as regards ourselves? No doubt a partial withdrawal might, under the conditions indicated in the latest despatches, be effected with comparative safety. So long as a considerable force is ready to work up from the south on the basis of Candahar or even Quettah, so long as the all-important route whereby General ROBERTS penetrated to Cabul is under our control and strongly garrisoned, no disturbance in Afghanistan can be of more than temporary importance. But does the maintenance of these two conditions enter into Lord HARTINGTON'S plan? It must be acknowledged that it was not obvious on the face of his first statement, and that it seems inconsistent with the haste evinced in this handing over of Afghanistan to the first comer. It is true that ABDUL RAHMAN is much the most likely of the various pretenders. But, unless a great deal has been kept back—and, considering the too well-known faithlessness of the Afghan character, even if a great deal has been kept back—there is as yet no sure reason for concluding that he is the elect of the people. Any one who is not the elect of the people, as we know from bitter experience, is likely to have an exceedingly unquiet time of it. Now the one thing which we do not want on our North-West frontier is the proverbial house smoking through the slates. The fact that the Afghan war interfered with the first Government which for many a long day had secured the unity of Afghanistan, was the strongest argument against the policy of the late Ministry, just as the fear of Afghan restlessness was the strongest argument in favour of it. At present, it has not been shown that the agreement, or supposed agreement, of the Afghan tribes in the sovereignty of ABDUL RAHMAN is complete; it has not been shown that it is genuine, it has not been shown that it is likely to be lasting. By the adoption of a very cautious policy of retreat on the chief lines of our occupation, and, above all, by the maintenance of a strong force ready to act by way of Candahar and of the Peiwar, the dangers of this premature recognition, should it be followed by an equally premature retirement, might be reduced to a minimum. Otherwise, it is but too likely that, after spending many millions of money and many hundreds of valuable lives for the attainment of a given end, we shall at no distant period have to meet an unknown supplementary expenditure in both kinds to regain what we seem now, in one of the fits of hasty disgust characteristic of England, about to recklessly abandon.

THE CUSTOMS AND REVENUE BILL.

AS Mr. GLADSTONE himself necessarily takes exclusive charge of the Bill giving effect to his financial proposals, the debates that this Bill provokes have one kind of superiority which raises them above the usual Parliamentary level. Every speaker knows that he is speaking to Mr. GLADSTONE; that is, to the statesman who, since the death of Sir ROBERT PEEL, has been recognized as the greatest master of English finance. No one, therefore, likes to speak without being prepared to show that he has thoroughly got up some point to which he wishes to draw the attention of Mr. GLADSTONE and the public. There is no talking for talking's sake. On the other hand, Mr. GLADSTONE is always present to give an answer, to listen to suggestions, to announce authoritatively the intentions of the Ministry. The peculiarity of this state of things was signally illustrated by the turn which a discussion raised by Mr. HUBBARD on the incidence of the Income-tax ultimately took. Mr. HUBBARD did not object to the present increase of the Income-tax, but he wished the House to record its opinion that, for the future, the Income-tax must be assessed on fairer principles. He objected that the tax as now levied falls with undue severity on men whose incomes only exist while they have health and strength, and that the tax on property is levied on its nominal, not on its real, value. For the purposes of local taxation property is taken at its rateable value—that is, an allowance is made for necessary outgoings. For the purposes of the Income-tax, as Mr. HUBBARD states, property is taxed on all that it brings in, and the outgoings are regarded as one mode of spending income. To these objections Mr. GLADSTONE answered that, in many ways, no doubt, the incidence of the Income-tax is inequitable. But he could state that, thirty years ago, he, with a full sense of the inequalities of this incidence, had set to work to plan a more perfect scheme, and had been unable to hit on any project that would do justice to every one. Some years ago there was a Committee appointed to consider the incidence of the Income-tax, on which Mr. HUBBARD himself sat, and before which Mr. MILL, who strongly supported the view that the tax was unfairly levied, gave the most elaborate evidence; and yet this Committee considered the proposals put before it for making the tax more equal utterly impracticable. Mr. GLADSTONE has had many successors in the Exchequer, and none of them have been able to hit on any plan for carrying out what Mr. HUBBARD wishes. Mr. GLADSTONE has had for years an intimate acquaintance with the permanent officials of the Exchequer; and they all unanimously pronounce that, when they wish to contrive a better mode of levying the Income-tax, their minds remain in a state of complete helplessness. The answer to Mr. HUBBARD was, therefore, that he was proposing that the House should solemnly ask Mr. GLADSTONE to do what Mr. GLADSTONE confessed he, with all his ability and experience, could not manage to do; and the authority of Mr. GLADSTONE in finance is so great that, directly the proposal was put in this shape, there was an end to it. Such are the advantages or disadvantages of possessing a financial dictator. *Non possumus* has not been admitted as a final answer to the demand for reform in general politics; in finance it seems to be regarded with greater favour.

Much the same may be said of a question raised by Mr. HUBBARD'S seconder, Captain AYLMER, and debated by several successive speakers. This question was whether it was either fair or necessary that a penny should be added to the Income-tax this year. As to the theoretical fairness of thus burdening the Income-taxpayers there can be no dispute. A Beer-tax is to be substituted for the Malt-tax, and the change is supposed to benefit farmers, who will sell inferior barley at better prices, beer-drinkers, who are to get beer a little cheaper, and the general public, in so far as the Beer-tax may produce more than the Malt-tax produced. The cost of the change is to be borne by the Income-taxpayers alone. They are victimized in order that their neighbours may be benefited. All Mr. GLADSTONE has to say is that he must have the money, and that he does not see any way of getting it so easy as that of making the Income-taxpayers furnish it. Here again Mr. GLADSTONE'S authority comes in, and a docile Parliament is not unwilling to sacrifice the Income-taxpayers in order that Mr. GLADSTONE may have an opportunity of showing the great things he can do if he is allowed to begin in his own way. It has been suggested, and was again suggested on Tuesday, that Mr. GLADSTONE might do without the money, encounter a deficit, and make good this deficit in future years. That is, he might have managed as Sir STAFFORD NORTHCOTE would have managed. But then this would be to substitute Sir STAFFORD NORTHCOTE'S financial method for Mr. GLADSTONE'S. It is not a matter of Liberal or Conservative policy, for Mr. GLADSTONE'S

method is the method of Sir Robert Peel. Sir Stafford Northcote and his school, of which Lord George Hamilton is the most rising disciple, look to the present comfort of the taxpayer. What, they say, is the good of a surplus? The Government ought to make the taxpayer provide exactly what is really needed, and not a penny more. If there is an unexpected call for money, the taxpayer should be allowed to pay it in the way most convenient to him—that is, by instalments. Mr. Gladstone and Sir Robert Peel have lent the weight of their names to the opposite system, which reposes on the doctrine that each year should meet its own charges, and that the Chancellor of the Exchequer ought always to contemplate a surplus, because, if he is wise, he will take into account that he may spend more and receive less than he expects, and so needs a margin to meet this contingency. The nation has trusted Mr. Gladstone with the management of its finances, and therefore naturally his system now prevails. It certainly is not a system which exposes those who uphold it to the charge of hunting after popularity. For it imposes great immediate sacrifices, and impels the taxpayer to scrutinize keenly the action of the Government; and in times of distress it needs much firmness in the Minister who adheres to it and makes Parliament adhere to it. It may be admitted that there is a correlative advantage of which Mr. Gladstone has himself before now reaped the benefit. The remission of taxation is considerably facilitated by the previous imposition of unnecessary taxes, and the taxpayer is apt to forget his indignation at the loss in his gratitude for the gain.

There was a further argument against the proposed addition to the Income-tax of which Lord George Hamilton was the chief exponent. This was, that a means of meeting a deficiency need not be sought, because there would be no deficiency to meet. The Beer-tax, it is urged, will produce so much more than the Malt-tax used to produce, that this increase will meet, or go very far to meet, the cost of the change. Brewers have furnished the necessary statistics to prove this; but then Mr. Gladstone declines to accept the statistics of the brewers. He has made his own calculations and sticks to them. No outsider and no ordinary member of the House of Commons has any means whatever of saying which set of calculations is right. Mr. Gladstone's calculations must be taken because they are Mr. Gladstone's, or not taken at all. The public and the majority of the House of Commons accept them with a childlike faith. They do not know anything about the matter, and abide by the conviction that, as somebody must be right, Mr. Gladstone is more likely to be right than any one else. But even Mr. Gladstone ran a near risk of seeing his authority defied. On Wednesday the brewers tried to get, and nearly succeeded in getting, a change in the Bill referring to an extremely technical point, that of the estimate of the specific gravity of wort. Mr. Gladstone declared that, if the proposed change was adopted, the revenue would lose so greatly that it would actually suffer a diminution by the substitution of the Beer-tax for the Malt-tax. On a division the Government had only a majority of thirty-seven, and Mr. Gladstone subsequently announced that, if he had been defeated, he would have withdrawn the Bill altogether. This would have been rather hard on the Liberal absentees, who could have had no notion that the fate of the chief financial Bill proposed by their leader this Session depended on their attending to uphold a particular figure in calculating the specific gravity of wort. Only 188 understood their duties properly, so that the number of Liberal absentees must have been nearly as great as that of the Liberals present. Nor is it quite credible that Mr. Gladstone could not have found some way of giving these absentees a fresh opportunity of putting this specific gravity at the right figure. But all that Mr. Gladstone meant may have been that he must have his financial scheme adopted as a whole or not at all. This he is quite entitled to say. He has proclaimed that there are great things to be done in the reorganization of English finance. The nation has believed him and has shown its conviction that he alone can do these great things. Much, therefore, must be accepted simply on his authority; and, although he has shown himself willing to make many concessions in detail both to great brewers and also to those who not only brew in cottages, but like the beer they brew, still he insists on getting his way in the main, and probably he will get it.

PARLIAMENT AND WESTMINSTER ABBEY.

The Dean of Westminster need not regret that he has been relieved by the House of Commons from a pledge which he could not honourably have repudiated. It would perhaps have been better that, in commenting on the vote of the House of Commons, he should not have referred to the "persistent misrepresentations and savage "menaces which have hitherto supported the agitation" conducted by demagogues speaking after their fashion. As there were some good reasons for not erecting the monument in Westminster Abbey, the decision may be more conveniently attributed to the House of Commons than to an ignorant mob. It was, at the worst, a pardonable mistake to share and recognize the sympathy which was aroused by the tragic death of Prince Louis Napoleon while he was serving with an English army. It is true that he went to Africa, as two of the Orleans Princes a few years ago joined the Federal army in America, for the questionable purpose of acquiring in the estimation of his countrymen the character of a soldier. It was essential to his object that he should expose himself to risk; and yet the circumstances of his death were extraordinarily unsatisfactory and painful. In the first hurry of a regret which almost partook of the nature of remorse, it seemed as if reparation was due to his memory; and the Dean of Westminster might well be excused for a desire to soothe the feelings of the Prince's family by conceding to him the honour of a monument in the Abbey. It has since been pointed out that the unfortunate young man was scarcely included in any of the categories which raise a claim to posthumous honours conferred in the name of the nation. Though he was the heir of a great historical House, he was not an Englishman; and he had not lived long enough for the opportunity of personal distinction. It might also have been foreseen that the erection of a monument to his memory would give occasion to factious clamour, on the easy assumption that sepulchral commemoration implies political agreement or approval. The agitation has resulted in the establishment of a negative precedent, which may hereafter be found highly convenient. The future exclusion from Westminster Abbey of monuments in honour of foreigners ought to apply to foreign agitators whom it might otherwise be the humour of the populace to honour. Revolutionary exiles can scarcely have a stronger claim to monumental records than the representative of a dethroned dynasty. It may also be well to check the indiscriminate liberality with which the effigies of Englishmen of secondary eminence have been admitted to the Abbey. Great men, and men of doubtful greatness, have become so numerous that some parts of the building look like the yard of a tombstone-maker in the New Road.

The declamations against the young Prince and his family which were delivered at the late meeting, and, as if by adjournment, in the House of Commons, exhausted the capabilities of bad feeling and bad taste. Sir Wilfrid Lawson, who presided at the meeting, enforced his counsels of moderation and propriety by asserting that Louis Napoleon had fallen in an attempt to combine with "English savages" in an unjust war against the Zulus. Notwithstanding many plausible precedents, voluntary participation in a war between foreigners is morally indefensible; but the principals in the quarrel may be discharging an indispensable duty. Sir Wilfrid Lawson's savages were acting under orders which they were bound to obey; nor had they either the right or the power to inquire into the justice of the cause for which they were fighting. It unluckily happens that popular philanthropists can never suppress or conceal the animosity by which they appear to be habitually actuated. Sir Wilfrid Lawson, who perhaps intended only to express his dislike of the Bonaparte family and of absolute power, no sooner crossed the Zulu track than he was at once tempted to diverge into the indulgence of a bitterer antipathy. There was a keener pleasure in vituperating English officers as savages than in visiting on the memory of the Prince the alleged sins of his father. Mr. Peter

TAYLOR, as might be expected, was more extravagantly violent; but he only shared with all the speakers who have joined in the agitation the delusion that a compliment to a member of the BONAPARTE family must be an affront to the present Government of France. NAPOLEON III. never thought himself entitled to resent the close intimacy which the QUEEN and the Royal Family maintained with the ORLEANS Princes after the establishment of the Empire. Two rival dynastics and two Republics have regarded with indifference or complacency the hospitality which Austria has for fifty years accorded to the Count of CHAMBORD. English democrats are more Republican and more French than the French Republic itself. A more intelligent delicacy would suggest to them a doubt whether abuse of a fallen foreign sovereign is complimentary to his former subjects.

Mr. BRIGGS, who digressed from abuse of NAPOLEON III. into eulogy of OLIVER CROMWELL, was happily matched with his Irish critic, who desired to know whether he would erect a monument to "the butcher of Wexford." The House of Commons would perhaps be somewhat less irrelevantly employed in a discussion of CROMWELL's Irish campaign than in an impertinent denunciation of the late French EMPEROR as a conspirator against the liberties of his countrymen. Englishmen of middle age well remember the mob popularity of the EMPEROR during his visits to England and the characteristically absurd sycophancy by which the initials of NAPOLEON and EUGÉNIE were commonly associated with those of the QUEEN and the PRINCE CONSORT. It is not altogether dignified to pass from exaggerated adulation of prosperity to contumelious triumph over defeat. The French are still more completely estopped from accepting as complimentary to themselves such ill-timed tirades as those of Mr. PETER TAYLOR and Mr. BRIGGS. They condoned by overwhelming majorities the successful conspiracy of 1851; and soon afterwards they welcomed with approximate unanimity the restoration of the Empire. The awkward flatterers who assure them that they submitted tamely for nearly twenty years to a degrading despotism exercised by a vulgar criminal are the most offensive of unconscious libellers. It is true that French Republican orators use similar language for the purpose of reproaching their moderate or conservative countrymen; but nations, like private persons, assume a license of self-reproach which is consistent with resentment against foreigners who echo the same accusations. The fact is that the French approved of the Empire as long as it lasted, though their sentiments were naturally modified by the wild adventure of the German war, by the disaster of Sedan, and by the capitulation of Paris. On the eve of the war, in the spring of 1870, a great majority of the whole population voted for the maintenance of the Empire, against a comparatively insignificant section, which included all the Legitimists, all the Orleanists, and all the Republicans. Flattery addressed to the dominant opinion in 1880 becomes an insult to the France of ten years ago.

Among several unsatisfactory peculiarities of the debate were the disposition of the House of Commons to meddle with administrative questions, and its readiness to yield to popular impulse. Mr. BROADHURST, who may well be excused for laying excessive stress on the judgment and feelings of the class which he specially and creditably represents, stated his belief that the workmen in general highly disapproved of the proposed monument. Workmen are not the best judges on questions of foreign policy and international comity. Mr. BROADHURST's reference to the opinions of Parisian workmen was perhaps more relevant to the question, though there can be no doubt that French artisans are profoundly ignorant of all the circumstances of the case. That English workmen should interfere with a trivial administrative detail is a proof of the extent to which they are influenced by political Clubs. There can be no harm in avoiding the erection of an undeserved monument; but, if the country is to be governed by the vague impressions of the multitude, the value of representative institutions is already seriously impaired. Even when the verdict is just, the issue has been submitted to the wrong tribunal, and probably it has also been decided on erroneous grounds. It is highly probable that if the proposed monument had been designed to commemorate an alien Republican such as MAZZINI or GARIBALDI, the popular clamour would have been directed against the opponents of the scheme. Nearly all the speeches at the meeting and in the House of Commons related to political opinions, though the resolution which was carried properly expressed the true objection to the celebration of the memory of a foreigner. Optimists may find some consolation in the recognition, even for mistaken reasons, of the historical and national character of Westminster Abbey. The Clubs of workmen, and the exponents of their opinions in the House of Commons, intended only to express dislike of crowned heads; but incidentally they acknowledged the importance of historical tradition. They admitted by anticipation the appropriateness of the home which has now been found for the monument.

FOREIGN CATTLE AND THE MEAT SUPPLY.

IT was to be expected that the consumers of meat, especially in the Northern towns, would have their hopes raised by the recent change of Government. They had been taught, or had taught themselves, that the restrictions on the importation of cattle imposed by the Privy Council under the directions of the last Parliament were a principal cause of the high price of meat; and they probably imagined that the business of a Liberal Government would be at once to break down the barrier, and let in the foreign herds which would, if admitted, make meat as cheap in these days when wages are comparatively high, and there is money to pay for it, as it used to be when, from the lowness of wages, it was not to be had, however cheap it might be. The deputation that waited on Lord SPENCER on Monday was consequently numerous and important. More than thirty large towns in Yorkshire and Lancashire were represented, and the show of members of Parliament contained the cream of the Liberal Left. They pleaded that foreign meat was good to eat, cheap to buy, and only kept out of the English markets by the law making slaughter at the port of landing compulsory in all cases where the country from which the cattle are consigned is not warranted free from disease. They further contended that the supply of home-raised cattle is decreasing, and that, unless the deficiency is made up by larger importations, the supply of meat will be actually smaller than heretofore. It follows from this, they argued, that the restrictions have failed to effect their purpose. The theory on which they are founded is that, provided diseased foreign cattle can be kept out of the country, the production of healthy cattle at home will steadily become larger. Diseased foreign cattle have been kept out, but there has not been the anticipated increase in home production. The inference is that the policy of restriction is an injury to the consumer without even doing good to the home producer. Foreign meat is excluded from England in order that an abundance of home-grown meat may be raised; but the expected abundance of home-grown meat is not forthcoming.

Lord SPENCER's answer was highly satisfactory, if not to the deputation, at all events to those persons who do not wish to see the administration of the law relaxed at the pleasure of particular officials. The deputation seemed to consider that the decision whether the Cattle Diseases Act should be enforced rested with the Lord President of the Council. That an Act of Parliament was meant to be enforced whether the Lord President of the Council agreed with it or not does not seem to have occurred to them. The law has made certain regulations regarding the importation of cattle, and it has authorized the Privy Council to apply or relax these regulations according as the presence or absence of cattle disease in the countries from which the imports come shall require strictness or justify lenity. The spokesmen of the deputation argued as though the authority of the Privy Council in the matter were absolute; and they possibly hoped that a Liberal Lord President would use this authority to make short work of all the restrictions upon importation which a reactionary Parliament had imposed. Lord SPENCER soon undeceived them on this point. He explained that the power of the Privy Council in the matter was limited to a particular step—the relaxation of the restrictions on importation when they were satisfied that the cattle imported were clean. The opinion of the deputation possibly was that this order of ideas should be reversed, and that the Privy Council ought to be satisfied that the cattle imported were clean as soon as they were of opinion that the restrictions on importation were inexpedient. The country to which the controversy has most reference at present is the United States. Soon after the Act was passed it was found that

diseased cattle were imported from the United States, and the restrictions had accordingly to be put in force. The law against the spread of disease is applied in the United States with all that laxity which the deputation would like to see introduced into England. Some of the States are willing to do all they can to keep their herds clean; but it is very doubtful whether one State has a constitutional right to stop importation from another. The consequence is that all American cattle lie under a common discredit, and importation has to be forbidden as well where the State does its best to keep out disease as where the State takes no trouble in the matter. There is no certainty that cattle coming from any part of the United States will be free from disease; and, where the disease is pleuro-pneumonia, there is no certainty that cattle infected with it when they are put on board in America will be known to have it by the time that they are landed in England. Pleuro-pneumonia may lie hid in the system for two months without its presence being detected, so that an infected beast might be imported from the United States, might be passed into the interior of England, and might have communicated the disease to a whole county before the fact was discovered. Under these circumstances, to admit American cattle would be tantamount to an entire abandonment of the policy of restriction. It was a modest request to make to a Lord President, and one that shows how lightly the restraints of law can sit upon Radical temperaments.

Although, however, the conclusions of the deputation were more than questionable, the figures on which they are based seem unfortunately to be beyond dispute. The supply of home-grown cattle has decreased, and the increase in the imports, though it is decided and progressive, does not as yet keep pace with the growth of the deficit. The cause of the decreased supply of home-grown cattle is not, however, to be looked for in any failure of the restrictions to keep disease at a distance. Cattle die from want of food as well as from disease, and when a farmer can give his beasts nothing to eat, he has no choice but to sell them to the butcher instead of keeping them for breeding. To do this, as Lord SPENCER said, is to live upon capital; but during the recent bad seasons capital has been all that many farmers have had to live upon. At the same time the diminished production of English cattle, to whatever cause it is to be attributed, tends to make the maintenance of restrictions on importation additionally difficult. Lord SPENCER is naturally determined not to make the Cattle Diseases Act an instrument of protection to the farmer, and he says that the Duke of RICHMOND and GORDON was quite as determined as himself that it should not be put to any such use. When the Governments of both parties are resolved to treat the Act simply as an expedient for increasing and improving the supply of meat in the country, it is plain that if, notwithstanding the Act, the supply goes on decreasing, the policy which prompted it will have to be reconsidered. As we have often pointed out, the interest of the consumer requires that the larger source of supply should not be sacrificed to the smaller. So long as nearly the whole of the meat eaten in England is raised at home, it is of paramount importance to protect that meat against disease, and if the main source of disease is the importation of foreign cattle, the importation of foreign cattle must be forbidden. In proportion, however, as the meat eaten in England ceases to be raised at home and is imported from abroad, the argument for restricting importation grows weaker. It is conceivable that a point might be reached at which unrestricted importation would increase the meat supply, even though it brought disease with it, and that it would be better for the consumer to go without the home supply altogether than to put up with a diminution in the foreign supply. Long before that time, however, the raising of meat in England, except to give amusement to wealthy breeders or an exceptional pleasure to palates whose owners can afford not to care about the amount of their butcher's book, would have come to an end. A few years will probably show whether the English farmer must give up raising cattle, as he is already being forced to give up growing wheat. For the present the interest of the consumer and that of the English producer remain identical. The momentary cheapness of meat which might follow upon unrestricted importation would be followed in its turn by a rapid spread of disease. The increased importation would then still more than now fail to fill up the vacuum, and something like a meat famine might set in. The theory that, if all restrictions were removed, the imports of cattle would at once keep pace with the demand, leaves out of sight the necessary delay in cattle production. As Mr. JAMES HOWARD remarked, in his evidence before the Select Committee in 1877, "the agency of mothers is in-"dispensable in bringing animals into the world," and it may be inferred from his letter in the *Times* of Thursday that the advance of science during the past three years has made no change in this respect. In default of spontaneous generation, cattle-breeding even in America must be a slow process; and, until the American supply is immeasurably greater than it is, we cannot afford to do without the English farmer. Until we can afford to do without him, it will be prudent not to let him disappear; and if to his other troubles should again be added an outbreak of contagious disease among his cattle, he might disappear almost without our knowing it. While he is still with us, the deputation which waited on Lord SPENCER may find an ample field for exertion in the improvement of the arrangements by which American meat is distributed to private consumers.

EGYPT.

THE decisions of the Commission of Liquidation have now been formally adopted by the KHEDIVE and promulgated in the shape of a law. The Treaty Powers have given their consent, and this law is therefore now binding on the International Tribunals. Its provisions absolutely determine every claim on the Egyptian Government prior to the beginning of the present year, so that Egypt is now free from the inextricable confusion of the past, and has only to avoid embarrassment for the future. The basis of the whole scheme has been the calculation of the normal revenue of Egypt, the deduction of an amount from the total sufficient to cover the current expenses of administration, and the application of the residue to the payment of interest on the various debts of the State. It is impossible from the telegraphic summary of the decisions of the Commission to estimate accurately the figure at which the normal revenue has been calculated; but it will probably be found that it does not exceed eight and a quarter millions sterling. The sum devoted to the administration falls slightly below five millions sterling, and thus an amount somewhat exceeding three millions will be applicable to the payment of interest. When there is a surplus beyond what is taken as the normal revenue, an effort will be made to reduce the principal of the main debt; but it is the punctual payment of interest with which creditors chiefly concern themselves. Will then this interest be paid? There can be no doubt that, with decent government, Egypt can easily afford to pay it, and that very satisfactory progress has already been made in beginning that reign of good government which will enable Egypt to bear with tolerable ease the burden which is henceforth to be cast on her. A Parliamentary paper has recently been published containing the reports of English consular agents, brought down to a late date, as to the present state of things in rural Egypt. It discloses facts most reassuring to the friends and to the creditors of the country and most honourable to the new Government. Throughout the land the taxes are collected without coercion. The whip is no longer the arm of the tax-gatherer, and the prophecies with which Egyptian society has so long rung, that the fellahs would never pay unless they were well beaten, have been completely falsified. Notices are served on the peasants informing them beforehand how much they are to pay and at what times; and they not only pay cheerfully and readily what is due when it becomes due, but they are learning to look ahead and to see how they mean to provide for instalments which will not become due for some time to come. They are no longer compelled to borrow; for the main reason of their borrowing was that in the old days they never knew what demands would be made or when, and they were liable to be suddenly called on for sums which they had no possible means of meeting without having recourse to the usurer. They are able now to calculate on a respectable surplus for themselves after they have paid their taxes, and, as an immediate consequence of this change, the price of land has largely increased, being in some cases double what it was a few months ago. No news could be more comforting to the creditors than

this. Land rises in value because, after the taxes have been paid which will suffice to meet the claims of the creditors, much will be left to the cultivators, and there is thus an indisputable proof that Egypt can pay what she has now agreed to pay.

In planning a settlement, the first care of the Commissioners was to secure a sum in hand which would place Egypt in possession of ready money. There was the balance of the ROTHSCHILD loan, and the sum thus available has been increased by the creation of 5¾ millions of Preference Stock to rank with and form part of the existing Preference Stock. The holders of the Floating Debt will receive 30 per cent. in cash and 70 per cent. in Preference Stock at par. No reduction is to be made in the capital of this debt, and, if the telegraphic summary is to be trusted, the interest up to the middle of last April is to be capitalized at the legal rate, which is 12 per cent. All that can be said is that this is an admirably good arrangement for the holders of the Floating Debt, as is also another provision of the law, by which the mortgages on the domains having priority to the inscription of the ROTHSCHILD loan are to be paid off in cash. In this favoured category are also to be placed the arrears of salaries and pensions, the arrears of the Tribute, and the sums due to a certain orphan fund which that father of his people, ISMAIL PASHA, devoted to his own use. A sum somewhat exceeding half a million is to be applied in settlement of claims made by or through members of the Khedivial family. Another sum almost of the same amount is to be handed over to the Daira Sanieh to furnish it with a working capital and to provide for the payment of the next coupon, which has been endangered by the apprehended failure of the sugar crop, owing to the unusually severe frosts of last winter. Lastly, 650,000*l.* is to be borrowed on land belonging to the Government in order to meet claims pending before the International Tribunals. Various compromises already made with some principal creditors have been sanctioned, and thus the general result is that means have been found to deal not only fairly, but liberally, with all who have *bonâ fide* outstanding claims. It must be owned that some of these claimants have come better off than they were entitled to expect if strict justice had been done all round. Those who poured their money into the lap of ISMAIL PASHA in the last days of his extravagance get more than those who gave him their money some years ago. But the Commissioners have had to think of other things besides strict justice. The later creditors were in a better position before the International Tribunals, as they could get judgments for distinct sums owing to them as individuals, and the Treaty Powers—and especially Austria—considered that it was above all else important to uphold the decisions of the Tribunals. These creditors, too, had a much more ready means of using diplomatic influence than the ordinary bondholder could command. They could come with their own personal wrongs and sufferings to their respective consuls, and ask individually for intervention and redress. They have clamoured loudly and asked boldly and persistently, and the result has shown that their clamouring and their asking have not been in vain.

The first task, then, of the Commission was to fix a yearly sum to be applied for the benefit of the creditors, which Egypt could in a normal year easily supply. The second was to get enough cash to settle outstanding claims. The third was to place on a final footing the different heads of Egyptian debt. The Preference Debt has been increased by about a third of its amount. Against this is to be set a sum of 70,000*l.* a year from the harbour of Alexandria, released by a settlement of the claims of the contractors. Further, the holders of this debt are entitled to look for a very considerable increase in the proceeds of the railways, which constitute their special security. An offer was made a few months ago by persons of very high standing to lease these railways on terms which would have guaranteed the payment of the Preference interest as it then stood, whereas up to this time the revenues of the railway had not nearly sufficed to cover this interest. The Egyptian Government refused the offer on the ground that it could not with due respect to itself place its railway system in the hands of foreigners. It may have been right in making this decision; but, at any rate, it now knows that the railways, if decently managed, would yield much more than they do, and it must justify its exclusion of foreigners by showing its own ability to make improvements in railway administration. The Unified Debt, which is the main debt of Egypt, is the least favoured of any. It is to carry interest at 4 per cent. instead of 7, at which it was originally borrowed. It is to be increased by an amount of two millions, representing the conversion into this stock of the short loans—that is, of the loans which would have been soon paid off if the Moukabaleh had been applied to their extinction. The arrears of the coupons of the Unified Debt are to be simply wiped out. On the other hand, the special securities assigned in 1876 to guarantee the payment of the interest of the Unified Debt are continued for the benefit of this class of bondholders. But their best security is one that no Egyptian law could possibly state. They are specially protected by French influence; and the French Government, unless it entirely alters its present views, will never recognize any Egyptian Government as a good or even tolerable Government which does not somehow manage to pay the interest on the Unified Debt. France and England may before long agree to diminish or terminate their peculiar kind of intervention in Egypt; but the Egyptian Government will always feel that, unless the interest on the Unified Debt is paid, intervention will begin again, as if France intervenes England will always be obliged to keep her company. The claims of those who have paid the Moukabalah are to be met by a sum of 150,000*l.* a year being set aside for fifty years for their benefit, and it is stated that this sum, as well as the tribute to the Porte, and the interest due to England on the Suez shares, is to be included in the sum assigned for the ordinary administration. One account says that the interest of the small Daira Khassa loan is also to be met from this source, while another account represents the Khassa loan as merged in the Daira Sanieh loan. It seems to have been supposed in some quarters that it was a great advantage to bondholders of a particular class to have a provision for their interest made out of the sum set aside for the Administration. Experience shows this to be a mistake. It is the Egyptian Government which collects the taxes out of which the Administration is to get its money, and if it does not get as much as it desires, it will be sure to help itself first, and its creditors, who are looking to this Administration fund, last. Lastly, the Daira Sanieh, besides having a good sum in ready money to meet bills, is to retain its special securities, is to pay 5 per cent. if it can, is to have 4 per cent. guaranteed by the Government, and, if the Government does not fulfil this guarantee, is to be allowed to retain out of its taxes enough to make up what the Government ought to have supplied. These are very favourable terms, and the Daira Sanieh creditors seem to be among those who have most reason to rejoice in the arrangements of the new law.

EMPLOYERS' LIABILITY AND INSURANCE.

THE Government would not have improved the prospects of the Employers' Liability Bill if they had adhered to their intention of mixing up the two questions of compensation and insurance. Both ideas are good in their proper places, but they are not ideas which admit of being substituted for one another. How incongruous they really are will be seen by supposing them applied to the relation of railway Company and railway passenger. If it were proposed to relieve railway Companies of the unpleasant liability to make compensation to killed or wounded passengers to which they are now subject, provided that they had contributed a fixed proportion of the premiums payable to a railway insurance Company, the public would certainly object that what they want is security, and that compensation gives security, while insurance does not. As it seems to us, the public would be quite right in thus reasoning. Compensation makes the cost of an accident fall on the man who is determined to be responsible for it. Insurance takes the cost of an accident off the man who is responsible for it, and distributes it over the contributors to the insurance fund. Why is Lord CAMPBELL'S Act, on the whole, popular? Because the travelling public feel that it supplies a guarantee which they could not obtain in any other way that the railway Companies will be careful to carry them safely. The railway Companies might contribute to the railway insurance Companies; they might even present each passenger with an insurance ticket, without in the least

creating this sense of security. An accident more or less would not matter to a railway Company if the funds of the insurance Companies were the only source to which an injured passenger could look to make good his loss and suffering. The knowledge that if they are careless they may have to pay heavily is the only means of insuring caution that has yet been devised, and, faulty as it may be, it has certain obvious merits which do not belong to the insurance plan.

These considerations are equally applicable to the proposal to make provision for insurance a part of an Employers' Liability Bill. The argument is forcibly and succinctly stated in a memorial from the executive of the Miners' National Union. Insurance, the memorial says, is not properly directed against negligence. It is meant to guard against accidents which are really accidents, and cannot therefore be guarded against in any other way. Negligence ought to be met by a provision which makes it the interest of employers to avoid accidents, and the only provision which answers to this description is one which compels them to make compensation to the sufferers if avoidable accidents occur. The workman does not want a money payment after an accident has maimed or killed him; he wants to have accidents which may maim or kill him properly guarded against. So far as the general principle goes, this is a perfectly sound distinction. Even the employers who are opposing the Employers' Liability Bill do not deny it in words; they only say that avoidable accidents are very rare, that all possible care is already taken to prevent them, and that an Employers' Liability Act can only lead to litigation directed to prove that an unavoidable accident might have been avoided. This plea makes employers a little too like angels. In theory, no doubt, they take all possible precautions against accident; but it may be doubted whether with many of them the wish does not stand for the deed. They may be as much shocked, no doubt, as any one else when an accident happens in a mine of their own; and yet be very much given to assume that it happened, not for want of precaution, but in spite of it. Undoubtedly, if it were proposed to make employers liable for the negligence of men over whose engagement they have practically no control, and of whose qualifications they can have no knowledge, all that is said against the Employers' Liability Bill would be well deserved. As it is, most of the arguments against it seem to take no note of the fact that an employer may show negligence in the choice of a subordinate as well as in any immediate act of his own. It is not too much to ask of a large employer of labour to exercise as much care in the selection of an agent who will hold the lives of many men in his hands as he would exercise over his own conduct if he knew that he himself held the lives of many men in his hands. To make him do this is the object of the Employers' Liability Bill, and nothing that has yet been said on the other side has convinced us that in passing such a Bill the Legislature is going at all beyond its proper province. Of course it should be strictly limited to cases in which the negligence of an agent is indisputably the cause of the accident, and it may not be easy to devise words which shall unmistakably express this limitation. But this, after all, is rather a question for the draughtsman than for the Legislature. It is his business to express clearly what the Government mean their measure to do, and if in its present form the Bill fails to do this, it should be amended in Committee. The sincerity of some of the objections taken to the details of the Bill is made a little doubtful by their being used as an argument why the Bill should be altogether withdrawn.

At the same time, the importance of a good system of insurance in hazardous trades can hardly be exaggerated. Mr. Pease has drawn in the *Times* a striking picture of the different position of the families who have lost husbands, or sons, or brothers in the Risca explosion, and the position in which they would have been if the explosion had taken place in the coal-field of Northumberland and Durham. In South Wales they have nothing to look to except the Poor-law or private charity. In Northumberland and Durham the men who were killed would have belonged, almost as a matter of course, to the local Miners' Provident Society, and in that case their widows, children, and relations generally would have been entitled to considerable payments out of the insurance fund. A widow would have received 5*l*. down and 13*l*. a year for an average of ten years. Each child would be paid 2*s*. a week in addition, so that, supposing a widow to have two children, she would receive 9*s*. a week in addition to her own earnings. The representatives of each single man killed would receive 12*l*. in one sum if the sufferer were under eighteen, and 23*l*. if above eighteen. These benefits, together with an allowance in case of permanent disablement, may be secured by a payment of 7*d*. a month. Whether this sum is adequate to the demands of one or two accidents of the scale in which colliery accidents now for the most part are cast is hard to say; but the miners are usually able to pay, if necessary, a larger premium than this. We cannot see, however, that insurance against accidents to workmen, excellent as it is in itself, is so obviously a duty of employers as to make it expedient to recommend it to them by Act of Parliament. The motive for a workman to insure against accident is direct. He foregoes the use of the premium in order to secure the use of the money which it gives him in case of accident. But what is the motive for an employer to insure, not against accident to himself, but against accident to his workmen? None whatever, except the desire to escape liability to make compensation. Now either he ought in justice to make compensation, in which case there is no need to help him to evade the obligation; or he ought not to make it, and then why should he have to protect himself against it? Of course if an employer likes to make a contract with his workmen that, in consideration of his contributing a certain sum to the insurance fund, he shall not be liable to pay compensation in the event of an accident happening, that is another affair. Both the parties to such a contract are perfectly well able to look after their own interests, and if the workman likes to set the contribution which the master pays towards insuring him in case of accidents of all kinds against the contribution which he would otherwise have to pay towards compensating for a particular variety of accident, no one has any right to prevent him. But to make provision for his doing so by a specific statute would be a perfectly needless interference on the part of the State in matters which the parties concerned are perfectly competent to arrange, and are likely to arrange very much better for themselves than any one else can hope to do on their behalf.

READING MADE UNEASY.

THE Reports of the School Inspectors which are printed in the appendix to the Annual Report of the Education Department bear out with unpleasant uniformity the observations of Lord Sherbrooke upon the kind of reading which is to be had from the higher classes in elementary schools. Without a single exception, they all tell the same story, and that story is one of the most discouraging character. The reading is bad all round. The children never read readily, except when the exercise they are going through, though it may be called reading, is really recitation. Even then, though they may read readily, they read entirely without expression; and, when they are asked to explain the meanings of the words they have used, they show that they have not attached the slightest meaning to what they have been reading. A long string of extracts might be made in support of this statement. But, in truth, it scarcely needs support. When it is considered what intelligent reading means, what are the obstacles to it in the class which fills our elementary schools, and what is the machinery by which it is proposed to overcome these obstacles, there will be no room left for surprise that it is so rarely met with. The power of reading intelligently stands for the power of reading in a way to give pleasure to the reader such books as are likely to fall in his way when he leaves school. However short the list may be—even if it does not include secular books at all, but only the local newspaper—it is plain that it must make a very heavy demand on the intelligence of the children in elementary schools. Among the educated classes children learn to understand and even use words before they are able to read them. Their difficulty lies in identifying the letters with the word rather than in giving the word itself a meaning. Among the poor, on the contrary, the spoken vocabulary is immeasurably more limited than that of any book not expressly intended for very young children. Almost every word that occurs in the course of their reading has to be explained to them; and, as they do not meet with it elsewhere, they have just as much difficulty in remembering it when ex-

plained as though it belonged to a foreign language. This unpromising state of things can only be properly dealt with in two ways. An immense amount of time must be given to reading and the oral explanations by which reading, if it is to be of any use to the children, must be accompanied, and the books read must be of a kind to give the children the help which comes of real interest in the matter read.

It is here that the question touches the controversy recently raised by Lord NORTON. The teaching staff of an elementary school is not at all too strong for the purely elementary work which has to be done, and it stands to reason that if the time and attention of the staff are devoted to other subjects, and these subjects in which only a small percentage of the scholars are presented, the school at large must suffer. At present two things are being attempted, which, if not incompatible in themselves, are certainly incompatible in the circumstances in which the attempt has at present to be made. Such rudiments of knowledge as every child in the three kingdoms ought to possess, and some smattering of secondary knowledge, are being imparted in the same schools at the same hours and by the same teachers. But they are not being imparted to the same children. The secondary knowledge is reserved for the minority to whom, either from greater quickness or from the ability of their parents to keep them longer at school, it can be taught with some chance of its reappearing at the day of examination. The rudiments alone are taught to all the children, and the consequence is that, if the rudiments are insufficiently taught, every hour diverted from teaching them is a wrong to the children who, but for other demands on the teacher's attention, would have at least another chance of mastering them. It may seem that, by the time a child is twelve years old, he ought to have learnt a good deal more than merely how to read and write and cast accounts. So he would have done if his education had been carried on at home as well as at school. As regards reading and writing, at all events the education at home is of even more importance than the education at school. The children of the well-to-do classes begin to read something for themselves very soon indeed, and they want to write a letter to a mother or a sister almost as early.

The children of the poor have for the most part no similar advantage. Whatever else they pick up at home, they do not pick up a literary vocabulary. Consequently, the work which with other children is spread over the whole year, Sundays and holidays included, has with them to be compressed into that fraction of the school year which is actually passed in school. It is this that makes the reasonable advocate of popular education so jealous of any additions to the school course. He objects to anything being taught which can conflict with the teaching of those indispensable rudiments among which reading is the first and chief, and he knows of no test by which to ascertain whether the teaching of this or that other subject does conflict with the teaching of reading, except the fact that, along with this or that other subject, reading is thoroughly well taught. If the reports of School Inspectors are to be taken as evidence, there are very few schools indeed which conform to this test. In all the reports which have been printed this year, there are the same lamentations over the miserable inability of the great majority of the children either to read what they see or to understand what they read.

The incubus of the Fourth Schedule affects the teaching of reading in another way. There are many subjects in which a good teacher can make up for the faults of a bad book. The text which he has to interpret may be barren or obscure, but he puts so much life into it by his explanations that its defects do the children no harm. Indeed, they may even do them service, because they stimulate the teacher to improve upon his text, and to trust more to himself and less to the book. But in reading the book is everything. No explanation of the teacher can here be anything more than an explanation of the book. The words which the children master, and the ideas which they painfully take in, must be those given them by the book. If they are not, the lesson may be an excellent lesson, but it will not be a lesson in reading. Now the first condition of a good reading-book is that it shall be good to read; and, unfortunately, this is precisely the condition which the ordinary reading-books used in elementary schools fail to fulfil. They are not good to read, and consequently they present nothing which can induce a child to read them. We only wish that the admirers of "extra subjects" could be forced to learn a foreign language from a reading-book modelled after the fashion of those in use in elementary schools. If an educated man wants to learn a foreign language, he begins, as soon as he can read at all, with something that he expects to find interesting. He reads a novel, unless he has a distaste for novels, and then he reads poetry or some author whom he has hitherto known only by repute or by a translation. The motive is the same in all three cases. He wants to have the necessary drudgery of mastering a foreign language lightened, and he chooses books which he thinks will lighten it. Precisely the same course should be taken with children in elementary schools. The first question asked about the reading-books in use in a school should not be whether they contain scraps of science or morality, but whether they are such as the children are likely to care for. Are they amusing? Will they tempt a child to read? Will he be eager to carry them home, that he may get on with the story? Of how many reading-books used in elementary schools can any one of these things be said? We do not know; but, to judge from the reports of the Inspectors, we should fancy of very few. The compiler and the chooser of reading-books have the inevitable extra subjects in their minds, and their judgment of a book turns upon the degree in which it paves the way for extra subjects. It rises in their estimation, not in proportion as it is readable and likely to be read, but in proportion as it gives information which may by and by be got out of the children in such a form as to secure an extra grant.

The great sinner in this matter is the Education Department. The greatest sinners do not always deserve the most blame, and we admit that, in this case, the Education Department has only walked in the lines marked out for it by Parliament and public opinion. But it is the action or inaction of the Education Department that does more than anything else to bring about this disastrous state of things. The most sensible school managers are not proof against the magic of a Government grant. They may regret that Government grants are given for such and such things, and wish that they were given for such and such other things; but, so long as they are given, they will wish the children in their school to earn them. It is not merely that they want the money, though, if they neglected this consideration, they would naturally come off badly with the ratepayers, or with their subscribers; what they want still more is the credit which a large Government grant carries with it. To expect, therefore, that any effectual reformation can come from below is vain. So long as the Education Department goes on offering money for the kind of proficiency which at present finds favour with it, so long school managers will go on producing that kind of proficiency, and children will leave school without having learnt to read.

BERE REGIS.

WE remarked not long ago on the danger there is, in these days of rapid travelling along great trunk lines, of England becoming less intimately known to its own people than many a foreign country, its more sequestered nooks and corners being apt to remain a sealed book to those who know the Continent by heart. We were then especially referring to the county of Chester. But what is true of the North is equally true of the South; and Dorsetshire is, we imagine, as much a *terra incognita* to the majority of Englishmen as the County Palatine. Girt on its four margins by railways, the whole of the central district, with its widespread moorlands and swelling chalk downs, is still practically inaccessible to the ordinary tourist. There are good roads, it is true; but the railway has driven public conveyances off them; and even those who can afford to hire a vehicle for a long drive do not always find such a thing attainable when they want it.

Few places suffer more from this artificial isolation than the once market-town whose name stands at the head of this article. Formerly a place of considerable importance, a royal residence from the days of our Anglo-Saxon kings to the thirteenth century, made a free borough by Edward I. in 1288, and touching English history at some not inconsiderable points; the seat of one of the greatest of the South-country fairs, that of Woodbury Hill, once rivalling those of Stourbridge and Weyhill; the resort of traders not only from Exeter and Bristol, but even from Birmingham and Norwich, where the tolls alone brought in a hundred pounds a day to the lord of the manor—Bere Regis is now almost unknown even by name, and is only visited by the cultivated few whom the fame of

its unusually fine and interesting church, admirably restored by Mr. Street, tempts across the stretch of bleak moorland which separates it from the nearest railway station. Nor, with all its historical associations, does Bere Regis, though somewhat better than "Murray's" description, "a poor place of thatched cottages," offer much that is attractive at first sight. Climbing a chalk spur watered at its base by one of the crystal affluents of the river Piddle or Puddle—no mean river in the eyes of the men of Dorset, which has inflicted its grotesque name on a whole string of unlucky villages on its alder-lined banks, Affpiddle, Tolpiddle, Piddletrenthide, and the like—the long street with its wayside hostelries and village shops, their windows full one day of earthen teapots, another day of hobnailed boots, and a third of bacon, pervaded by that mingled odour of cheese and leather, coffee and soap, "et omnis copia narium," which is so familiar and so indescribable, certainly does not present any object to detain the traveller. We must add, however, that the local joiner has, by the neatness of his tiny tables, made a name for himself far beyond that usually won by village tradesmen. We vainly look for the stone-mullioned houses which render the villages of the adjoining county of Somerset so picturesque. Nor is this surprising. Not only is building stone a rarity in this district of chalk and sand, but Bere, like most of the Dorsetshire villages with their cob-walls and thatched roofs, has always been getting burnt down. The local annals tell of repeated conflagrations, the most disastrous of which was in 1788, when the vicarage, the parish registers, and more than forty houses were burnt, and the church was barely saved by the exertions of the people. The extent of the calamity and the sympathy it evoked may be measured by the fact that nearly 1,300*l*. was raised in the county alone for the relief of the sufferers.

The name "Bere Regis" at once arrests attention by its singularity, and one asks with some curiosity whence it comes and what it means. Such questions regarding local names are usually more easily asked than answered. We are of course met at the outset with the popular fable that "Bere" means the drink brewed of malt and hops, and that it was so called by the ubiquitous John Lackland, who, in spite of his being the very vilest monarch that ever sat on the English throne, has stamped his name on more places than any other English sovereign save perhaps Queen Elizabeth. The story is that on one of his frequent visits here—his Itinerary records at least fifteen—he was so delighted with the beverage which was set before him that he decreed that the town should ever thereafter bear its name, and that "regis" should be added to indicate the royal approbation of the Dorset brewing. Unfortunately for the popular myth, the place bore this name three centuries before King John, and its origin must be sought elsewhere. What that origin is, philologists are by no means agreed upon. The last edition of Hutchins's *Dorset*—now almost a model county history, due to the enterprise of a local bookseller, aided by unbought loving labours such as few counties could match—derives it from a word, if such word there be, in the præ-Saxon tongue, denoting low scrubby wood, such as once covered the whole of the district, and of which we have a remnant in the charming oak wood between Bere and Bloxworth. Others, ignoring the wood altogether, and regarding the present naked aspect of the country, both down and heath, derive it from the Old-English *baer*, bare, open. With more probability, Mr. Isaac Taylor, taking a wider field of induction—including the Devonshire *beres* or *beares*, such as Loxbeare, Kentishbeare, Aylesbeare, Rockbeare, &c.—sees in "bere" the Scandinavian root "byr," preserved in the "boer" of the Icelandic farms, akin to the "bys" which mark the Danish settlements, especially in Lincolnshire and Yorkshire. "Bere" or "Beer" occurs frequently as a local name in the West of England. "Beer," near Seaton, where the Danes landed in 967; "Beer Ferris," "Beer Crocombe," in Somerset, and "Beer Hacket," in the same county of Dorset—all must be referred to the same root, and we think Mr. Taylor has indicated the most probable one.

But long before the Scandinavian pirates occupied the country, Bere and its vicinity was the seat of a considerable population. No district in England abounds more in hill-forts—some, like the huge entrenched "castellum" of Badbury Rings, of immense strength—earthworks, pit-dwellings, sepulchral barrows, and other traces of a very early habitation. That the civilization was not of a high type is shown by the contents of the barrows. The urns contained in Mr. Durden's most instructive collection at Blandford are of the coarsest unbaked clay, of the rudest make and the simplest manipulation, and of articles of more elaborate workmanship there is an almost entire absence. The Romans also have left their traces here. The "Via Iceniana" from Old Sarum to Dorchester ran along the north of the parish, where Roman remains have been turned up not unfrequently. A leaden coffin containing a nearly perfect skeleton, the feet covered with nail-studded *caligæ*, was found some years since near the road between Kingston and Bere, on the supposed site of "Ibernium." In Saxon times Bere, as we have mentioned, became a royal residence, and gained its right to the affix which distinguishes it from the other Beres. It was to Bere that, according to Bromton, Elfrida retired after the foul murder, either by her order or by her connivance, of her stepson, Edward the Martyr, at Corfesgate. "A worse deed,' says the Chronicle, "had never been done since the English came into Britain," "Ad quandam sui juris mansionem quæ Bere vocatur, continuo secessit ut super hoc quod fecerat nemo de ea suspicionem haberet" (p. 874). and here we may place the scene of that beating of the young king, her ten-year-old boy, Ethelred, with big wax altar-candles, there being no stick at hand, when the poor lad wept for the death of his brother which had given him the throne. "Wherefore," writes the Chronicler, "Ethelred ever hated wax candles, and would have none burnt before him all the days of his life."

It is a long leap from Elfrida and Ethelred to King John, but if the intervening sovereigns, Saxon or Norman, sojourned at their "mansio" at Bere, their visits are unrecorded. John appears to have had a great partiality for the place. It was near Corfe Castle, his favourite stronghold and the scene of some of his foulest atrocities, where Eleanor "the Damsel of Brittany," Prince Arthur's sister, was immured for years, and four-and-twenty of the knights taken at her brother's Castle of Mirabel were starved to death, and in which he kept his treasure and regalia; it was also within easy reach of the sea, which with the restlessness of an uneasy conscience, he was for ever crossing and recrossing. After having landed at Studland, on the abandonment of the proposed invasion of Normandy in 1205, he came on to Bere, where, in a letter dated May 25, in a very unusual fit of piety, he ordered his bailiff to cause "a fair crucifix to be set up in our chapel at Bere," "Teste meipso apud Beram"; and, his injunction not being carried out, he repeated it June 25. The monarch's care for his personal comfort at Bere is shown two years later, when by an order dated March 9, 1207, he commands that a kitchen—*una coquina*, often in those early days a mere temporary wooden shed—"be erected for his service at Bere." In the same year, July 2nd, on his iniquitous exaction of the thirteenth of all movables from laymen and clerics alike throughout the land—so nobly resisted by Archbishop Geoffrey of York before the Council, fearless of the banishment with which his patriotism was rewarded—he appoints this as the place of reckoning for the 20,000*l*. extorted from the realm, "paid by the Justiciary Fitz Peter into our chamber at Bere by the hands of Ralph his chamberlain." With John the royal occupancy of Bere ceases, and the manor passes for a brief space into the hands of Simon de Montfort, to whom it was granted in 1259 by Henry III. Ten years later, when the great Earl had been four years in his grave, the manor of Bere passed to the King's brother Edmund, who the same year granted a moiety of it to the Abbess of Tarent, which gave that lady and her successors, "a fair, a market, free warren, and the whole forest of Bere." At the Dissolution it passed to Robert Turberville, whose family had been possessors of the other moiety by royal grant for many generations. The last Abbess, Margaret Russell, lived to enjoy her pension of forty pounds till the tenth year of Elizabeth. By her will, dated January 20, 1567-8, she desired to be buried in Bere Church, and bequeathed to her "cousin John, Lord of Bedford, her piece of plate double gilt, and a great ring, which my Lord of Bedford gave her." This "John, Lord of Bedford," was the first earl of that name, the founder of the great house of Russell. Could one who had so fattened on abbey spoils accept the deprived Abbess's cousinly bequest without a qualm?

The Turbervilles who thus on the Dissolution became possessed of the whole manor of Bere were the descendants of that Pagan de Turbida Villa, who, coming over with William the Conqueror, figures as one of Robert FitzHamon's twelve knights in the picturesque, but in its details somewhat untrustworthy, tale of the conquest of Glamorgan, who settled at Ewenny, and was buried in the Priory of that place, to which he had been a considerable benefactor. To the Bere branch of this family belonged good Bishop James Turberville of Exeter in Queen Mary's reign, on whom old Fuller makes one of his most detestable puns in reference to the impoverished state of his see, that "he was a Baron, but a bare-one, so miserably had that cathedral been pilled and polled," and who, "though he carried something of trouble in his name, showed nothing but mildness and meekness in his nature"; "very gentle and courteous," writes Holinshed, "most zealous in the Romish religion, but nothing cruel or bloody," obstinately refusing to light the fires of persecution in his diocese, and, while he grieved sorely for their heresy, by every means in his power shielding those who had made themselves amenable to punishment. "In an age of troubles he was a peacemaker; in an age of persecution he was mild and lenient; amidst overbearing prelates he was an example of meekness; and as he showed mercy in prosperity so he found it in adversity"; for, in spite of the clamorous demands of Day, Provost of Eton, and Nowell, Dean of St. Paul's, in their sermons, for "the killing of the caged wolves," he and the other bishops committed to the Tower for refusing the oath of supremacy escaped. Bishop Turberville's father, John Turberville, was a warm supporter of Henry of Richmond, and a month after the battle of Bosworth Field was rewarded for his services by the grateful monarch with the offices of Constable of Corfe Castle and Marshal of the King's Household. In his will, dated 1535, he desires to be buried in the church of Bere Regis. "Yn my own yle before the ymage of our blessid Ladie, yn one of the tombs yn which Sir Richard Turberville and Sir Robert Turberville mine ancestors hath bene buried." He further directs the east window of his "yle" to be newly made and newly glazed in such manner and in such form as his wife and executors might think most convenient. The Turberville aisle in Bere church is the south aisle of the nave. The present east window is one of Decorated style, of reticulated tracery; but it only dates from the recent restoration, though we believe it is an accurate reproduction of the tracery which was found built into the wall in fragments. The window named in the will was probably that in the east bay of this aisle; a rather singular composition of five lights

under an almost flat arch, with a richly panelled soffit. The original glazing having entirely perished, it is now refilled with the armorial bearings of the Turberville family and their alliances in stained glass. The aisle contains several ancient tombs without inscriptions, which must be those referred to in the will. Another member of the same family, a century later, Sir Troilus Turberville, was captain of Charles I.'s life-guard of cavalry, and was killed on the King's march from Newark to Oxford—his last independent movement as a sovereign at the head of his forces—in October 1645. The Manor-house built by Thomas Turberville in 1587 on the site of Elfrida's "mansio" and John's "hospitium," a very good example of its date, was unhappily demolished a few years since. Only one gable end of the mansion remains, built in as part of a farmhouse in the meadows to the south-east of the church. We can ill afford to lose such historical landmarks.

But the name which confers the greatest celebrity on Bere Regis is that of Cardinal Morton, Henry VII.'s chief adviser in fiscal matters, and the introducer of the system of mis-named "benevolences" known as "Morton's Fork," or "Morton's Crutch," but more honourably known as the patron of Sir Thomas More, at whose table the scene of his *Utopia* is laid, and as the Chancellor and benefactor of the University of Oxford. Dean Hook questions his being a native of this parish, stating that he was born in the adjacent parish of Milborne St. Andrews; but as his father who had migrated from Nottinghamshire certainly lived in the parish of Bere, at the Manor of Milborne Stileman, we may safely accept the local tradition. The chapel at the east end of the north aisle of the parish church, corresponding to the Turberville chapel on the south, was the Morton chantry, and the burial-place of that family, to which the Cardinal bequeathed a maintenance of one priest to say mass for twenty years for his own soul and those of his parents and kinsfolk buried here. Morton became incumbent of Bloxworth, the adjacent parish to Bere Regis. After his flight from the disastrous field of Towton, in attendance on Queen Margaret and the young Prince, he was attainted by the victorious Lancastrian party as "John Morton, late parson of Blokesworth, in the shire of Dorset." Local tradition assigns to Morton the erection of the richly carved nave roof, which, according to one version of the story, he had caused to be executed in his diocese at Ely and sent down here; while according to another version, contradicted by the style of the ceiling, the timbers with their huge and coarsely fashioned figures were carved in Rome. The character of the roof is quite unlike West-country work, and bears a sufficient resemblance to the noble hammer-beam roofs of the Eastern counties to give some colour to the Ely story. But the design is far too clumsy, and the execution too coarse, to warrant our attributing it to an East Anglian craftsman. It is more like the work of a man who had never seen a hammer-beam roof, and was endeavouring to carry out an uncongenial design only known to him from description or inartistic sketches. That Morton had architectural taste, and was not averse to be consulted on such matters, is shown by Prior Sellinge's letters to him asking his decision as to the form of the pinnacles of the "longest steeple" at Canterbury Cathedral which he was then building.

Whatever the origin of the roof of the nave of Bere Church, it is certainly a very remarkable, though hardly a beautiful, work. It is an ordinary tiebeam roof, with arched braces. The singularity consists in the introduction at a lower level of a series of figures projecting horizontally and intersecting the arched braces and doing duty as hammer-beams, where no hammer-beams have any right to be. The result is great heaviness of effect, the timber being much in excess of what is needed, confusion of construction, and redundancy of ornament. However, the general effect of this long line of variously habited figures, stretching from end to end of the nave, the colours of which have been carefully renewed in Mr. Street's most conscientious restoration of the church, is undeniably picturesque, and, as Mr. Street remarks, "the rude magnificence of such massive timbers covered with a rich and quaint carving such as is rarely met with is very striking"; but it is an example rather to be avoided than imitated. The naturalism of a huge head, with fat rosy cheeks, staring down on the congregation from the centre of the eastern bay—representing the head of St. John the Baptist, to whom the church is dedicated—is painfully ludicrous. It is as far as possible from the ideal of the desert ascetic, macerated by his long continuement in the castle of Machærus. The church itself is in its main fabric Transition Norman, with low pointed arcades on cylindrical columns with square abaci. But it has received extensive alterations and additions in Decorated and Perpendicular times, which render its architectural history rather perplexing. Every ancient feature has been retained with such scrupulous care by Mr. Street that—which is very unusual in restored churches—its history may be traced more readily now than before its restoration. A strong pressure, we believe, was put on Mr. Street to replace the old chancel arch, of inconveniently contracted dimensions, with a wider and handsomer structure; but he rightly felt that this plain, rude arch with its huge squints—mere inartistic holes in the wall—was a part of the history of the fabric which it would be wrong to remove. Few churches needed restoration more than that of Bere Regis, with its pens and boxes of every shape and size reaching so high as to hide the capitals of the columns, its tottering walls and its mouldering roof, the hiding-place of swarms of bats which used to come out on dark afternoons, to the great delight of the boys, who struck them down with boughs of trees as they flitted eerily about the church and dashed in the faces of the few worshippers nodding under the good old vicar's drowsy sermon. If all restorations were like this, the Society for the Protection of Ancient Buildings would lose the last pretext for its too often meddlesome interference. Bere Church, it should be added, enjoys the too rare advantage of having all its windows filled with stained glass, executed by the same artists, Messrs. Hardman, in pursuance of one design. The Gospel history, commencing with the Nativity in the west window of the north aisle and culminating in the Crucifixion in the east window, is carried round the church, finding its consummation in scenes from the Apocalypse in the south aisle. The grisaille windows of the north aisle are almost perfect both in design and execution. The east window is unfortunately the weakest of the series, and should be replaced by a worthier specimen of the artist's skill. The great west window of the tower—itself a noble pinnacled structure of Perpendicular date, with the richly panelled belfry arch so characteristic of the west counties—contains the history of St. John the Baptist. All these windows were, we believe, the gift of the lady of the manor, who was also the chief contributor to the restoration. The monuments are mostly late and not specially interesting. There are some coarse examples of sixteenth-century canopied tombs. One epitaph of the end of that century deserves to be read. It recalls one of Quarles's "Emblems," "Tinnit, inane est":—

> I Skerne doe shew that all our earthlie truste
> All earthlie fayers and goods and sweetes are dust.
> Look on the worldes insyde and look on me,
> Her outsyde is but painted vanitie.

Erected and finished by Margaret Skerne his wife, which caused this worke to bee made Ano Dni 1596.

Another mural brass to Andrew Loup, of Hide, d. 1637, "ad quisquilias decessoris sepositus," affords a curious example of the pedantic scholarship in vogue at the beginning of the seventeenth century, which loved to hunt up the most out-of-the-way words the Latin language furnished and work them up into enigmas. We subjoin the closing sentence, premising that "damnas," like "transilis," which is the first word of the epitaph, is a noun, and not a verb:—

> Extremo ætatis progressu patrimonium invenit narcoticum, quo devictus per triennium morbo laborans Herculeo tandem voti fluminei damnus memor expiravit, antequam protoplasti vivendi reliquias per decennium peregerat.

We are sure the Vicar of Bere would be grateful for a satisfactory solution of what has hitherto baffled all would-be Œdipuses. Another modest brass plate, almost hidden behind the organ, bearing the words so familiar to Balliol men, "Verbum non amplius, Fisher," records the builder of the decidedly ugly, but very commodious, south-west wing of that college facing Broad Street, who, exchanging Newton Ferrers for Bere, died here in 1773, in his 90th year.

When we add that the mother of the once famous "Mrs. Elizabeth Carter," the translator of Epictetus—the sale of which actually produced her a thousand pounds—was a Bere heiress, the daughter of Mr. Richard Swayne, who was married in this church in 1718, we have told all that our readers may at present care to hear about Bere Regis. If what we have said leads them to pay it a visit, they will be well repaid for their trouble. The neighbourhood is singularly attractive, with its fir-crowned entrenched hills, its far-stretching views of Corfe, Purbeck, and Wareham, and its wide, open heaths, rich in natural treasures, where the *Exacum filiforme* with its tiny golden cups, and its first cousin, the *Gentiana Pneumonanthe*, may be gathered in abundance, and where the entomologist may find burrowing spiders, with their gossamer-lined tubes, and other rarities to add to his cabinet.

ONE MORE UNFORTUNATE.

THERE is, or ought to be, weeping and wailing among the Anti-Vaccinationists, unless gratitude has accompanied common sense in abandoning the minds of those amiable fanatics. Mr. Dodson, who had charge of the new proposal for a smallpox licence; Mr. Dodson, who but a few weeks ago drew tears from all Anti-Vaccination eyes by nobly exclaiming that he was not prepared to authorize policemen to tear infants from the arms of their weeping mothers; Mr. Dodson has ceased to be a member of the present Parliament. The President of the Local Government Board is now undergoing the same unpleasant experience which not long ago afflicted his colleague, the Home Secretary. He can attend Cabinet meetings and join in the deliberations of his fellows if he pleases; but the doors of the House of Commons are barred to him. Others must take charge in that Assembly of his favourite schemes; others must draw pictures of the brutal minion of the law wresting infants from their mothers, when the latter have committed no other crime than such as may be implied in the desire to apply to the overgrown population of England the same measures which have proved so effectual in thinning that of the once crowded islands of the Pacific. While his colleagues do the business of the nation in the nation's Council, Mr. Dodson has nothing left but—in the words of the poet—to sit upon the ground with the Lord Advocate, and tell sad stories of the defeats of Ministers. Mr. McLaren himself is probably getting used to rejection now that Berwick has endorsed the refusal of Wigton. But he at least is free to contest whatsoever seat may be vacant,

while the more important dignitary is excluded from his own particular preserve, and must look out for some constituency with which he is at present unacquainted. Sir William Harcourt will no doubt give him that counsel and comfort which may be expected from an amiable statesman, himself by no means *ignarus mali*. But even Sir William's well-known desire to make all things pleasant to all men will hardly induce him to promise Mr. Dodson such a special providence as befel himself. There is, it is to be feared, but one Derby and but one such heroic partisan as Mr. Plimsoll. There is, it is true, a vacancy at Liverpool; but Lord Ramsay's is a minority seat, and it is by no means certain—we hope we may say that it is very unlikely—that Mr. Dodson would stoop to the compliance which the heir of "Dalhousie of an old descent" did not disdain. So that for the present, at any rate, there is nothing for the amateurs in the matter of diffusing pestilence to do but to join Mr. Dodson and Mr. McLaren in their session on the ground, and to cast ashes upon their heads and bodies. Mr. Gladstone himself has recently declared that he has not given to the measure which raised their hopes that attention which it deserves; a statement which at the latter end of July, in a crowded Session, cannot be said to bode well for the future diffusion of smallpox in England.

The calamity which, to speak more seriously, has befallen Mr. Dodson, and which, as far as he is personally concerned, everybody must sincerely regret, happens from the general political point of view to be an exceedingly instructive calamity. The fate of the President of the Local Government Board and of his colleague, Mr. Lawley, has some important points of difference from the fates which have recently befallen so many members of Parliament. It will be remembered that last August Mr. Gladstone, who was then in the very heat of the contest of words which preceded for many months the actual trial of strength at the ballot boxes, went to Chester to support Mr. Lawley's candidature. He eulogized his youthful friend and his political principles, in a manner which did not presage the remarkable difference of opinion which has since developed itself between them on the subject of the Irish Compensation Bill; and he stirred up the men of Chester to the acquisition of both seats in a manner which provoked a somewhat warm protest from Mr. Raikes. Mr. Raikes, by the way, if he be a person of unchristian vindictiveness, has of late had more than one compensation for his mishap in April; for he has seen a decision of his successor in the Chair of Committees practically overruled by the Speaker, and the election of his successor at Chester declared void by the election Judges. But to return to the history of the Chester election itself. It is to be observed that before Mr. Gladstone's arrival vigorous means had been taken to organize victory in the city on the Dee. An association of the kind which it makes Mr. Chamberlain so angry to hear called by the name of Caucus had been started; and, when Mr. Gladstone spoke, he spoke to the Liberal Three Hundred in fact, though not in name. The present Prime Minister was long mute on the subject of these organizations, and he did not on this particular occasion break his silence. But his address, read to-day with the assistance of the spectacles furnished by the judgment of last Saturday, is obviously directed to the party organization which had been just arranged. He exhorted his hearers to "try to handle that which lay within arm's length"; and the Chester Three Hundred evidently took this practical advice in the most practical spirit. Indeed they worked so vigorously upon everything and everybody within the reach of their arms and pockets that Mr. Dodson and Mr. Lawley are at this moment seatless men. Some suspicion of a possible, if not probable, excess of pecuniary zeal seems to have entered the experienced mind of Mr. Dodson, and he made some faint effort to conduct his canvass on a basis separate from that on which the energetic Three Hundred were obeying Mr. Gladstone's injunctions. But it was all in vain. He and his colleague were the nominees of the Three Hundred; they were returned by the exertions of the Three Hundred; and those exertions were directed much more by an earnest desire to apply the doctrine of arms' lengths than by cold-blooded consideration of the laws of bribery. Mr. Dodson's Committee and the Three Hundred became soon, if they were not always, one in the eye of the law; and for the acts of the Caucus the Committee and their candidate were responsible. We have of course no intention whatever of hinting that the leaders of that august body—if anything so Republican as a Caucus can be said to admit of leaders—bribed, or wished to bribe. But all the patriots of the Three Hundred were not as they, and so there came woe upon Mr. Dodson and Mr. Lawley. It is possible that but for the Caucus they would not have been elected for Chester; it is certain that but for the Caucus they would not have been unseated for that ancient, but, according to Mr. Justice Lush and Mr. Justice Manisty, scarcely pure or independent, constituency. Mr. Salisbury, the chairman of Mr. Dodson's own Committee, a former member for the city, and seemingly a pillar of the Three Hundred, complains that, "If counsel had not thrown up their briefs, a very different complexion might have been put upon the case." This zeal of Mr. Salisbury's is more ardent than wise. It may be suggested to him that eminent counsel (one of whom, by the way, was, in this instance, Mr. Waddy, a Liberal of the Liberals) do not usually throw up their briefs unless a case is absolutely, and, what is more, damagingly hopeless. Taking Mr. Salisbury's words in their literal and grammatical sense, we are rather inclined to agree with him. It is very probable that, if counsel had not thrown up their briefs, a different complexion would have been put on the case; but it would almost certainly have been a complexion less, and not more, favourable to Mr. Salisbury's party.

Thus the Chester election petition presents much matter for the consideration of the friends of the Caucus as well as for its enemies. We have said that it probably seated and certainly unseated Mr. Dodson, and it is not uncharitable to suppose that what has been done on the housetops in Chester has been done under the rose elsewhere. The comparative merits of the old and the new system cannot be better illustrated than by comparing the cases of Chester and Westbury. In the latter case, the sitting member was undisturbed by the Judges, though, if we mistake not, clear proof was given of acts of the most open bribery committed by his injudicious supporters. But these supporters were in no way officially connected with his candidature. Therefore—and very justly—he was not held responsible for their acts. Now in the case of a Caucus it is impossible for a candidate to avoid solidarity with the new institution. In the first place, he cannot dispense with it, and in the second, as not a few instances have shown, it will take good care that he does not dispense with it as a matter of fact. The *amour propre* of these curious fungoid growths of English politics is as remarkable as their activity. Besides, one of the chief boasts of Mr. Chamberlain and his friends is that the Caucus system, by providing large numbers of voluntary workers, dispenses with the necessity of paid canvassers and agents. Now it is a universal experience that voluntary workers are always liable to outbreaks of indiscretion, from which the sober zeal of hired labourers is comparatively exempt. From all which it would appear that the Caucus is a singularly undesirable mistress for a political aspirant, inasmuch as he is equally liable to be rejected by its hate and unseated subsequently by its love. Under the old arrangement Mr. Dodson's was a perfectly safe seat, and he must curse the day when Mr. Gladstone's fervid eloquence introduced Mr. Lawley to Chester, and the energy of the Three Hundred set to work to put in practice the principle of influencing every man within the length of their arms and purses. On the other hand, it would be exceedingly interesting to get behind the scenes on which some of the older organizations of the same kind work, and to see how far—at Birmingham, for instance—the same means are applied to produce the same ends. It may be said that no imputation has ever been cast upon the purity of the Birmingham elections. The answer to this is that the Birmingham "hundreds" have had a much longer time to perfect their organization, and ensure the secresy of its proceedings, than the hastily extemporized Three Hundred who have seated and unseated the President of the Local Government Board. It may be that the purer political sentiment of the town does not require those coarse stimulants and rewards which are necessary in the city—and also it may not be so. The fact remains that the prediction of the opponents of the Caucus that it would lend itself readily to corrupt practices has been fulfilled, and that their prediction that it was a tool with a great many edges and likely to cut in several unexpected directions has been fulfilled likewise. Such is the more important and permanent result of this remarkable petition. Its immediate result is an addition to the little troubles of the Government. It is awkward that a Cabinet Minister should be not only unseated, but should be under a partial disqualification for re-election. It is awkward that a Cabinet Minister, however personally guiltless, should thus be discovered to have been seated by corrupt means. It is awkward that those, in this instance, corrupt means should be the means by which a great part—according to some ardent politicians, the whole—of the Ministerial success was achieved in the late elections. All these things are, we say, awkward for any Government, and for any Government but the present they would be very awkward indeed. But the present Government, to use an expressive Gallicism, "has seen plenty of others." They are almost inured to the occasional retirement into the background of a Minister or two, and we should not be surprised if Mr. Gladstone discovered that it was rather an advantage than otherwise to have at least one colleague roaming about, and feeling the pulse of the country, even if that pulse should be as unfavourable as the Lord Advocate has found it. For the present Prime Minister when in power is nearly as expert in finding reasons for thankfulness in the smallest mercies as he is, when out of power, in finding reason for dissatisfaction with the greatest.

PLEASURES AND PAINS OF GARDENING.

"THE Purest of Humane pleasures," as Bacon calls a garden, is a theme that has been often sung, and it might well be asked whether anything can be added to the thousand works in verse and prose that have glorified, described, or analysed it. If Virgil passed the subject by with a graceful apology, we have the *Hortorum Libri* of René Rapin, *multo elegantissimi poetæ*, as his title-page calls him—a poem which is not perhaps as good as the Georgics, though it tells us a great deal about French gardening under the Grand Monarque. If Wordsworth is less inspired when dealing with Mr. Wilkinson's spade than when dealing with Michael's "sickle, flail, or scythe," it is possibly because Cowper had anticipated him, and had done epic honour to "the prickly and green-coated gourd." In prose, if the garden has not received its due in some established classic, as the river bank has received it in *The Compleat Angler*, it has furnished an occasional topic to all sorts of writers,

from Evelyn, the prince of dilettanti, to Hawthorne, the subtlest of dreamers. The truth is that a subject which interests everybody is not easily exhausted. Rapin's *Horti* do not say the last word on the art of gardening, nor Hawthorne's meditations on bean-vines and musk-melons the last word on the philosophy of it. Everybody, except those cooped up in the heart of cities, is a bit of a gardener, and everybody's experience of his garden is a little unlike that of everybody else. Hence there is room, not only for half a score of gardening periodicals, but for any quantity of philosophizing on the pursuit and its end and aim.

The garden that Bacon describes in his famous essay is no more the concern of plain people than is the palace of Versailles. Thirty acres of ground is "indeed prince like"; it is an amount that is rather to be admired than envied. "I like well," says Bacon, "that Foure Acres of Ground be assigned to the Greene; Six to the Heath; Foure and Foure to either Side; and Twelve to the Maine Garden." No doubt the owner of a Baconian garden has his joys and sorrows; but they are the joys and sorrows of the great, like those that go with garters and dukedoms. The true pleasures and pains of gardening belong to a lower stage of existence altogether, and can only be felt under humble conditions. To have more than one gardener in your service is to put yourself outside their sphere; indeed it may even be said that to have one complete and thoroughly satisfactory gardener is to put yourself outside it. "The original Adam's occupation," as Hawthorne calls it, can only be really experienced by the man who feels himself personally responsible for his garden. Three conditions at least have to be fulfilled if the pains and pleasures are to be real. The garden must, in the first place, be, in the main, of his own making. To look after trees and shrubs that were in existence before he came to the house is, to quote Hawthorne again, "something like educating and nursing another person's children." In time, no doubt, you can adopt them; or, if the garden is one in which you and they have grown up together, you can develop a brotherly feeling towards them which is nearly as good as the paternal one. But unquestionably the apple-trees you have planted, the roses you have grafted with your own hands, are nearer to you than those you have merely come in upon; and this fact is one that should be some compensation for the bareness and thinness of a new garden. The pleasures of a garden are mostly pleasures of anticipation; he can feel nothing of them who cannot look forward a little and see the flower in the seed, the covering of blade and leaf in the bare February ground. A second condition is that the garden should not be too large. It should be capable of being taken in at a glance; though of course it may have as many departments as would satisfy even Bacon himself. There must, no doubt, be a pleasure in organizing a garden like that of "my brother Evelyn at Wotton," and in "removing a mountaine overgrowne with huge trees and thicket," in "levelling that noble area where now the garden and fountaine is"; but it is presumably a pleasure like that which Wren felt in building St. Paul's. An acre, at most, is what the simple sons of Adam should aim at; and every flower-show reveals the fact that there are hundreds of people who work wonders with gardens not more than a quarter that size. Lastly, the work should be done in great part by the proprietor himself. If he does not dig, he must at least plan; on him, and not on his gardener, must rest the prime responsibility for the success or failure of his flowers and his crops; he, if he is to understand the pleasures and the pains, must not be able to delegate to any one the direction of affairs. Moreover, a little human weakness, intellectual or moral, on the part of the gardener, is not a bad thing. A paragon is apt to take things too much into his own hands.

Given a garden that you have made, or helped to make, that is not unmanageably large, and that is worked by one man under the owner's eye, what precisely are the joys and sorrows that attend its culture, and how are they balanced? It is to be feared that the eminent writers who have dealt with the subject are not to be implicitly trusted on this point. The poets have been as one-sided as imaginative people usually are; one and all, from Homer to Cowper, have tried to show that Paradise was to be found in Phæacia and at Olney, as well as in Eden. Poor Cowper may be excused for his enthusiasm; he owed too much to the "blest seclusion from a jarring world" to speak with measure of the occupation that nearly kept him sane. But people in general have to own that in the garden, as out of it, there are good and evil, pleasure and pain. Still the pleasure is unmistakable, as far as it goes:—

> So manifold, all pleasing in their kind,
> All healthful, are the employs of rural life,
> Reiterated as the wheel of time
> Runs round; still ending, and beginning still.

The quietness, the serenity of the garden has been a proverb since the days of Virgil's Corycian old man, and probably was a proverb long before. "I do most of my thinking when I am spudding up the plantains on my lawn," an Oxford Professor used to say; for the garden presents just that union of quiet and stimulus under which thinking flourishes best. The quiet, however, is a quality which it shares with the other "employs of rural life"; it is in the exact nature of the stimulus that it differs from them. The peculiar imaginative pleasure which comes from watching the things as they grow has never been so well described as by Hawthorne in that exquisite passage of the *American Note Books*, in which he tells the simple story of his life at Concord:—

> I love to watch the successive development of each new vegetable, and mark its daily growth, which always affects me with surprise. It is as if something were being created under my own inspection, and partly by my own aid. One day, perchance, I look at my bean-vines, and see only the green leaves clambering up the poles; again, to-morrow, I give a second glance, and there are the delicate blossoms; and a third day, on a somewhat closer observation, I discover the tender young beans, hiding among the foliage. Then, each morning, I watch the swelling of the pods, and calculate how soon they will be ready to yield their treasures. All this gives a pleasure and an ideality, hitherto unthought of, to the business of providing sustenance for my family. I suppose Adam felt it in Paradise; and of merely and exclusively earthly enjoyments, there are few purer and more harmless to be experienced . . . After all, the greatest interest of these vegetables does not seem to consist in their being articles of food. It is rather that we love to see something born into the world; and when a great squash or melon is produced, it is a large and tangible existence, which the imagination can seize hold of and rejoice in.

It would be impossible to point more truly the elements of curiosity, of surprise, of satisfaction, which enter into the list of garden pleasures. Hawthorne touches upon another, too; that which comes from studying the characters of separate plants. "Summer squashes are a very pleasant vegetable to be acquainted with," he says. Who has not felt the same in watching the growth of a vegetable marrow? The joy in beholding the first asparagus push through the soil is one thing, the joy in noting the gradual softening of a peach or plum is another. The humours of a strawberry-bed are a comedy in themselves. Why one fruit should ripen while its next neighbour rots or remains inveterately white; why the same plant should contain giants and dwarfs, each apparently in the same stage of perfection, is a mystery. And everybody knows how past finding out are the vagaries of the rose-garden.

The pains of gardening come mostly under four heads—weather, weeds, insects, and gardeners. With 1879 in the memory of every one, it is not necessary to dwell on the first. Agricultural depression is generally regarded as the one result of last year's pretended summer; but there should be reckoned with it, and as perhaps equal to it, the mental and moral depression of the horticulturists. How many tempers were irretrievably soured last year will never be known, and once or twice during this present year the unhappy cultivator has feared that he might have another cruel time of it this summer. If he has, if the sun does not shine in August, and if the joys and sorrows that we have been speaking of are put into the scales of Zeus, the joys will kick the beam. Against rain that beats the roses to pieces and drowns the peas and rots the strawberries and floods the potato-drills, the most heavenly disposition may try to bear up in vain. "Quid labor aut benefacta juvant?" the hapless gardener may say. He may say much the same, too, in the face of the weeds of a very productive year, or in the face of the slugs that follow a mild winter, or of the gooseberry-caterpillars which this year have been swarming over his bushes. And if the "slightly unsatisfactory man" whom we have recommended as a stimulating helpmeet proves unsatisfactory in one special line, the master will be not less inclined to despair in this than in those other cases. Why gardeners should be so specially given to drinking fits is a physiological problem for which there may or may not be a solution; about the fact there can be no doubt. Still there are exceptions; and there are fine seasons when neither weeds nor insect-pests have been able to "lord it over the fields." In such cases the happy owner of the single acre is apt to think that the pleasures of a garden are much in excess of its pains, and to confess with Evelyn that "he is foolishly fond of these rustications."

NAVAL ACCOUNTS.

WHATEVER the faults of the Admiralty may be, it certainly cannot be charged with leaving the taxpayer in ignorance of the manner in which his money is expended. In the annual return of dockyard and shipbuilding expenditure for the year 1878-79, which has just been published, Mr. R. G. C. Hamilton, the Accountant-General of the Navy, has attempted to improve on previous official statements by giving fuller information, and he hopes in future reports to improve yet more, and to leave nothing untold respecting expenditure. He says:—

> The alterations in the form of this Return, which were introduced last year, have this year been considerably extended; but, although in size a large reduction has been made, no point of importance has been omitted: on the contrary, as regards naval construction, additional information is afforded in regard to the nature of each vessel's armament, the tonnage added during the year, and the previous expenditure on construction, while the principles which have hitherto governed its form are not affected.
>
> In the preparation of this Return two cardinal points are kept in view; first, the establishment of a close and direct connexion between the expense accounts of the dockyards and the appropriation account of naval expenditure, thereby securing that all the money expended for labour and stores has been accounted for; and, secondly, the treatment of each dockyard, for purposes of account, as a separate establishment, in order to show the comparative cost of similar operations at different yards.

The matter, it seems, has not been free from difficulty, and a large amount of official labour has been required to elaborate the present system of stating the accounts. This was planned by two official Committees in 1865, and has since been improved in accordance with the views of the Select Committee on Admiralty Moneys and Accounts which held its sittings in 1868. There is here given the result of the work undertaken, with the object of making it practicable for Mr. Hamilton, and his staff to set forth an account of the kind described by him, and in the present return a tabular statement of the expenditure during eight years,

under the different votes of the Navy Estimates. Respecting it, Mr. Hamilton says:—"For labour and machinery, where cash payments are made for work and material, capable of direct charge to a distinct service—such as construction, or repair, or dockyard maintenance—it will be seen that an exact agreement can be and is made between the total amount of the vote as shown in the appropriation account and the total amount of dockyard expenditure brought to account under those heads. But in the case of stores a difficulty has to be met, in that the stores paid for in the year are for the most part purchased for delivery into store and not for any special service; consequently, stores used in any year are not necessarily identical with stores bought." The difficulty mentioned, however, has been partly overcome, and Mr. Hamilton thinks that it will be possible to get rid of it altogether by means of a system of valuation. Even, however, if it were entirely disposed of, the Accountant-General for the navy would not be satisfied. The statements in the return are, from his point of view, still insufficient, and do not tell the public nearly enough. "While," he says, "it is shown in one return the appropriation account—that the expenditure has or has not exceeded the votes for labour and materials; and, in another, that for this expenditure certain work has been performed, it is nowhere shown how far the work for which money was voted corresponds with the work on which money has been spent."

To this deficiency Mr. Hamilton has given serious attention, and he has already made a partial effort to remedy it, having drawn up a table in which he has tried to show how a comparison may be made between the programme which was given in the Navy Estimates for 1878-79 and the work actually done. In time he hopes to be able to make a thorough and minute comparison: and he gives a very broad hint that when he and his staff are able to accomplish this, it will be well to publish the Return of Naval Accounts earlier in the Session, before the Navy Estimates have been discussed.

While awaiting this state of things, which doubtless the Lords of the Admiralty will do all in their power to bring about, the public must be content with the rather tardy information which Mr. Hamilton is now able to give; and this, though, as has just been seen, it is far from satisfying him, is certainly not meagre or largely insufficient. Those who scan official documents are usually well pleased to discover official shortcomings; and to a good many readers probably the most interesting of the many tables in the return will be that above mentioned, in which Mr. Hamilton compares the promises and the performances of the Admiralty in 1878-79. The statement certainly shows serious shortcomings. To take armoured ships only, the total amount of tons' weight of hull to be built was, according to the programme, 8,568; but only 6,912 tons had been built, or rather, according to the official method of calculating, were assumed to have been built, at the end of the financial year. Out of thirteen armoured ships, eight were allowed to lag behind. Thus the *Agamemnon* was short in advance to completion by 405 tons, the *Ajax* by 516, the *Inflexible* by 211, the *Colossus* by 284, the *Conqueror* by 185, the *Majestic* by 160, the *Neptune* by 182, and the *Polyphemus* by 246. The other five armoured vessels—the *Belleisle*, *Dreadnought*, *Nelson*, *Northampton*, and *Superb*—were, it is true, advanced further towards completion than had been promised; but the total excess was very small when compared with the total deficiency. Not satisfied with giving these and other facts, Mr. Hamilton endeavours to show how far the total works at each dockyard were short of the estimated amount; and from the figures he gives it appears that Pembroke was proportionately the most behind, although, owing to the small amount of work done there, the actual deficiency was much smaller than the deficiencies at Chatham and Portsmouth, both of which were large in amount. On the whole, the failures of the Admiralty in 1878-79 were considerable, but they were not so great as the failures of other years, as Mr. Hamilton takes the trouble to show. He certainly is determined that all the shortcomings of the department to which he is attached shall be known, for he gives a tabular statement of the amount of work promised and the amount of work done during the ten years which ended March 31st, 1879. One of the worst of these years, so far as regarded broken pledges, was that immediately preceding 1878-79, when the shipbuilding at the dockyards was short by 2,188 tons. In 1876-77 the Admiralty almost kept their promises, the deficiency being a very trifling one, and in 1875-76 they did more than they promised; but in 1874-75 the deficiency was 2,870 tons, and in each of the two preceding years it exceeded 2,000 tons. In 1871-72, 1870-71, and 1869-70, there were deficiencies of 786 tons, 1,268 tons, and 127 tons respectively. With contract work, although there was excess in some years, there was large failure in others, and the total deficiency, though not so large as that shown in the dockyard work, is considerable. It is not happily necessary to assume that this constant failure to keep pledges has been due either to carelessness or to incompetence at the Admiralty. It seems rather to have been due to a pernicious custom of over-statement. Strange to say, it has long been the fixed practice to promise every year more work than can possibly be done. It is scarcely necessary to point out the evils of this practice, which makes it impossible to tell how far the Navy Estimates are to be taken as really representing the intentions of the Admiralty. Perhaps now that an official of high position has shown in the plainest manner possible how, during a series of years, there has been a constant failure to carry out undertakings, and intimates that in future he will state the precise extent to which the work done has fallen short of the work promised, those who frame the estimates may be a little less reckless in pledging the Admiralty, and may abandon the custom of shipbuilding on paper, which, though at times it may please the House of Commons, must in the end give rise to deep and perhaps exaggerated distrust.

In fairness, however, it should be said that there are some excuses for errors and shortcomings; and the principal of these is stated in a part of Mr. Hamilton's Report which deserves the most careful attention. New difficulties constantly assail the naval constructors of the present day, and new causes for expenditure constantly arise. The late First Lord of the Admiralty took just credit to himself for the manner in which ironclads were maintained under his directions, and Mr. Hamilton's Report shows how largely the expense of maintenance has increased of late. The public has been so often told of the durability of iron ships as compared with wooden ones, that it will learn with surprise that, after a comparatively short period, iron ships, and specially armoured ships, require extensive repairs. Mr. Hamilton says:—

> As regards the former [armoured ships], the cost of maintaining and repairing armoured vessels amounted in this year to 430,077*l*. It is to be observed that the expenditure under this head has, of late years, had a tendency to considerable development. If the decay of armoured ships has been gradual their repair has necessarily been costly. As an illustration, the repair of the *Northumberland* may be instanced, which will be found to have cost in the year 1878-9, simply for the replacement of machinery and the provision of new boilers, the sum of 39,543*l*., for the repair of the hull and rigging a further sum of 73,455*l*., while the total cost of the repair of this one vessel amounted during the year to 117,998*l*.

He goes on to give a table of the expenditure on maintenance and repair during the period of ten years ending in March 1879. As the principal figures cannot be given in a more condensed form than that in which he has arranged them, and as they are of very great interest, we reproduce them from his Report:—

YEARS.	ARMOURED SHIPS. £	UNARMOURED SHIPS. £	TOTAL. £
1869-70 ...	128,223 ...	496,996 ...	625,219
1870-71 ...	180,772 ...	489,056 ...	669,828
1871-72 ...	87,576 ...	413,798 ...	501,374
1872-73 ...	159,180 ...	411,033 ...	570,213
1873-74 ...	291,341 ...	533,160 ...	824,501
1874-75 ...	321,040 ...	705,144 ...	1,020,184
1875-76 ...	320,267 ...	676,301 ...	996,568
1876-77 ...	208,070 ...	638,474 ...	846,544
1877-78 ...	489,315 ...	596,279 ...	1,085,594
1878-79 ...	430,077 ...	650,219 ...	1,080,296

It will be seen that the cost of repair and maintenance during the period, though not regularly augmenting every year, was enormously greater during the second half of the decade than it was during the first; and the increase with regard to armoured ships is shown in an equally striking manner by a comparison which Mr. Hamilton institutes between the original cost of some of the ironclads and the cost of repairing them. Thus, quoting from a table given in the return, he shows that during ten years 156,195*l*. and 170,202*l*. were expended on the repairs of the *Agincourt* and *Northumberland*, which cost to build 483,000*l*. and 490,680*l*. respectively; that during seventeen years and a half 200,185*l*. were expended on the repairs of the *Warrior*, the cost of building which was 377,292*l*.; that in seven and a half years the repairs to the *Sultan* cost 89,302*l*., against an original cost of construction of 374,777*l*.; and that during ten years 159,077*l*. were spent on the repairs of the *Monarch*, against an original cost of construction of 371,415*l*. It is unnecessary to expatiate on these figures, which speak for themselves. Mr. Hamilton has certainly rendered good service in publishing them, for though the expense of constructing modern war-ships has long been recognized, the expense of maintaining them is not yet fully realized. Without any material increase in the sums voted, the Admiralty has found itself burdened with a large and unavoidable increase in expenditure. Mr. W. H. Smith, finding that he had not money enough to build and repair, preferred to repair. The present rulers apparently intend to build, and, it may be presumed, will leave the old ships to decay. It is almost too much to hope that any First Lord will, for some time to come, have the courage to tell Parliament that, as the cost of the navy has greatly increased, there must be a large increase in the sum voted for the navy; but, if such intrepid truthfulness is not as yet to be expected, it is at all events well that statements should be published which will serve to familiarize the public mind with facts which, disagreeable as they are, must sooner or later be taken into account. Very valuable, then, is Mr. Hamilton's Report. He shows no disposition to slur over official shortcomings; but, on the contrary, states them in the most uncompromising manner; and, at the same time, he incidentally shows that there is some excuse for the officials, and that, without increased means, they have had to meet increased demands. It is for the public to draw the necessary and obvious inference from this, the most important part of his return. A large amount of valuable information relating to other matters is contained in it, but, owing to want of space, we cannot at present analyse this.

THE REPUBLICAN FÊTE IN A FRENCH COUNTRY TOWN.

WHILE in Paris M. Grévy was issuing new flags to the army with much applause of all men, and a joy that needed no official prompting was supreme throughout the city, the provinces, too, were celebrating the feast of the Republic in their own fashion. And a very odd fashion it was in some places, at least to the apprehension of the cold-blooded foreign observer who happened to find himself in a small town where the Sous-Préfet was the only known Republican. There is at present no reasonable doubt that France, as a whole, is Republican; that is, the majority of sober-minded and reasonable Frenchmen accept the Republic as the form of Government that is most likely to secure them peace and dignity abroad and order and prosperity at home. But the whole is not made up of homogeneous parts. The discontented minority does not consist of minorities distributed with approximate evenness through the towns and departments of France; but of particular populations, groups, and cliques which are concentrated in particular places to the extent of pretty well engrossing them. This is partly because the causes of material discontent and the sentimental traditions of anti-Republicanism run in local grooves, partly because the members of a thoroughly beaten and, in its own eyes, an oppressed minority naturally gather together to make up by compactness for their want of numbers, and comfort one another with talking of their grievances. Thus a state of things becomes possible such as was witnessed last week in a town not a hundred miles from Paris, which we shall call Bouzy-le-Têtu. The men of Bouzy-le-Têtu are well to do in this world's goods; fame says that some of them, though they live like any other provincial tradesmen and farmers, are immensely rich; and they are as little worried by the Government as any Frenchmen can be. Yet so it is that they are not happy to live under the Republic; and the Sous-Préfet is, as aforesaid, the only Republican in the place. Their anti-Republicanism is rather passive than active; nor is its precise complexion likely ever to be known, seeing that the principal inhabitants mostly live shut up in their own houses, and see nothing even of one another except when they give their daughters in marriage and pay off the accumulated social dues of a couple of generations. Therefore we shall avoid political conjectures, which in this case would be doubly precarious, and confine ourselves to relating plain facts.

Any stray tourist who has by chance made his way to Bouzy-le-Têtu will probably say of it that it is a desolate town, with many mills and few people in it; dull with the infinite dulness of French provincial towns; sad with the unfathomable sadness of a long white street, composed of private houses, "pale beyond name and number," but guiltless of being "crowned with calm leaves," or any green thing whatsoever. Such an one has seen the surface only of things, and knows not the fury of political passion, the depth of religious feeling, of which the Bouzinois are capable. He should have been at Bouzy-le-Têtu on the 13th of July, and beheld the proclamation of the Mayor, and heard the japes told concerning it by the inhabitants. It was indeed a remarkable document. It announced first that salvos of artillery would usher in the fête, then that the Sapeurs-Pompiers and the municipal band would execute a "retraite aux flambeaux" on the evening of the 13th, and lastly the Mayor hoped that in this solemn circumstance the inhabitants would display their liberal and patriotic sentiments.

Accordingly, on the evening of the 13th, we watched for any manifestations of patriotic sentiment that might appear. But, beyond a few small boys letting off squibs, nothing unusual was to be seen. We had well-nigh given up all hope, when a sound of drums and music burst upon our ears. Suddenly the principal hotel was illuminated with Bengal-fire, and the municipal band appeared, accompanied by a few evil-looking young men singing the "Chant du départ" and waving torches. At the same moment all the shutters in the street were closed, and the "retraite aux flambeaux" passed by, nothing daunted by its extremely cold reception. "But to-morrow it will be very different," said an enthusiastic young woman, and, on this assurance, we retired to prepare for the fatigue and excitement of the 14th. There are few prettier sights to be seen anywhere than that of the Promenade du Port at Bouzy-le-Têtu on a hot day. The wide avenues of trees ensure perfect protection from the sun, and the fresh grass and the pleasant sound of water are deliciously suggestive of coolness. If you follow the stream, you come upon a thousand unexpected beauties, picturesque little corners with mill-wheels turning under their sheds, surrounded by willows; and here and there a short street of washhouses overhanging the stream, and reminding one much of some of the small canals in Venice. It is, therefore, not surprising that when we were told that "a solemn feast" would be held on the Promenade du Port, we should have looked forward to it with pleasure, thinking that even the mildest demonstration of national sentiments would be pleasant to witness amidst such surroundings. In the morning the programme of the "solemn feast" was made known. The Sapeurs-Pompiers, to the number of eighty, were to assemble at the Mairie, and to march thence to the Promenade, where the Sous-Préfet was to review them; after which there were to be general rejoicings, and all the cafés were to remain open all night. Soon after midday the town, quiet with the quietness of death, was disturbed by a hideous clatter. Imagine the dog in Hans Andersen who had eyes as large as round towers dragging after him a cauldron of proportionate size, and one can form some notion of the monstrous noise that made all the windows shake. This, we thought, will be a feast indeed, seeing that the prelude to it is so tremendous. Slowly the cause of all this tumult came in sight—one Sapeur-Pompier, of vast size, wearing a plume nearly as tall as himself, and beating a drum with a fury that was terrible to witness. There was a kind of unwholesome energy about the man that made him far from pleasant to look at, so that it was a relief to hasten down to the "Place de la Mairie" to see his comrades assemble for the review. Arrived at the "Place" we found some twenty Sapeurs, of all sorts and sizes, armed with obsolete rifles of a preposterous length, loafing about and occasionally darting into wine-shops. By degrees some fifty or sixty rank and file were got together, mainly owing to the exertions of the superior officer, a thick-set, stupid-looking man, with a spluttering utterance. All this time the crowd, about two hundred strong, amused itself by "chaffing" the men to its heart's content. "How rejoicing it is," said a fat miller standing near us, "to see such fine men, barrels of liquor, unfathomable abysses of red wine, gourds upon legs who will stand any strain without bursting." "Mais regardez," said another answering him, "celui-là qui est ja-présent" (for they still say *ja* in these parts); "oh! il est plein celui-là, il est archi-plein." Before we could catch a glimpse of the man who was "full," a diversion was made by the arrival of the band, with a sand-blind old man at its head bearing the big drum on his back, while a stalwart ruffian pounded it from behind, despite the remonstrances of the on-lookers, who entreated him to forbear by reason of the drum-bearer's exceeding age. And now the gates of the Mairie swung open and the Sous-Préfet came out attended by the Municipal Council. A gun was fired, and all was ready for the start; but still the procession hung back, while scouts were sent out as if in quest of some missing object. At last they returned, bearing with them an old Pompier, who had completely fuddled himself with much drinking, and whose advent was greeted by ironical cheers. "Enfin!" said the commanding officer, and the procession moved off.

On the Promenade du Port the review began. It consisted in the Sous-Préfet walking slowly round the Sapeurs and then making a halt in the midst of them. "Silence!" cried two gendarmes who were in attendance, and the Sous-Préfet tried to look majestic. He, too, like the drum-bearer, was very old, and he was going to deliver his "discours." "Mes braves Sapeurs-Pompiers," he began in quavering tones, "I am going to talk to you about the Bastille." And in the midst of the most profound indifference he began a speech which was a miracle of grotesque dulness. At its conclusion one of his hearers cried "Vive la République!" but his immediate neighbours stamped on his toes till he screamed with pain. And now occurred a most painful incident. To cover the general apathy, the bandmaster ordered the drum to beat, whereupon the chief drummer struck, utterly refusing to go on unless he were paid extra for it. "Ce n'est pas dans le programme," shouted the drummer. The bandmaster raged, and the gendarmes were summoned to pour oil upon the troubled waters. In the midst of the disturbance the crowd moved off in another direction, and we followed to see if haply the "feast" might be more joyously celebrated elsewhere. Mounting the main street we came upon four posts, bearing the legend "Place de la Bastille"; in the middle of the street was a dingy erection like the funnel of a steamer, surmounted by a gilded cardboard man with wings, bearing a torch in one hand and a chain in the other. Further on were more posts with inscriptions, "Place de la République," and a bust surrounded with flower-pots. Here came the Pompiers to present arms amidst a great beating of drums, and then they plunged into the nearest *auberge*, and no sound was heard save the chinking of glasses. Nothing now remained to be done till nightfall, when the town was to be illuminated. All the private houses remained shut up, although the inhabitants were within, and what little display there was was due to the shopkeepers and aubergistes. Being told that at nine o'clock there would be a "ceremony" on the "Place de la Bastille," we went to look upon it. A few gaping women and children stood about, while a man hung lanterns on the hands and the tips of the wings of the gilded man; and a priest looked on with a sardonic smile. At ten o'clock the customary stillness fell upon the town, and, in spite of the Mayor's permission, some of the cafés began to close. "Voyez-vous," said a man in the street to his companion, "dans ce pays on n'aime pas beaucoup la République." And indeed it seemed like it.

DR. TANNER'S FAST.

THERE is nothing original in the sickening exhibition of a fasting man which is offered to an intelligent public in New York. This form of advertisement, and this attempt to gain notoriety by going without food, has long been practised by Welsh and other "fasting girls." Dr. Tanner has taken it into his head to starve in public for forty days, and the "irregular," "eclectic," "homœopathic" physicians and other queer people have encouraged the experiment. The American papers are full of the affair, but they seem to give no account of the Doctor's motives. Does he wish to illustrate the force of the will? An interesting baronet in one of Mr. Bret Harte's burlesques is said to have no lungs, and to go on breathing merely by the exertion of his will. Perhaps Dr. Tanner has some theory of this sort, in addition to such more obvious motives as we have already indicated. In any case, the "experiment" he is making seems absolutely without value for the purposes of science.

"Eclectic" and "irregular" physicians watched him during the first ten or twelve days of his task, and "eclectic" physicians seem inclined to welcome, and even to aid and abet, any performance which appears to be contrary to the ascertained laws of nature. They would like to demonstrate that the world is square and flat, that the moon is made of green cheese, or any other absurdity that might seem to invalidate regular science, and so to make room for their own irregular pretensions. This is the theory, at least, of a "regular" physician, a Dr. Hammond, who has been "interviewed" by an enterprising reporter. Said Dr. Hammond, "the conditions of the fast are not such as to guard effectively against deception. The gentlemen who are watching are all anxious that the patient should succeed, and are prejudiced in his favour." "You don't mean to suggest," said the reporter, "that those watching him would assist him in any way whatever in accomplishing his task." "Well," said Dr. Hammond, "I take it this way. The physicians watching him regularly are eclectics or homœopaths, and if to the world Dr. Tanner accomplished his feat, it would be such a triumph for them against the regular school that the temptation to assist would be so great that many an honest man would be tempted to give him some assistance. I also assert that the present conditions are such as to make the experiment of no scientific value whatever." We entirely agree with Dr. Hammond's theory of eclectic honesty. In the course of the first fortnight of starvation a Dr. Bradley declared that he saw one Johnson hand something surreptitiously to Tanner. There was a row, the lie was given, Bradley and Johnson wanted to fight with their fists. Affidavits were made in every direction, but the affair was inconclusive, and the fasting and watching went on as before.

The "experiment" is conducted with circumstances of ridiculous vulgarity. We confess that we have scarcely the heart to laugh at the absurd details. A man is either practising a coarse imposture in the midst of a crowd of silly busybodies, or he is being permitted to commit public suicide amidst the gabble of competitive quacks. "Suppose the man suddenly collapses," said a reporter to one of the "doctors"; "will there be any chance of saving his life?" "We don't intend to let him commit suicide under our eyes," was the answer, as if a throng of rival nostrum-mongers could possibly agree to take any steps that would save the wretched Tanner. "Of course if we can't get the proper remedies down his throat he will die," said the physician; "but in that event I hardly think that his watchers can be held responsible." Perhaps they cannot, and probably they have no conscientious scruples about aiding and abetting self-murder, as long as the law does not touch them. The popular interest in this affair is of the same morbid sort as that which fills the Agricultural Hall with a crowd eager to watch the agonies of men who have been walking night and day for a week. The pain, the fever, the "pluck" of the victims are found pleasant to watch, especially in the absence of the not more degrading sports of the Roman circus. Whether Dr. Tanner lives or dies, we may expect fasting matches to become popular. Men will fast against time, like Dr. Tanner, or against each other. There will be umpires, referees, bets, and stakes. Indeed, the Dr. Hammond already spoken of has been hinting at the terms of a new match—Dr. Tanner to fast for thirty days, watched by regular physicians—stakes, 1,000 dollars.

The conditions under which Dr. Tanner fasts at present are sufficiently comfortable, except for the crowd of silly or semi-intoxicated people who thrust themselves into his presence. As gate-money is only twenty-five cents, the poorest sportsman can come and study the symptoms of starvation. "Clarendon Hall is particularly well arranged for an affair of this kind," says the reporter, as if voluntary starvation were the most ordinary affair in the world. The room is lofty; there are plenty of open windows and "innumerable doors," so that Clarendon Hall is, in more ways than one, suited to an affair like Dr. Tanner's. The Doctor lies on a little bed, which was sent him by an enterprising upholsterer. "Give this man a good notice," the Doctor cried to the reporter, when the bed was sent in. He had a kindly feeling for a brother in the art of advertisement. The Doctor's bed is set within an enclosure of about forty feet square. When his pulse is examined he is called to the railing, and stands there till the examination is over. His bed is searched every morning, and so are the newspapers, of which he receives many. About the tenth night of his fast his face was very ghastly, and he staggered in his walk, while his pulse could not be detected at the wrist. "Wouldn't you go for a good beef-steak if you saw one?" a stranger considerately inquired. "No," said the Doctor; "the first thing I'll go for when I'm through with this fasting will be for a bully good old water-melon." "Some of the papers say you'll be going for your coffin soon." "Let them say what they like," replied the Doctor; "I am getting along splendidly." This burst of spirits seemed to tire the Doctor.

The Doctor's principal pleasures are driving—for we presume the papers mean driving when they say "riding"—and listening to music. He drinks a good deal of water, and he has wet towels put on his head, like the pale student of fiction. We do not gather that he smokes. Sometimes he runs upstairs, but these "exhibition spurts" tire him a good deal. He grows very irritable as time goes on; nor is this surprising, for most persons are irritable when kept waiting for dinner twenty minutes, not to speak of forty days. The public are gratified by the indubitable signs that he is "suffering intensely from the unnatural strain to which he has subjected himself in the interests of science." We have already expressed our belief that science has nothing to do with the matter, and that bull-fights and bear-baiting have quite as much right to claim the protection of science. One might well parody a famous saying and exclaim, "Oh science, what things are done in thy name!" The ninety cats and thirty dogs lately roasted alive in the holy cause of physiology are victims enough, and science can disclaim the human sacrifice which, if deception is out of the question, is being offered up in Clarendon Hall. About a week ago the poor wretch who is exhibiting himself had "passed through a woful change in appearance. His eyes are sunk deep in their sockets, and added to their sleepy depression is a bright glitter, which is terrible to look at. The man is not delirious, and no symptoms of insanity have yet been noticed by the physicians, but a timid person would scarcely care to be shut up with that glittering eye for company." Nearly a fortnight has passed since these words were written, and "regular" physicians only gave Dr. Tanner two or three days to live. The latest telegrams which we have seen reported him to be still alive, and it is horrible to think of the self-imposed tortures which he must have endured in the interval. Ten days ago he was "obviously near his death." After he began drinking water freely his health improved, till the depressingly damp and hot weather began. Such weather makes people feel exhausted who do their best not to starve themselves, and it produced the same effect on Dr. Tanner. He has still a fortnight between himself and the "bully water-melon" of his desires. As he has already lived after he ought to be dead, there seems no particular reason why he should die. Indeed, as he has got into the habit of living without food, he need not revert at all to the ordinary conditions of humanity. Though it is impossible to speak with certainty about his physiological condition, his psychological state must be interesting. If he is a common fanatic, with a dash of religious madness, he probably started in as good faith as is possible to a fanatic. Perhaps he half believed in the possibility of a miracle, and a little in some theory of the self-supporting power of the will. He may have been dimly conscious of an idea that collusion was not out of the chapter of accidents. If he knew anything of the history of similar "experiments," he would have been aware that science could derive little more real information from his case than from that of Louise Lateau. If he survives, he may, not improbably, found one of the odd ascetic sects which are common in America and in Russia. Or he has a profession open to him in Hindostan, if he likes to run counter to British law. He may "fast on" recalcitrant debtors; that is, sit starving at their doors till they pay what they owe, lest he should die, and his death be on their heads. We would willingly pay a small bill, even for the second time, if Dr. Tanner would only eat his water-melon. If this feeling were general, the tender-hearted citizens of New York would subscribe large sums to induce the Doctor to make a "square meal." But the citizens have not thought of interfering in this manner with his task. Whether he succeeds or fails, he is sure to have imitators, so crazy is the modern hunger and thirst for notoriety. Perhaps it may be found necessary to pass a law which will check the suicidal mania which first showed itself in long-distance walking races, and which has now assumed an even more repulsive aspect. To lynch a few irregular and eclectic physicians would be illegal, but natural.

METROPOLITAN BANK DIVIDENDS.

WITH but one important exception, the London joint-stock banks and discount Companies have now declared their dividends for the past half-year, and have also published their reports; most of them likewise have held their general meetings. We can therefore compare the results of their working during the six months with the results of the corresponding period of last year, and thus apply a crucial test to the statements made respecting the improvement in trade. We say a crucial test, because the peculiarity of banking business, and likewise of that done by discount houses, is that its profits are made, partly, no doubt, by judicious investment, but chiefly by supplying others with the funds by which they carry on their operations. Banks and discount houses, therefore, prosper on the general prosperity of the community. There are times, it is true, when the value of money is very high and the community can hardly be said to be prosperous, but when banks do very well. But these are exceptional times, very different from the past half-year; and, notwithstanding them, our proposition is true as a general statement. It is especially true of half-years like that just ended, when the value of money was not high. Although the official minimum rate of discount of the Bank of England was uniformly 3 per cent., save for the last fortnight of the half-year, the open market rate was almost always much lower, and was often, indeed, below 2 per cent. During the six months, therefore, the value of money was low, quite as low perhaps on an average as during the six months with which our comparison is made. For if the open market rate was lower towards the end of the first half of 1879, it was much higher in the beginning. Consequently, if the banks and discount houses, taken as a body, did better in the past half-year, it must have been because they were able to employ their disposable funds more continuously, and suffered less loss from bad debts. Let us see, then, what has been the result of the past six months' working; and first let us examine the dividends declared. We find that of nine banks seven have declared the same dividend as twelve months ago, and two have declared better dividends.

Of these two, the greatest of all—the London and Westminster—has divided its profits at the rate of 16 per cent. per annum, against 14 per cent. per annum twelve months ago, being an increase of 2 per cent. per annum. Of the second, the Union of London, also one of the greatest, the dividend is now at the rate of 15 per cent. per annum against 12½ per cent. at this time last year, showing an increase of 2½ per cent. per annum. The Joint-Stock Bank's dividend is unchanged, and that of the London and County is not yet declared as we write. Of the three great London joint-stock banks which have already declared dividends, that is, two have been able to divide 2 per cent. or more over the rate of twelve months ago. The smaller banks declare the same rate. Of the three discount Companies two, the National Discount and the United Discount, have each increased their rate of dividend by 1 per cent.; the third has made no change. Thus, of the twelve Companies four have increased their rate of dividend, and not one has diminished it. We find from the reports, moreover, that of the banks which have not increased their dividends, the Alliance, the Imperial, the Central, and the South-Western augmented their profits by an aggregate sum of 15,405*l.*, while the decrease in the case of the London Joint-Stock and the Consolidated aggregated only 487*l.*; so that the additional earnings of these six banks, which did not increase their dividends, were just 15,000*l.* It follows that the six months just ended were very much more profitable to bankers as compared with the first half of 1879, than would appear from the mere increase in certain of the dividends declared. Taken as a body, the joint-stock banks and the discount Companies all did better, and what is true of them is no doubt true also of the private banks and the private bill-brokers.

We have stated above why this was so. In the first half of 1879 the shock of the Glasgow failure was still recent, and credit in consequence was paralysed. Bankers did not know whom they might trust. There were rumours afloat that this house and that had received a blow from which it could not recover; and even when these rumours were doubted, they had their effect in making bankers cautious. Nor was it mere suspicion and alarm alone which produced this state of distrust. All the great industries of the country were in collapse. The iron, coal, and cotton trades, for instance, had been prostrate for years. Prices had fallen to a lower level than had previously been experienced in the present generation; wages were cut down until all the rise of the previous good times disappeared; and still stocks accumulated and works were stopped. It was naturally argued by bankers that this could not go on for ever; that, though failures had been singularly few, losses must have been ruinously heavy, and consequently that some day a general crash must come. But all this discredit was dispelled in the autumn. The United States began buying iron on an immense scale, and properties which a few months before had been unsaleable and unworkable became highly valuable. Prices were doubled in a short time, the accumulated stocks of years were shipped across the Atlantic, mines were reopened, furnaces were blown in, mills were set going. Of course, additional accommodation was required from the banks to enable all this to be done, and it was readily given when the security offered was thus so much increased in value. Simultaneously with this genuine improvement of business due to foreign buying there instantly set in an access of speculation. That was inevitable. The improvement in trade brought in its train increased traffic for the railways, which meant better dividends, and consequently enhanced value. So, again, the demand for accommodation from the banks signified larger profits for them and an improved position. All this was clearly perceived by the acuter speculators, and led to the movement which was witnessed. But the outburst of speculation in its turn increased the business of the banks, inasmuch as speculators generally carry on their operations only by means of bankers' advances. Thus the cause why the banks have been able to earn larger profits in the past half-year than in the corresponding period of 1879 is that credit is better now than it was then, and consequently that bankers have been able to employ their resources more freely. The value of money, nevertheless, was very low during the six months. But the increased turnover of course swelled profits, while fewer bad debts diminished losses.

It would be out of place here to analyse the balance-sheets of the several banks, with the view of testing the correctness of the statements just made, nor would it indeed be worth while to do so. The balance-sheets are made up on the last day of the half-year, and they show therefore only the state of the banks' accounts on that particular day. But it is notoriously the practice of the joint-stock banks to accumulate an exceptionally large amount of cash in their own hands, at the Bank of England, and at call, at the close of the half-year, so as to give the impression that their accounts are more "liquid" than they really are—that is to say, that they hold a larger cash reserve. For this reason the balance-sheets are misleading, if we regard them as samples of the run of business during the six months. Naturally it is the bills and advances which are decreased when cash is accumulated. The permanent investments in Consols, Indian Stock, Railway Debentures, and the like, would not be disturbed, unless it had been decided for other reasons to sell out of certain securities. But the advances would be called in with full assurance that the money could be lent out again with ease on equally favourable terms. So, likewise, bills would be allowed to run off, and except for customers, difficulties would be made about discounting afresh. In the balance-sheets, therefore, the permanent investments bear generally an exceptionally huge proportion to the discounts and advances. But, if we compare one balance-sheet with another, it may be thought that we may fairly assume that the accumulation of cash has been effected in the same way on the occasion of the making up of each. This does not appear to be so, however, as may be seen if we examine the balance-sheets for June of this year and June of last year in the case both of the London Joint-Stock and the Union of London—banks so similarly circumstanced that one refuses to limit liability because the other does. The Union has increased its dividend 2½ per cent.; yet it has decreased its discounts 1,377,000*l.*, and its advances 69,000*l.*; while it has increased its permanent investments 389,000*l.*, and its cash 1,131,000*l.* It is quite clear that it did not increase its dividend by augmenting the cash in hand and at call. The Joint-Stock, on the other hand, has earned only the same dividend as twelve months ago; yet it also has increased its cash in hand, and likewise its discounts, loans, other securities, and money at call, which it lumps all together. It seems clearly to follow that the practice in the two years has not been the same. But the explanation we have given above of the superior profitableness of the past half-year is confirmed by the speech of the Chairman of the London and Westminster Bank at the meeting on Wednesday.

Before concluding, we must express regret that the discussion of the past two years has borne so little fruit in the way of improving the form of balance-sheet in several important instances. Incidentally, we have just now referred to the fact that the London Joint-Stock, one of the five principal Metropolitan banks, lumps together its bills discounted, loans, other securities, and money at call; and the London and Westminster is nearly, though not quite, as bad. It enters as a separate item the money at call and short notice, distinguishing also separately the cash in hand and in the Bank of England. This is as it should be, and sets an example which, it is to be wished, the London Joint-Stock would follow. But the London and Westminster, on the other hand, confounds the discounts, loans, and other securities. It is quite evident that an entry such as this conveys no information to the shareholders and customers of the bank, which the balance-sheet is supposed to be intended to do. What are other securities distinct from bills discounted and loans, and distinct likewise from the securities of the Imperial Government, India, and the United States, and from liabilities of customers for acceptances and for endorsement, all which are entered separately? If the phrase is tautological, why is it maintained? If it represents anything valuable, why is it not explained? Again, how much of the 12 millions and odd is invested in these other securities, how much is advanced as loans, and how much is employed in discounting bills? When so many questions—and they might be multiplied—are suggested by an entry and left unanswered, it is quite clear that the entry is worse than useless. Sir Stafford Northcote's Bill for the limitation of liability, as originally introduced, contained a form of balance-sheet which would have imposed upon bankers the obligation to give detailed information on these points; but unfortunately the balance-sheet was dropped for the sake of hurrying the Bill through. Yet we had hoped that bankers would see the advisability of giving the information demanded. It is to be regretted that so great an institution as the London and Westminster, which has been enlightened enough to take advantage of the Act for limiting liability, should encourage by its example a bad practice, which it has no motive but the force of routine for keeping up.

THE OPERA SEASON.

THE most captious of critics must at least confess that Signor Arrigo Boito's *Mefistofele* is a decided success. Like many other works of art condemned at first, it has in due time proved itself a production of the highest qualities, and Mr. Mapleson may justly congratulate himself upon having added another great opera to his répertoire. To us it is not at all surprising that such a work should have been at first uninteresting and misunderstood. That a hitherto almost unknown composer and, as Signor Boito has shown himself, a poet should begin his career by writing an opera on so well worn a subject as Goethe's *Faust*, to say nothing of his entering the lists with so famous a man as M. Gounod, was a bold stroke indeed. At first sight it would seem rash, not to say impertinent, in the eyes of the majority of the public to attempt to give a new rendering of the subject which had been already so ably treated. The comparison between Boito's *Mefistofele* and Gounod's *Faust* was inevitable; and besides it was first produced in Milan, where so great a departure as this opera is from the acknowledged tradition of Italian operas was sure to meet with censure. After the success of *Lohengrin* at Bologna, however, *Mefistofele* was hailed as a proof that Italy also had broken the bonds of conventionalism, and could produce a genius worthy of the nation. We do not intend by this to compare Signor Boito's work to that of Herr Wagner, for in no single important particular can it be said that there is any likeness. Undoubtedly it is the fashion to attribute any originality of treatment in a musical work of the present day to the influence of Herr Wagner, and indeed "Wagner influence" has become one of those cant terms which are convenient to hide a want of knowledge or appreciation. To say that Signor Boito is unacquainted with Herr Wagner's method would be to accuse

him of strange ignorance; but, at the same time, to say that he is in any great degree influenced by Wagner's example is equally ungenerous. There is one point in which the two composers are at one, and that is that, both being poets, they write their own libretti, and consequently the music is wedded to the words. In this Signor Boito has shown how true the German maestro's so-called theory has proved in practice. At the first hearing we were struck with the originality and artistic power of the new opera, and a second has confirmed us in our opinion that it deserves to take its place in the front rank, and we feel sure now that we are not singular in this opinion. The most thoughtful portion of the work, and to our mind the most original, suffered from two causes, one avoidable, the other perhaps not so. We mean the Prologue in Heaven. In the first place, the chorus was hopelessly incapable of singing the music, and in the second the arrangement had necessarily to be altered. The consequence was that one of the most poetical parts of the opera, both as regards words and music, became at times almost tedious. The Kermesse scene which followed is truer to nature than the now celebrated one in Gounod's *Faust*, as far as the music is concerned. There is a roughness about the choruses much more indicative of German life than anything found in those of M. Gounod, and the whole of the music at Faust's appearance is effective and impressive. The study scene in the opera comes where it should—namely, after Faust has met Mefistofele, the grey friar, whose entrance is in the real spirit of Goethe's great poem. Had this opera been produced at Covent Garden instead of Her Majesty's, we should doubtless have been treated to as outrageous a pantomimic effect when Mefistofele takes Faust off upon his mantle, as is employed in the first act of Gounod's *Faust* at Covent Garden when the study disappears; and Mr. Mapleson may be congratulated on having withstood the temptation to which Signor Tagliafico has for many seasons so unwisely succumbed.

Mefistofele's song in this scene, with the daring and effective refrain of a whistle to which we have on a former occasion referred, is highly to be praised, and Signor Nannetti sings it with great effect. The garden scene is in some ways a new reading. Signor Boito's Margaret is far more sprightly than even Goethe's, perhaps a pardonable change when the subject is treated from an Italian point of view. The whole of the music of this scene is evidently written with a view of leading up to the beautiful quartet with which it closes. Out of the simplest material Signor Boito has constructed one of the most strikingly dramatic portions of the opera, and has compressed into a few bars that which would have taken many another artist whole pages to express. Faust's passionate longing, Margaret's half-unwilling assent, and Mefistofele's and Marta's mock love-making, are all combined in this quartet. The music of the Brocken scene containing Mefistofele's weird "Ballata del Mondo," and the unearthly chorus in which the devils worship their master, is at once masterly and original, and the "*Fuga infernale*" is indeed rightly so named. Margaret's soliloquy in the prison is somewhat too Italian in feeling as far as the music is concerned, a point which Mme. Nilsson, with commendable modesty, did her best to conceal. A not very original piece of *fioritura* sung by one who is about to die is not in the best taste, and we were grateful to the prima donna who completely ignored it. Were it not for the music, the second part might well be dispensed with; but the delicate duet between Helena and Pantalis, and the graceful ballet music, make up for all other faults, and the strongly contrasted passages of the Epilogue bring the opera to a natural close.

We should have hardly thought it possible for Mme. Nilsson to have created a second Margaret; but so it is, and this great artist has won fresh laurels in her impersonation of the character. Her acting in the quartet in the garden scene is as unequalled as it is effective, and her distress in the prison is heart-breaking. To the admirable acting and singing of those who took part in the opera is doubtless due to a great extent the success which Signor Boito has achieved with his opera, and we have seldom seen better scenic effects than those produced at Her Majesty's. The weak part of the performance was due to the chorus, which might be reorganized with great benefit to all concerned. Signor Nannetti's Mefistofele was, as before, admirable; Signor Campanini distinguished himself as Faust; and Mme. Trebelli sustained what in other hands might seem the minor parts of Marta and Pantalis as no other singer could sustain them. Signor Arditi conducted.

Last Saturday the season at the Royal Italian Opera came to an end, and this evening that at Her Majesty's closes. If we look back on the doings of the past season we shall not, we fear, find much matter for rejoicing. At Covent Garden the novelties, if such they can be called, consisted in the revival of *Mignon*, and the presentation of two operettas which were expanded to suit the exigencies of the Royal Italian Opera stage, and which of course lost proportionately in refinement and interest. Why the *Pré aux Clercs* and *Estella* should find a place in the répertoire of Covent Garden, whilst such works as *Der Freischütz* and *L'Etoile du Nord* are passed over, we are at a loss to understand. The only explanation that occurs to us is that perhaps the "stars" were not forthcoming for their performance, but the consequence is not the less disappointing to the opera-going public. We have learned two lessons this season with regard to Covent Garden, the first with reference to the "star" system, the second concerning novelties. That the "star" system is a complete failure as far as art is concerned we had almost hoped was an acknowledged fact; but, to our astonishment, it has been most rigidly adhered to this season at Covent Garden, with a fatuous earnestness. Mme. Albani, who bore the brunt of the earlier part of the season, was succeeded by Mme. Patti, with in each case no better support than could be given by Signori Gayarrè and Nicolini. It is true M. Lassalle and Mme. Sembrich were both allowed to "star" for a short time, but the former singer appeared only once or twice, and the latter sang the most uninteresting of parts. Whether this system is productive of good results to the management we are not anxious to inquire, but that it is most deleterious from an artistic point of view only makes itself more and more apparent to us. With regard to the second point, it is very clear that second-rate operas, which may even have achieved success on smaller stages, cannot be produced with a happy result at the Royal Italian Opera, and we sincerely trust that in future seasons we shall not be treated to any more such works as *Estella* and *Pré aux Clercs*. The great event this season at Covent Garden has been the advent of Mme. Sembrich, who, to a voice of marvellous flexibility and range, adds a considerable knowledge of acting, and we hope next year to see her in parts more worthy of her remarkable powers. This isolated instance, however, can hardly be said to constitute a successful season, and we are sorry not to be able to record any other events. At Her Majesty's, when the season had gone on for some time with nothing remarkable to speak of in the way of novelties, we were treated to *Lohengrin*, under the conductorship of Herr Richter, a fact which of itself would have marked the season of 1880 as not altogether uneventful. The novelties at this theatre consisted of the revival of the unfortunate *Forza del Destino* and the production of *Mefistofele*—the first a failure, and the last, as we have said before, a genuine success—and there is little doubt that the latter opera will become as popular as *Faust* and *Carmen*, the production of both of which is due to the enterprise of Mr. Mapleson. Mme. Eleonora Robinson's *début* in *Fidelio* at this theatre proved a success, and we hope we shall see her again next season; while that of Mme. Marie Louise Swift, although suffering from the choice of the opera in which she appeared—namely, the *Forza del Destino*—was in its way as successful as it could be. Mmes. Nilsson, Trebelli, and Gerster have sung this year to the satisfaction of the most fastidious; and Messrs. Candidus, Maas, and Ravelli have also been added to the staff; and Signor Nannetti has shown himself an artist of power by his creation of Mefistofele. We hope that the success of *Mefistofele* may encourage the management at the two operas to give the public a chance of hearing some of those operas which, while achieving success on the Continent, have as yet to be heard in London; and that the time is not far distant when another opera of Herr Wagner's, or the *Nerone* of Herr Rubinstein, may take an important place in their répertoires. At both houses this season the choruses have been almost disgraceful; and that of Her Majesty's Theatre went far to mar the otherwise perfect performance of *Lohengrin* under Herr Richter, which will be long remembered by those who were fortunate enough to hear it; whilst, as we have already said, the early part of *Mefistofele* was nearly ruined through the chorus's inefficiency. Whether this is from want of practice, or absolute incapability (we think a little of both), we would strongly recommend a more careful selection in this department, and venture to prophesy a proportionate success.

REVIEWS.

WARD'S SELECTIONS FROM THE ENGLISH POETS.*

So far as this work has gone, it seems likely to accomplish with deserved credit the aim put forward by the editor, that of being "an anthology which may adequately represent the vast and varied field of English poetry." The difficulty of making such a selection on perfectly consistent principles is illustrated by what is said in the very next page of the Preface. "We have not included the writings of living poets, nor the drama, properly so called. Had we admitted the drama, we should have been compelled to double our space." This is true, and, in a world where books are made to be sold and bought, not easily answerable. But one result is that it goes hard with the dramatists whose whole strength has been put into dramatic work. We actually have here a catalogue of Shakspeare's contemporaries in which there is no sign of Webster; and this, indeed, for no cause of downright necessity. Certainly Webster's minor poems do not offer much, if anything, that would show him to advantage. But surely the dirge from *Vittoria Corombona* might have found a place, were it but for the sake of Lamb's words concerning it. This leads us to another remark of wider bearing. If perfect consistency and symmetry of plan are not attainable in an anthology like this, it may be worth while to consider whether space cannot be gained by sacrificing a little more. We suppose that the sort of work intended to be made better known by these selections is twofold. First, there are the smaller gems of the great masters, which in their collected works are overshadowed, and apt to be neglected even if the collected works are read. Such are Shakspeare's sonnets and Ben Jonson's

* *The English Poets.* Selections, with Critical Introductions by various Writers, and a General Introduction by Matthew Arnold. Edited by Thomas Humphry Ward, M.A., &c. Vol. I. Chaucer to Donne. Vol. II. Ben Jonson to Dryden. London: Macmillan & Co. 1880.

epigrams. Then there are the poems of lesser men altogether, from which the selections will be, as the editor says, either specimens of the average work of men famous in their day, given as a matter of historical interest, "to explain why they were famous," or the occasional felicities of others "who wrote a few beautiful poems as it were by accident." And it seems to us that the second class, though less important in themselves, are in a book of selections relatively more important than the first. For these represent a part of English literature which readers who do not make a special study of English poetry cannot expect or be expected to know otherwise than by selections; whereas people who have Shakspeare and Milton in their hands, as every one has who reads at all, have merely their own laziness to blame if they do not know the Sonnets or *Comus*. Nevertheless this sort of laziness is rife even among men and women who pass for well read; and it may always be said in defence or mitigation of the wrong done to the great masters by pieces torn from their context that the sight of them stirs up fading memories, sharpens anew the taste that has become dulled, and sends the reader, suddenly made conscious of the wealth he omits to use, to take his pleasure in the book at large. Still it seems hard on the poor minor poets to be ever crowded and eclipsed by their betters, who after all have little to gain by it. We may talk of representing the greater poets, but in many cases the thing is not possible. Chaucer is not represented by scraps and cuttings from three or four of the *Canterbury Tales*, though the cuttings cover among them a good deal of room. Or, to take a very different case, Milton can perhaps be fairly represented by a selection. But for that very reason the selection is almost superfluous. Why must *Lycidas* be printed again and again, when it is barely credible that any one into whose hands the book may come will not know *Lycidas* already? Not that *Lycidas* can be printed or read too often; indeed the omission of it in such a collection as the *Golden Treasury*, meant to be a companion and friend, would be a fault beyond forgiveness. But Mr. Ward's book, even any one volume of it, is too large for a companion. It is a book of instruction and reference, not a store of delight to be taken when other books are left behind. On the whole, it seems to us that the thing really wanted was a good and scholarly selection, not so much of English poetry in general, as of the minor English poets, including, if it were thought fit, minor and less known work of the great poets; something that should do for English literature in a larger, more thorough, and more critical way what the old Eton *Poetæ Græci* did for Greek. This is not exactly what Mr. Ward has given us. At the same time his performance does come so near to this, though aiming at something else besides, that it would be no better than churlish pedantry not to be thankful for it.

Moreover there is a deep reason, if we listen to Mr. Matthew Arnold's argument in his ingenious Introduction, for the plan of a poetical collection here adopted. "The best poetry is what we want"; and here we are to get the best poetry, and other besides, that by seeing them together we may know how much better is the best than the next best, and may thenceforth surely discern the really best kind of work, the true classics, by a kind of practised intuition. Mr. Arnold warns us, justly and not without need, against confounding historical with absolute judgments in literature; and he advises us to use the best expressions of the great masters as "an infallible touchstone for detecting the presence or absence of high poetic quality, and also the degree of this quality, in all other poetry which we may place beside them." He illustrates his meaning by specimen lines—as well chosen, certainly, as they could be—from Homer, Dante, Shakspeare, and Milton. But is not Mr. Arnold a little too curious in this matter? nay, does he not even tremble on the verge of the deadly heresy of prescribing short cuts to critical certainty? These lines are to Mr. Arnold, or to any one who has studied the authors, compact symbols and memorials of their power. How can we tell what an "incomparable line and a half of Dante" would seem like to one who had never read the canto? or Hamlet's last words to Horatio to one who had never read the play, and did not know what it was about? Again, if we are to pick and choose lines, it would not be hard to set awkward puzzles for disciples confident in Mr. Arnold's touchstone. Take these two:—

> Enough of light is this for one life's span,
> That all men born are mortal, but not man.

Have these, or have they not, the high poetic quality, the high poetic truth and seriousness, which we are bidden by Mr. Arnold to seek? If the disciple denied it, we should, for our part, disagree with him. If he admitted it, we should reveal the passage in its context. It is the work of a living poet to whom we doubt if, taking his work all round, Mr. Arnold would readily allow "the possession of the very highest poetical quality." Mr. Arnold is privileged to play with epigrams and happy phrases till he almost makes us believe that his critical method is quite simple and obvious. But any confiding young person who thought to make himself a critic like Mr. Arnold by merely swallowing Mr. Arnold's touchstones would assuredly find himself mistaken.

We come now to the poems themselves, and in a general way there is little else to be said than that the right authors have been chosen to select from, the right kind of selections made, and the right kind of introduction and information provided to make the use of them profitable. The various editors naturally do not always agree. Thus Mr. Churton Collins writes of Wyatt and Surrey as having "purified our language from the Gallicisms of Chaucer and his followers," notwithstanding that, in the introduction to Chaucer himself, Mr. Ward has pointed out that the supposed Gallicism of Chaucer is a chimera. There are also traces now and then, as might be expected, of the over-pitched "historic estimate" of minor writers which has been the subject of Mr. Arnold's warning. We can hardly think that the specimens of the Scottish fabulist Henryson come up to the mark of the praise awarded him by his editor, Mr. Henley, or that Lodge quite justifies all that Mr. Gosse has to say of him. As a rule, however, the special introductions to the poets are good and discreet critical work. We may also call attention to Mr. A. Lang's introduction to the selection of ballads (where he laments the dulness and meanness of English ballad literature) and to Chapman, in whom he points out a certain Alexandrian quality of the artificial Elizabethan poetry. The modernized spelling of everything from the Renaissance downwards is a point on which sticklers for historical exactness may perhaps take offence; but on the whole we think Mr. Ward has used a sound discretion. There is really no middle course between the modern spelling and an exact reproduction of the original editions; and the chaos of English sixteenth-century spelling is more than the general public are yet prepared to encounter. Ancestors who could write *dyffynytyvyly* for the modern *definitively* (this form appears in an Act of Parliament of Henry VIII.) cannot complain much of posterity for finding their usage too troublesome to reproduce for ordinary purposes.

The second volume brings us down to Dryden; and in going through it one is comforted to find how just, on the whole, the judgments of the world have been; how well it has done in choosing those pieces of such writers as Carew, or Lovelace, or Waller which may be said still to live. Among the critical introductions there is to be noted the Rector of Lincoln's condensed essay on Milton; and Mr. Gosse's work is, as in the first volume, abundant, careful, and ingenious. He corrects neatly and with a light hand the commonplace comparison of Herrick to Catullus:—

> The successive editors of Herrick have noted what they conceive to be his likeness to Catullus, but this is hardly critical. The prominent qualities of Herrick's verse are not passion so much as sensuous reverie, not fire so much as light, not the music of the lyre so much as of the flute and fiddle. In all these respects he is far enough from resembling Catullus, but very near to Martial; who, moreover, alone among the Latin poets has that minute picturesqueness of detail and delight in the accessories of life which we admire in Herrick.

This on Waller, again, is very happily said:—"Waller's love verses, though frigid, are more manly than those of Cowley, and if they do not take the heart by storm, they beleaguer it with great strategic art, and an infinite show of patience." In the short notice of Sir William Davenant, doubtless full as long as it deserves, we do not find any reference to Hobbes's extraordinary panegyric on *Gondibert*, which is in its way one of the curiosities of English literature. Hobbes gravely says of a certain description of love in the seventh canto of the second book that "there has nothing been said of that subject, neither by the ancient nor modern poets, comparable to it"; and he pronounces the other incidental descriptions to be equal to Virgil's or Homer's. It is true that he is writing in answer to some complimentary remarks of Davenant's in the preface to his great epic.

An advertisement at the end of the first volume gives promise of a third and fourth to follow, dealing with the poets of the last and the present century, from Swift to Clough. We note with special interest that Rogers, Southey, and Campbell are to be undertaken by Sir Henry Taylor; and with some surprise that Blake's name does not appear in the list. Considering that Mr. Swinburne is already enlisted as editor of the selection from Collins, it should not be difficult to provide for specimens of Blake's poetry being worthily introduced. We cannot believe that it is intended to exclude Blake from a company to which Rogers and Praed are admitted. Blake of course abounds in obvious inequalities and crudities. But we know no other modern English poet of whom it can be said that he wrote a song capable of being taken for a piece of Shakspeare's early work.

INDIAN REMINISCENCES.*

COLONEL WHITE in his preface explains, for the information of "any one wishing to know why these reminiscences have been so long in making their appearance," that it would not have been advisable to publish them while he was still in the service, and also that he has been engaged in writing other works, the most important of which, "The History of the Reign of Charles I., the Commonwealth, and Protectorate of Oliver Cromwell," will soon be sent to press. He awaits the verdict of public opinion on this his first literary production, which he hopes will turn out useful and profitable in a religious point of view. The verdict of the public may perhaps be inferred from the following abstract of its contents. The author left England as a cadet in 1844, and on his voyage to India "became the butt" of the other passengers. This he would not have much minded; but

> to be incessantly the object of their practical jokes; to have salt put in my wine, and on one occasion even gunpowder inside a cigar I ventured to smoke till it exploded; to have hard peas propelled through a pea-shooter with stinging force against the different features of my face; to be tied fast to the ladder till they chose to release me, whenever I attempted

* *Indian Reminiscences*. By Colonel S. Dewé White, late Bengal Staff Corps. London: Allen & Co. 1880.

to mount aloft; to have my chair suddenly withdrawn the moment I was about to sit upon it, amidst the laughter at my fall to the ground—all this was enough to provoke to desperation one by nature hot tempered! It will, therefore, be easily understood that I led a dog's life on board ship, for not only were these games carried on during the day, but even at night they would not let me alone.

In this extract Colonel White artlessly paints himself. As was the cadet, so was the ensign, lieutenant, and captain. He appears from his own account to have gone through life, not given to laughter himself, but the subject of laughter in others; and to have had an extraordinary aptitude for getting into hot water.

On reaching India, Mr. White soon gained some experience of active service, his regiment forming part of the army which fought the first Sikh campaign, and we are indebted to this chance for some graphic biographical sketches of the distinguished military characters of the day. As for example:—

During that time I used often to see Sir Hugh Gough watching the enemy from the camp watch-tower, and a fine old gentleman he looked every inch of him. Highly honoured should I have felt had he condescended to have noticed a regimental subaltern like myself, by asking me the time of day or making an ordinary remark about the weather. But I never had the honour of a single word from the venerable veteran throughout the whole of this time. . . . It is remarkable how rank is worshipped in the army. A major or lieutenant-colonel, especially if he is in command of a regiment, is held in great admiration, awe, and respect, as if he were a king. And I know this, that I have stood in such fear and awe of the general that I felt it really a painful ordeal to pay my respects to the great man.

On this follows a beautiful moral reflection:—"To my mind there is scarcely anything sadder than to hear, as one is continually doing, of the passing away from earth of those who, during my Indian service, have acquired great renown in that Eastern clime, and as such have been the objects of my admiration." Persons who have been so fortunate as to be admired by Colonel White should apparently not be subject to the ordinary conditions of mortality. But "in this melancholy disorganization of human strength and greatness, how refreshing it is to fall back upon God's word, which assures us, 'There remaineth therefore a rest for the people of God' (Hebrews iv. 9)." These religious reflections are very thickly strewed throughout the book. As for example:—

What must any observant person think, when he thoughtfully reflects on the strikingly degraded moral condition of a naturally fine and intelligent race of people, held in subjection by the inhabitants of a Christian and very distant and comparatively small island. . . . I repeat the question, what must he think? Can he help arriving at the conviction, if he pursues these reflections to their legitimate issue, that in illustration of the text (Prov. xiv. 3, 4), "Righteousness exalteth a nation," England owes her elevation in the scale of nations to her pre-eminence as a Protestant country?

But unfortunately, although we are pre-eminently a Protestant nation, all our Indian officers are not so Godfearing as they should be, and Colonel White gives a graphic picture of the melancholy consequences of irreligion in the case of a brother officer who was eventually tried by court-martial; and then quaintly proceeds to describe how he himself was also tried by a similar tribunal. The difficulty arose out of a brother officer at target practice setting his squad to fire at the butts before Ensign White had got out of the way:—

Strange to say, this he did twice, and perhaps it would be not too much to say that I narrowly escaped with my life, as Sepoys used sometimes to fire very unsteadily. I was naturally filled with indignation at my life being thus wantonly jeopardised, but Mr. T—— excused himself by preferring a charge of dilatoriness against me, as if tardiness in counting the hits were a sufficient excuse for imperilling an officer's life! But the sacredness of human life, when I happened to be concerned, seems to have been rather an exceptional case, since, not long before this, when I complained to Major B—— that Ensign E. S. under his command, had fired into my room, endangering my life, that commanding officer banteringly told me, if I was not shot the next time, to complain, and he would notice it.

And

Whilst the alleged offence against my life was passed over unnoticed, the following sweeping censure of my conduct appeared in Regimental Orders of the 29th July, 1852:—"Ensign White having shown himself quite incompetent to be entrusted with the 6th Company at practice, the target practice of the 6th Company is postponed until further orders."

However, Ensign White displayed under these persecutions a truly admirable spirit, as illustrated by his reflections on the case:—

We are too prone [he says] to regard it as a divine judgment when any signal calamity befalls one who has deeply wronged us; but we erring creatures should be very careful how we indulge this feeling, lest it should degenerate into a revengeful emotion. Still I cannot help regarding it as a remarkable circumstance that, a year after the target practice affair, Mr. T—— died of cholera at Benares, and a few days afterwards Captain M——, who had taken such a part against me, died likewise of the same terrible disease.

Ensign White got off this court-martial with a reprimand, and a medical Board pronounced him fit and sane, while his persecutors, as he styles them, were providentially cut off by cholera. He was subsequently transferred to the newly-raised 3rd European Regiment, which was shut up in Agra during the Mutiny. It might be thought that, at such a time, when the small bands of Europeans at each post held by us were defending their lives with their backs to the wall, occasions for small squabbles would hardly have been found. But Lieutenant White managed to get involved in a quarrel with another subaltern, who upset his chair, thereby throwing him on to the floor; and the lieutenant, appealing against the commanding officer's ruling in the matter, was put under arrest with a view to his being tried by court-martial for litigious and unofficerlike behaviour. However, he was released after being kept five months in arrest. In fact, our author appears to have passed the whole of his service in quarrels with his brother officers and making applications for appointments which were not given him. He frequently in these Memoirs expresses surprise at his unpopularity; but he naïvely tells an anecdote which sufficiently explains the degree of esteem in which he was held in the regiment:—

Talking about smoking reminds me of one of my *bon-mots* on the line of march. The fact is that, to spare my own cigars, I used always to accept one whenever it was offered to me. At last this attracted so much observation that my brother officers, in a pleasant way, wanted to know how it was that I never refused the gift of a cigar. "Why," I replied unblushingly, "I am just following the maxim of the Duke of Wellington to live on the enemy." "Surely," they laughingly replied, "you don't call us your enemies?" "Yes," I replied in the same strain, "you are; for you are more enemies to me than I am myself." I flatter myself that on this occasion I had the best of the argument in every point of view.

Such is our author as painted by himself. Applying to the Commander-in-Chief for an appointment, Captain White, as he now was, was desired to produce a certificate of qualification from his commanding officer. Explaining to the Military Secretary his inability to do this, "on account of the very peculiar and extraordinary circumstances of my case in relation to the records of my regiment," a Board was ordered to assemble and report on his proficiency as a military officer:—

The examination lasted four days, and I felt confident that I got through the first three days with credit and success. But on the third day, being told beforehand of the programme for the following day, I very unwisely gave expression to my gladness at finding I was well up in it. But when I came next day to be examined I found, to my astonishment and dismay, that advantage had been taken of my candour, so that the programme was entirely changed, and I was examined in something else I was not at all well up in. The result was that I failed to pass my examination. The result was so unfair and spiteful—so it seemed to me—that, had Sir Hugh Rose been acquainted with it, I think he would have given me another chance. But for this I might, humanly speaking, have been now a commanding officer of a native regiment instead of a retired officer from a service I have dearly loved from my boyhood.

It is certainly fortunate in the interests of the Indian army that Sir Hugh Rose did not become acquainted with it. "This disappointment was followed by my being sent back to my regiment, owing to the capricious conduct of the officer commanding H.M. 6th Foot" (to which regiment the captain was temporarily attached as interpreter), "who said he did not want an interpreter to his regiment." However, Sir Hugh Rose took compassion on him, and to save him from a long and expensive journey to rejoin his own regiment, made him garrison interpreter at Fort William. "The fort adjutant was a capital fellow," says the autobiographer; "I always found him very obliging, and I am very sorry that he is dead"—therein showing a truly Christian spirit. But generally throughout his service every one, from the Governor-General downwards, was in a conspiracy to annoy and ill-treat our author. The captain of the ship in which he went out to India bullied him, and the captain of that in which he went home was little better. "Of him I have only to say this, that I found him a most disobliging and very disagreeable man. I found him dreadfully stingy whenever I wanted to be helped to anything nice, and he used to watch the wine I drank in a most offensive manner. . . . There is nothing," observes Colonel White appropriately, "like a long sea voyage for discovering the selfishness of human nature. Those get on best who make the most fuss or who have some one to make a fuss for them."

It is easy to understand from these extracts how it was that Colonel White by his own artless exhibition of himself succeeded in becoming universally unpopular, and one feels that in any other army than the long-suffering one of the East India Company, his military career would have been cut short at a very early stage. But of all the blunders made throughout his life, the greatest is surely the publication of this book; it is unfortunate that he should have had no friend to step in and prevent him from making such an exhibition of himself. Yet it seems quite possible that even now Colonel White will not understand why its publication should damage him in the reader's estimation.

BARDSLEY'S CURIOSITIES OF PURITAN NOMENCLATURE.*

IF readers of Walter Scott's *Woodstock* are led to suppose that Merciful Strickalthrow and Gracebehere Humgudgeon are fair samples of names borne by Puritans during the times of their ascendency, they may not be very far wrong; but it is by no means difficult to overshoot the mark and to look on mere extravagances as the ordinary result of a system. The man whose name is most commonly associated with the Rump Parliament had, it seems, three brothers, of whom one was called Fear-God Barebone. Of the two others one was designated "Jesus-Christ-came-into-the-world-to-save Barebone," and the other "If-Christ-had-not-died-for-thee-thou-hadst-been-damned Barebone." Whether these names were used at their baptism, we cannot say; but "Fight-the-good-fight-of-faith" appears to have been in existence in 1629, and if parochial registers may be taken as evidence, the length of a child's name was by no means an insuperable hindrance to the bestowal of it at the font, although for the needs of daily life such names were usually reduced to the first or the last syllable, the brother of Praise-God being thus, for instance, familiarly known as Dr. Damned Barebone. Such absurdities would be sure to

* *Curiosities of Puritan Nomenclature.* By Charles W. Bardsley. London: Chatto & Windus. 1880.

provoke reprisals. The register of St. Helen's, Bishopsgate, for the year 1611, tells the short tale of Job-rakt-out-of-the-ashes, a child born on the last day of August "in the lane going to Sir John Spencer's back gate," and there "laid on a heap of seacole ashes," baptized the next day, and buried on the day following. A longer life may have been granted to "Dancell-Dallphebo-Marke-Antony-Dallery-Gallery-Cesar, sonn of Dancell-Dallphebo-Marke-Antony-Dallery-Gallery-Cesar-Williams," whose name appears in the register of the parish church of Old Swinford. But these extravagances, and the names which parodied them, throw little light on the origin of practices which may in our eyes be simply ridiculous. In a will bearing date 1665, Theodore Crosland, Senior Fellow of Trinity College, Cambridge, leaves a bequest to What-God-will Crosland; and in the same century, Good-gift and Free-gift are found as names of sons and daughters. But in such designations there is nothing distinctively Puritanical. Not only do Renovata, Renatus, Donatus, Beata, occur in times which were then ancient, but the What-God-will of Crosland's will is simply the Quod-vult-Deus of the fourth century, and may in this instance have been suggested by the baptismal name of the testator. Mr. Bardsley warns his readers that many of his examples of Puritan eccentricity will be found to be "nothing more than literal translations of names that had been in common vogue among Christians twelve and thirteen hundred years before," and he adds that to change the Latin for an English dress would, for most of the Puritan clergy, be as necessary as the adoption of Tyndale's or the Geneva Bible in the place of the Latin Vulgate. Of names so translated he mentions Deo-gratias, Habet-deum, and Adeodatus, which suggested the later Deus-dedit. But these are, after all, mere translations from Greek names which carry us back to prehistoric ages. Adeodatus represents the Greek Theodoros, and this generic title had a multitude of kindred names which signified the good will or the gifts of particular deities. Those of Athene, Apollo, Dionysus, and Zeus are seen in Athenodorus, Apollodorus, Dionysidorus, and Zenodorus, while in the historian Herodotus we see the child who comes as the gift of Hera.

The history of Puritan nomenclature follows, therefore, broadly the laws which have determined the selection of names in almost all ages; and the correction of mistakes which have arisen from forgetfulness of this fact forms no small, and not the least important, part of Mr. Bardsley's task. The Puritans had acquired a strong hatred for everything which they regarded as Pagan or Popish, and of all such things they thought that they had foresworn the use; but although their choice might be frequently swayed in favour of Scripture designations, they could not free themselves from the feelings which influence mankind generally, and Mr. Bardsley has carefully pointed out the degree in which Puritan names disappoint the notions commonly entertained about them. They are not, for the most part, sour or grim, desponding or despairing; as a rule, they are not less cheerful than those which they displaced. The names which are made up of Scripture phrases or of other hortatory sentences must be placed by themselves; but for all practical purposes Jacob, Zacharias, and Ezekiel stand on the same footing with Edgar, Henry, or Richard. Some of the Puritans, who ought to have known better, were of course wholly ignorant of this fact. Children ought to be called after the names of those who are reported in the Bible to have been godly and virtuous. Acting on this rule, Edmund Snape, the bearer of a right good old English name, promised to baptize a son of Christopher Hodgkinson in the church of St. Peter, Northampton, and was told that the name chosen was Richard. At the time of service Snape went on till it came to the naming; but, at this point, Strype tells us, that "hearing them call it Richard, and that they would not give it any other name, he stayed there and would not in any case baptize the child; and so it was carried away thence, and was baptized the week following at Allhallows Church, and called Richard."

But, if we must say that the principles of naming remained on the whole the same, the change of which Mr. Bardsley speaks as the Hebrew invasion was a serious revolution in the history of English names. It was, however, not the first revolution of the kind which had taken place since the days of the Teutonic conquest of the island. Before the time of Edward the Confessor Scripture names were unknown in this country; but although Domesday Book has, Mr. Bardsley tells us, "no Philip, no Thomas, only one Nicholas, and but a sprinkling of Johns," still, "before many generations had passed, Bartholomew, Simon, Peter, Philip, Thomas, Nicholas, John, and Elias, had engrossed a third of the male population." The names were confessedly Biblical; but they came to the people not from the Scriptures but through the Church calendar. The wonder was that the scanty supply could, even when eked out with such Teutonic names as remained in use, meet the needs of the people. A single village, and that not a large one, might have a dozen Johns or Bartholomews; and two or three of these might belong to the same family. One was distinguished from another partly by the use of prefixes, more frequently by diminutive or pet suffixes. A father John of Gyrton is found to leave his goods to his sons Old John and Young John; and another father, John Barker, has three sons named John Barker and two daughters named Margaret Barker. The difficulty was solved by changing the form of the name. Bartholomew was the formal baptismal name of boys and men who were known as Bate, Bat, Batty, Bartle, Bartelot, Batcock, Batkin, and Tolly, or Tholy. These variations give us some of the suffixes which have yielded a multitude of names seldom traced to their true origin. These suffixes are Kin, Cock, On or In, Ot and Et; and on each of these Mr. Bardsley has a good deal to say which ought to interest and amuse those who have not given much attention to the subject. With the first of these suffixes we are, or ought to be familiar; it is found in manikin, lambkin, pipkin, kilderkin, and many more. For the names of men and women it has produced Malekin and Janekin, Wilckin (Wilkin), and Watkin. A great impulse was given to these names by Flemish immigrants; but most of them are now employed as surnames; and they are legion. Mr. Bardsley gives us among his examples Lampkin and Lambkin (Lambert), Tonkin (Antony), Dankin (David), Simkin (Simon), Tipkin (Theobald), Tomkin, Walkin (Walter), Perkin (Peter), Hankin (Hans), Halkin or Hawkin (Henry). The same remark applies to the forms furnished by the second suffix Cock, which implied the freshness of lusty and swaggering youth. Thus Jeffrey, Simon, and Bartholomew became Jeffcock, Simcock, and Batcock; and the men once known under these forms of their baptismal name were so known to the end of their days. From this source we have Laycock, as the pet name of Lawrence, Pidcock and Peacock of Peter, Hitchcock or Hiscock of Higg or Hick (Isaac), Hancock of Hans, Wilcock of William. All these names belonged to the lower orders of the people. Of the terminations in *on* or *in*, *ot* and *et*, Mr. Bardsley says that they were "the introduction of fashion, and being under patronage of the highest families in the land, naturally obtained a much wider popularity." But the result was much the same. Most of these have become surnames, Hugh having given us Huggins and Hutchins, while Gibbon comes from Gilbert, Perrin from Pierre, Peter; Collins from Nicholas, Tippings or Tippins from Theobald. Marion remains in its old shape as a girl's name; but instead of being regarded as a pet form of Mary, it is commonly looked upon as an abbreviation of Mary Anne. The suffix in *ot* or *et* had at first the highest favour; it is a common one in our ordinary speech, as we may see from our words *lancet*, *ballet*, *pocket*, *target*, and *paget* as a little page. As Christian names, Emma and Matilda became Emmot, Emmet, and Tyllot or Tillet, while Isabella passed into Ibot and Ibet, whence Ibbotson. On this suffix all that Mr. Bardsley has to say is especially interesting. We are introduced to Wyatt as the pet form of Guy, Hallet as that of Henry or Hal, Hewett as that of Hugh. Hamnet, or Hamlet, he traces to Hamon or Hamond, a name brought in from Normandy, through the forms Hamonet and Hamelot. It would, however, be rash to assert positively that this is the explanation to be given of the Hamlet of Shakspeare. This name, it can scarcely be doubted, is the counterpart of the Danish Havelock, a name appearing sometimes as Aulafcwiran, as Anelaphus among the Norse kings, as Havelocke in the metrical romance of Guy of Warwick, perhaps also as the Danish Chochilaichus of Gregory of Tours, and certainly in the Latinized Amlethus. But whatever be the origin of the Danish Hamlet, the great popularity of the suffix in this country is unquestionable; and its disappearance in baptismal names is certainly surprising. In Mr. Bardsley's words:—

> It is hard to realize that a custom equally affected by prince and peasant, as popular in country as town, as familiar in Yorkshire and Lancashire as in London and Winchester, should have been so completely uprooted that ninety-nine out of the hundred are now unaware that it ever existed. This was unmistakably the result of some disturbing element of English social life. . . . In France the practice went on without let or hindrance. We can but attribute it to the Reformation and the English Bible, which swept away a large batch of the old names and pronounced the new without addition or diminution. When some of the old names were restored, it was too late to fall back upon the familiarities that had been taken with them in the earlier period.

But in times preceding the Reformation people were not always contented with one suffix, and the employment of double terminations has produced a large crop of names. Thus from Nicholas we have first Colin and then Colinet, from Robert Robin and Robinet; but the usage was chiefly French, and here we have Margotin from Margot, the pet form of Margaret, Hugonet and Huguenin from Hugh, Perrotin and Perronet from Peter. Hence Mr. Bardsley insists that Hugonet is the same as Huguenot; and adds that, "had English, not to say French, writers remembered this old custom, they would have found no difficulty in reducing the origin of the religious sect of that name to one individual as a starting-point." This certainly, if the case be so, knocks on the head the explanation, received by many as conclusively proved, which refers the word to the Teutonic Eidgenossen, the Swiss confederates.

The Hebrew invasion was disastrous chiefly as arresting summarily for a large portion of the people the usages of naming which, with some breaks by no means fatal, had prevailed since the conquest of the island by the English tribes. Except on this ground there is no conclusive reason for preferring Jehoshaphat to Harold or Harold to Jehoshaphat. But, although for men of average intelligence and with fairly sound sense this was the limit of the change, it opened for some the floodgates of absurdity. For these it made no difference whether the names which they pitched upon were names of persons or names of places. They would present a child for baptism under the name Ramoth-Gilead as readily as under that of Jonadab; or they would choose words which are not names at all. "Sirs" was a word so selected, on the authority of the phrase "Sirs, what must I do to be saved?" But, for the most part, there is not very much to be urged against the Puritan names, except that they were adopted arbitrarily and as a most uncalled-for protest against names in every way more suitable for Englishmen, names which were either genuine English or

which belonged to the time-honoured catalogue of the Christian saints. The names now chosen were either those of Jewish heroes, kings, and prophets, or words expressive of graces belonging to the regenerate man. To names of the latter class we may be easily reconciled; not a few of them have acquired a special charm in the pages of the *Pilgrim's Progress*. Far from thinking that the names in this allegory are to be ascribed to Bunyan's imagination, Mr. Bardsley believes that they are simply those with which he had been long familiar:—

> Born in 1628, Bunyan saw Puritan character names at their climax. Living at Elston, he was within the limits of the district most addicted to the practice. The four damsels, Discretion, Purity, Charity, and Prudence, may, and must have, in part been his companions in his boyish rambles years before he met them in the Valley of Humiliation. . . . The name and sweet character of Faithful might be a personal reminiscence, good Father Honest a quondam host on one of his preaching expeditions, and Standfast, 'that right good pilgrim,' an old Pædo-Baptist of his acquaintance. The shepherds Watchful, Sincere, and Experience, if not Knowledge, were known of all men in less pastoral avocations. And as for the men that were panelled in the trial of the Diabolonians, we might set them side by side with the Sussex jury, and certainly the contrast for oddity would be in favour of the cricketing county.

The names of the Sussex jury are given from Brome's Travels; and their existence as actual names is further proved by the evidence of parish registers. Mr. Bardsley has tracked them out with resolute pertinacity; but the interest of his volume is by no means confined to the sections which treat of Puritan eccentricities. Those which trace the origin of double and treble names are especially excellent; and, indeed, the book from first to last can be spoken of only in terms of high praise.

LANG'S THEOCRITUS.*

THOSE scholars, and they must have been numerous, who were delighted by the appearance of Messrs. Butcher and Lang's Odyssey some eighteen months ago may well have felt misgivings on hearing that one of the translators was about to publish an English prose version of the idyls of Theocritus. The task, if less ambitious than the previous one, was assuredly more delicate. The baldest translation of Homer cannot quite conceal all the grandeur of the original, though even the best may fail to do it justice; but it might well have been doubted whether a writer like Theocritus, whose charm depends so entirely upon minute picturesqueness of detail, would have borne the transition from one language to another, still more that from verse into prose. All such doubts and fears have been removed by the appearance of this volume, which we may at once pronounce to be as near as possible to perfection, whether it is regarded as a scholarly translation or as a masterpiece of graceful English writing.

The introductory essay contains an interesting study of the genius and surroundings of Theocritus. It depicts him living an easy life among the shepherds of Sicily, and becoming thoroughly versed in the rural songs of the people; then it tells of a period of education in the island of Cos, where the poet lived in the companionship of refined and gifted men, and in the midst of such scenery as would best inspire his pastoral strains. After this preparation we follow him to the Court of Alexandria, where, as Mr. Lang suggests, his own tastes in poetry must have been very much modified by the nature of the demand which he found there. It may indeed be doubted whether Mr. Lang does not make too much of the difference between the rustic and the epic idyls, when he says that in the former Theocritus wrote to please himself, and in the latter to please the taste of Alexandria. So earnest a seeker after Court favour was not likely to spend much time in amusing himself by practising an unpopular form of literary composition. It seems more probable that, finding it difficult to make himself conspicuous among the crowd of literary men in Alexandria by competing with them in hackneyed imitations of the older epic poets, he struck out an entirely new line for himself from recollections of his earlier days among the valleys of Sicily and by the streams of Cos. This view is strengthened by the fact that all his pictures of scenery are such as would appeal with special force to dwellers in Egypt. The cool caves and overhanging rocks would have a peculiar charm in a country where the universal flatness is only relieved by a range of low sandhills skirting the shore; the thick shade of the woods, and the rustling of the wind through the leaves would be contrasted in the hearer's mind with the glowing sunshine of Alexandria, broken only by an occasional palm-tree, while the ripple of a rushing stream would be the more delightful when compared with the stagnant pools of the Mareotic lake. Again, it seems to us that Mr. Lang rather overstates the indebtedness of Theocritus to the shepherds' songs of Sicily. It is impossible to imagine that the country swains of Theocritus's time were so refined as Mr. Lang would have us believe, and we are not in a position to decide how far the modern Greek ballads which he quotes in support of his argument are the spontaneous utterances of the people who sing them. In dwelling on the truth and simplicity of the pastoral idyls, Mr. Lang seems to be comparing them rather with the more elaborate attempts of later imitators than with the rustic songs which first suggested them. Pastoral poetry as a form of literature has always been most popular in a highly artificial state of society, where the realities of rural life are least familiar, and where, therefore, the ignoring of its gross and vulgar aspect would not appear ridiculous. Rural idyls in such circumstances give happy expression to the longing which all must at some time feel for a recurrence to a simpler life, free from the bustle and turmoil of great cities, and from the varied discomforts of climate felt, though in widely different ways, by the rheumatic Briton of to-day and by the scorched dweller in Alexandria two thousand years ago. This feeling of gentle regret has inspired the lines by Mr. Dobson and Mr. Gosse, which are prefixed to the present translation. Mrs. Browning has expressed the same thought in one of her most beautiful sonnets, and Mr. Lang himself has delicately touched the same chord in the little volume of verse which he has lately published. The facts relating to the life of Theocritus are so scanty that each reader may construct for himself a theory of the poet's character, and of the sources of his inspiration, without fear of any authoritative contradiction. Mr. Lang's is, if not in all respects the most probable, certainly the most pleasing estimate; and his impressions are entirely consistent with the writings which have come down to us:—"In Theocritus we find the most genial character; pious as Greece counted piety; tender as became the poet of love; glad as the singer of a happy Southern world should be"—living, in fact, for climate and the affections, like the heroine of *Lothair*—"gifted, above all, with humour and dramatic power."

When we pass on to the translation itself, the task of the critic becomes light indeed, for there is little but admiration to be recorded. The English version follows the Greek so closely, and at the same time so gracefully, that neither minute verbal criticism nor the wider considerations of literary taste can find anything to quarrel with. Wherever in the original a word derives special force from its peculiar position in the sentence, the effect has been preserved in the translation without any semblance of awkwardness. Quaint old English phrases and expressions, happily remembered and aptly applied, occur here and there, and seem to add depth of meaning to the Greek which they so exactly render. Even the help of rhythm—we had almost said of metre—is not wanting. Many entire passages would, with very slight alteration, run into verse. Sometimes a pure hexameter line helps us to realize the sound as well as the sense of the poet, and often the swing of the original, without being exactly imitated, is gracefully suggested by the easy flow of the prose translation. So naturally are all these effects contrived, without any straining of sense or syntax, that those who have never tried their own hands at such work may well be tempted to suppose that they arise of their own accord from the natural capabilities of the language and the subject, instead of being brought about by consummate art on the part of the translator.

Mr. Lang handles the humours as happily as the beauties of Theocritus. The well-known dialogue between the two Syracusan gossips, their effusive chatter about their household affairs, Praxinoe's vulgar outburst of gratitude to the kindly stranger who helps them through the crowd, and Gorgo's violent tirade against the less considerate person who tries to check her flow of conversation, are admirably done. So, too, is the hymn to the Dioscuri, where the description of the boxing-match between Polydeuces and Amycus is made graphic by an approximation to the language of the prize-ring, without being in the least vulgarized.

It is indeed difficult to say that any one idyl, or any one passage, is better done than any other. The different degrees of excellence are rather in the poet than in the translator. Perhaps the following passage, taken from the latter part of the Seventh Idyl, may serve as well as any other for an example of the beauty and closeness of the translation, while it will at the same time give some idea of the exquisite power of minute description and keen enjoyment of life which form the chief charms of Theocritus:—

> High above our heads waved many a poplar, many an elm-tree, while close at hand the sacred water from the nymph's own cave welled forth with murmurs musical. On shadowy boughs the burnt cicalas kept their chattering toil, far off the little owl cried in the thick thorn brake, the larks and finches sang, the ring-dove moaned, the yellow bees were flitting round the springs. All breathed the scent of the opulent summer, of the season of fruits; pears at our feet and apples by our sides were rolling plentiful, the tender branches with wild plums laden were earthward bowed, and the four-year-old pitch seal was loosened from the mouth of the wine-jars.

In only two cases, and even in these with considerable diffidence, do we venture to suggest alternative renderings. In Idyl xxvii., a dialogue between Daphnis and his bride, which is only doubtfully ascribed to Theocritus, Daphnis referring to the fact that Paris was a shepherd like himself, says, "'Tis rather this Helen that kisses her shepherd, even me." The maiden replies:—

μὴ καυχῶ, σατυρίσκε· κενὸν τὸ φίλαμα λέγουσιν,

which Mr. Lang translates:—"Boast not, little Satyr, for kisses they call an empty favour." Would it not be more appropriate, and perhaps more consistent with the Greek, to take the line as a reference to the later legend, adopted by Euripides, according to which Helen herself was carried off to Egypt, and only her phantasm accompanied Paris to Troy? The sense would then be, "Boast not the analogy of Helen; they say that hers was but an empty kiss," and the reference to Egypt would be particularly acceptable to Ptolemy and his Court. In the Sixth Idyl, Daphnis, who is singing of the wiles of Galatea, says, "*Τὸν ἀπὸ γραμμᾶς κινεῖ λίθον.*" This is paraphrased as follows:—"She plays out all

* *Theocritus, Bion, and Moschus, rendered into English Prose; with an Introductory Essay.* By A. Lang, M.A. London: Macmillan & Co.

her game, and leaves her king unguarded," which gives the general sense well enough; but as the reference is to a game more akin to draughts than to chess, it would perhaps have been better, and certainly closer to the Greek, to render it by some metaphor taken from the game of draughts. "She plays out her back row of men" would be more literal, and, in our opinion, quite as expressive.

These are, after all, trifling points; but masterly work such as Mr. Lang's teaches criticism to be minute. It would be an endless task to point out the numerous instances where the happy and exact rendering of a word or a phrase is of itself enough to stamp the translation as the work at once of a scholar and of a master of English. It will be enough to mention a few, and leave intellectual Jack Horners to pick out the rest for themselves. The Tenth Idyl is rich in examples. Ἐργατίνα βουκαῖε is happily rendered by "thou toilsome clod"; "chip of the stubborn stone," which is the equivalent of πέτρας ἀπόκομμ' ἀτεράμνω, is aptly suggestive of an English proverbial phrase; and "men of straw" corresponds exactly to σύκινοι ἄνδρες in the original. In the Fourteenth Idyl, in the account of the drinking bout, ἤδη δὲ προϊόντος, translated by "when things were now getting forwarder," affords a happy reminiscence of a similar scene in *Punch*, while the meaning of the Greek is at the same time perfectly rendered. It is seldom indeed that a Greek phrase baffles Mr. Lang's ingenuity to match it in English. When, however, this does happen, as it must sometimes, he has not hesitated to expand rather than scant the meaning of the original. Thus, in the idyl last mentioned, "I shall go mad some day, when no man looks for it; I am but a hair's breadth on the hither side even now," seems rather a lengthy version of the Greek, "λασῶ δὲ μανεὶς ποκα, θρὶξ ἀνὰ μέσσον"; but it is difficult to see how the meaning could have been fully expressed in fewer words.

We have said enough to justify our opinion that this is one of the most elegant and scholarly translations which it has been our fortune to meet with. Let us hope that it may serve to revive interest in a poet who for some inscrutable reason is strangely neglected nowadays, although he has, both directly and through his many imitators, exercised an influence upon modern poetry and painting the importance of which it is difficult to overrate. The time of year for the publication of the book has been wisely chosen. In the month of August, even under English skies, shade is sometimes more to be desired than sunshine; and it is occasionally possible to lie at full length upon the grass or among the bracken without either a present sense of chill or gloomy forebodings of bronchitis. At such times no one could desire a more delightful companion than the poet who sang of rural life so sweetly and with such keen insight into its varied beauty; and those who cannot listen to his own melodious Doric are fortunate in finding an interpreter at once so faithful and so sympathetic as Mr. Lang.

THE VIOLIN PLAYER.*

It is hard work to read one of Miss Bertha Thomas's stories, but it is still harder to keep it in the mind for four-and-twenty hours after the end of the third volume has at length been reached. The prudent critic would, even before he opened the book, have everything ready for writing his review. He would have his sheets of paper laid on his blotting-pad, and a good pen by the side of his inkstand. He would read on in hot haste, getting over the big words which have no particular meaning attached to them with all the expedition he could, and wading through the descriptions. He would take brief but exact notes of all the loves both of the hero and the heroine, and he would try to understand as much of the plot as could be seen at a glance through the fine language in which it was told. He would not even dare to yield to the chief temptation of the story by taking a short nap. He would be too much alarmed lest, when he woke up, he should find that he had forgotten all he had read. He would not hesitate to promote wakefulness by strong cups of tea, and he would even welcome a German brass band beneath his window to help him in warding off the drowsiness that was growing upon him. Then, when the first part of his task was reached, without a moment's pause he would begin his review, with some degree of hope that he knew enough of the story not to fall into any very great blunder in his description of the plot. This, we well know, is the only safe way of criticizing the novels of Miss Thomas and of some other lady novelists; but this, we regret to have to own, is not the way that we have taken on the present occasion. We have allowed at least three days and three nights to pass over our heads since we parted company with that one of the two heroes who survived to the end of the book, and left him married to one of the four heroines. It is of course easy to turn to the last page and to discover that this lady, the youngest of the heroines, had, in the author's words, "become perfectly indispensable to Val's existence." But how are we to recover the lost threads of the story? The other hero, we know, was murdered. His very name we had clean forgotten, but on turning back we find that it was Gervase Damian. With how many of the heroines was he in love? we ask ourselves; and how many of them were in love with him? We have painfully to turn over the pages of the three volumes once more, and to bring back to our memory as much as we can of the story. He married—of this much we are quite sure—the chief heroine, Laurence Therval, the violin-player, with whom Val was in love. But then he had certainly been in love also with Linda Visconti, and, if we are not mistaken, with Lady Brereton. At all events, this we do know, if he was not in love with this lady before she married Sir Adolphus Brereton, his mother had very much wished that he should be in love, for he was not a rich man, and she was an heiress. It was unfortunate for him that he had not complied with the wishes of his parent, but, in defiance of her, had married a girl who was a rare genius at fiddling; for your fiddle, it would seem, is an instrument of so exalted a nature that it will allow of no rival. Laurence, when a mere child, had been told by her master in the art that she had a great future before her. "Be true to it," he said; "never think that there are not other things which will one day seem greater to you, and more dear than art, and tempt you to neglect it. The sacrifice for a man is great; for a woman it is infinite." She promised him that the first moving power in her life should be her vocation. Unfortunately, the two heroes both fell in love with her at the same time. Val, we should mention, was also in love with Lady Brereton, and in the end married Clementina. She chose Gervase—as contemptible a character, by the way, as we have come across for some time. But the fiddle was not to be thus treated with neglect, and the hand of an Italian bandit avenged its wrongs. The unhappy widow did not touch the fiddle for a whole year, but at the end of that time she took to it again. Val, undeterred by the miserable fate of his rival, was ready to step into his place. It was but four pages off the end of the book, he had broken with Lady Brereton, and his only chance of a wife seemed to lie in the fiddling widow's acceptance of him. But she told him that he was loved by another. "Laurence spoke significantly. Val rubbed his forehead. A light crossed him." He saw who it was that she meant. "'Cherubina,' he muttered, 'I always thought her a child.'" His mistake is pointed out to him, and the two are very quickly married. Laurence sticks to her fiddle, and Clementina, as well befits a heroine, becomes, as we have already said, perfectly indispensable to her husband's existence.

For some while we thought we should have the pleasure of congratulating the author on her moderation. Those who are acquainted with Miss Thomas's novels are aware that her flow of words is often rather too much for her as well as for them. It swamps whatever sense her writings might otherwise have had. But for nearly a hundred pages of the first of these three volumes she really made a considerable effort, we feel sure, to be intelligible. We can easily imagine that, as she composed each paragraph, she carefully read it through, so as to make quite sure that the sense had not been left out. It is true that she opens with a somewhat high-flown description of an evening on Lago Maggiore. But we can allow opaline hues, shimmering islets, and the rest, so long as they are confined to the first chapter. Every story nowadays must begin with a sunset; but the experienced reader knows that night will come on in the middle of the third page, when the characters will be at once introduced. There accordingly he begins to read. Unfortunately Miss Thomas grew weary of the restraint that she put upon herself; and, giving her love of strange and big words full play, all of a sudden she rushes forth into her usual extravagance of language. We must not, indeed, let it be thought that we acquit her of writing a great deal of nonsense even in her first hundred pages; but a sense of justice forces us to own that for at least a third part of one volume she does seem to have done her best not to misuse the Queen's English. But later on we come upon many a passage like the following description of a German teacher of the violin:—"He had on pessimistic spectacles, and saw everything in the light of his own cantankerousness. How many infant prodigies had he seen effloresce into full-grown nonentities!" A few pages beyond this we are told that the fiddling heroine's "idiosyncrasy oozed out on music-paper." Miss Thomas has evidently a great pleasure in metaphors, and she manages to mix them up in the strangest of ways. Thus she writes that a young man's "disaffection was but a new link forged and added to an old chain, and shaking its irons, which had entered so deeply into the old man's soul." Now we have heard of links being added to a chain, and we have also heard of the iron, but not irons, entering a man's soul. But till now we had never heard of a link shaking its irons anywhere, least of all in a man's soul. In another passage we read that the female fiddler's name "in crossing the Alps had gathered round it the usual halo of fable that follows notoriety about like a shadow." It is bad enough to turn a halo into a shadow, but it is still worse to have it gathered round a thing and following it at one and the same time. Linda, the famous female fiddler's rival, was not left far behind her so far as metaphors are concerned. "She vanished with a suite of theatrical satellites—like a brilliant comet with its tail." It may perhaps be the case that the author does not here use "satellites" in its astronomical sense. If this should be so, we must ask her pardon for giving this passage as an instance of her confused metaphors. But appearances are against her, and we believe we shall not be doing her injustice if we assume that she has likened some people to the smaller bodies which revolve round one of the planets, while at the same time she makes them the tail of a comet. In another passage she writes, "The mainspring of society is self-repression." How repression can be a spring it is impossible to imagine. Perhaps she

* *The Violin Player*. A Novel. By Bertha Thomas, Author of "Proud Maisie," "Cressida," &c. 3 vols. London: Richard Bentley & Son. 1880.

may, however, lay the blame on our want of understanding. She may, for all we know, reproach us with having what she calls "a fatuitous head." We suppose she means "a fatuous head," but it is just possible she was thinking of fortuitous. At all events it was some term of reproach that she meant to use, and most of her readers, we feel sure, would readily allow that fatuous, fatuitous, and fortuitous "are all one reckonings, save the phrase is a little variations." We cannot give a just notion of her style if we merely quote a line here and a line there. The following extract, however, though scarcely long enough to do her full justice, will enable the reader to understand how great is the flow of her words, and how weak is the trickling of her sense. She is describing the more worthless of the two heroes—both are worthless enough—at a time when he ought to have been in love with his cousin, had not yet fallen in love with the fiddling prodigy, but was smitten with the charms of Linda:—

His curiosity, excited by the beauty of Linda's voice, had prompted him last evening—his mother and sister chancing to be out of the way—to risk his neck along the balconies for a glimpse of the singer. The vision of that fair nymph-like creature, to eyes oppressed, like his, by long gazing on the lymphatic feminine types in which Bleiburg chiefly abounded, was like water-springs in the desert. He, too, was becoming impatient of the present seclusion. For the last six months he had applied himself entirely to head-work, lived and fared like the bookworm that he was not. The rebound threatened to follow, and with some violence.

A wild idea crossed his brain. Gervase liked wild ideas. A certain *blasé* medium that had encompassed him from his cradle had told upon him, as was inevitable. To charm him, even at three-and-twenty, something racy and piquant was required.

We should be glad to learn how it can be that a man by long gazing on anything that is lymphatic gets his eyes so oppressed that they are refreshed, as it were, by water-springs. Still more gladly should we learn how a medium can be *blasé*, and how a *blasé* medium encompasses any one. We feel that we are too much in the position of the fiddling heroine, who, at the age of eleven, "had never heard of lycanthropy." There are many fine things of which we had never heard till we read the story before us. For instance, "a butterfly that might sting" is made known to us for the first time. We doubt, moreover, though we have, to our sorrow and shame, read more nonsense than a score of ordinary readers taken together, whether we have ever hitherto come across "a petrifaction of an inspiration," or an "essence that went abroad and idealized the sadness of life." We can scarcely be mistaken, moreover, in the belief that we now hear for the first time of "a sense of some affinity of nature which not unfrequently involves a mysterious affinity of destiny too.' We are, indeed, struck by a sense of novelty when we are told that every one liked a certain baronet "in a mild uninitiative way"; but then we altogether fail to catch the author's meaning. Her admirers—for admirers she really has—may perhaps reproach us, in the language of their favourite novelist, with "impervioussness to sentiment," and may accuse us of being "one in whom," to use another of her expressions, "the dew of youth has early hardened into the diamond." It may be so. We can only plead by way of excuse that we were born so long ago that we can well remember the time when fine words were not yet a sufficient cloak for nonsense, and when writers were not allowed openly and grossly to insult the understandings of their readers.

SCOTTISH SPORT BY A VETERAN SPORTSMAN.*

THE veteran author of the *Moor and the Loch* has long been recognized as an undeniable authority on all matters connected with the rod, the rifle, and the gun. That his popularity has been in no way affected by the many works on sporting subjects published more recently by younger men is proved by the recent appearance of a fifth edition of his volumes. Mr. Colquhoun's enthusiasm equals his experience, and that nearly covers the Scriptural three score years and ten. As we learn from a short autobiographical sketch prefixed to the volumes before us, he was born in 1805; he went out with the keepers from early boyhood, and he must have learned to handle a gun as soon as he had strength to carry one. The long list of the shootings and fishings of which he has at one time or another been the happy lessee shows how thoroughly he ought to know all the best sporting counties of Scotland. Nor is anything more interesting than the chapters which he devotes to the changes he has witnessed. Many of these changes he not unnaturally deplores. In his early days rich English strangers seldom dreamed of renting shootings, and, in the absence of easy means of communication, most of the wilder districts of the Highlands lay far beyond the reach of ordinary enterprise. Elaborate preserving of deer and grouse, with the trapping and shooting of "vermin" entailed by it, had not appreciably disturbed the balance of nature. Since then sheep and cattle have been swept from the hills to leave an untroubled sanctuary to the herds of red deer; and even in the low country reclamation, planting, draining, &c., have been proceeding apace till the aspect of broad stretches of landscape has been altogether transformed. One such alteration Mr. Colquhoun describes, in language that is really eloquent, while it evokes for us a vivid picture of the days of the past and the present:—

In "the buried past" the shadow of a rugged waste rises before my mind's eye, as one of the unexplored remnants of primeval nature untouched since the flood. It was full of treacherous swamps, with here and there a granite boulder nearly hidden by heather four feet high. Frequently strayed cattle or horses were drowned in these morasses; for when they got entangled in the mazes of this *terra incognita*, to track them was dangerous, as well as difficult, with little chance of finding the truants until they were stark and stiff, half buried in the rotten fen. Impervious jungles of whin or broom guarded this undisturbed chaos, in spring adorning its outskirts with a perfect blaze of gold, and making even more secure such a stronghold of predatory animals as man seldom cared to invade.

When a schoolboy, I remember how often the hen-roosts were plundered by pine-martens or wild-cats, which nightly crept forth from this sanctuary, and the superstitious awe with which I listened in summer to the cry of the tiger-cat to its fellow, but whether of affection or defiance it never struck me to speculate. For years this "habitation" of wild beasts has been swept away, as if it had never been. Yellow corn has waved over it, deer or sheep have browsed on it, the larger beasts of prey have fled to the mountain, and are succeeded by the polecat and the squirrel, the rabbit and weasel, even by the ignoble Norway rat; and the whole is transformed into a baronial drive rivalling the stately parks of "merrie England."

Necessarily snipe, duck, and water-fowl have been banished from the bogs and morasses that have been drained and fertilized by agricultural enterprise; and, what is more serious, since the mischief has been wrought gratuitously, many of the best salmon or trout streams have been spoiled by the reckless cupidity of manufacturers. But though foxes, with the smaller and fiercer beasts of prey, such as wild-cats and marten-cats, have been steadily driven back, while eagles and the hawk tribes have been relentlessly killed down, other animals have multiplied amazingly in districts where half a century ago they were unknown. Mice have been thinned, and the native breed of the old black Scottish rat has been disappearing before the invasion of the grey Norwegian rat. When a lad, as Mr. Colquhoun tells us, he shot the first rabbit that had been seen on the Luss estates; now of course there, as elsewhere, they have multiplied into a positive nuisance, only to be kept in check by indefatigable trapping. Scarcely less numerous on the upper ranges of the moors and mountains are the lumbering Alpine hares, which sorely try the patience of the sportsman by spoiling the scent for the best-trained dogs. Mr. Colquhoun recals how in 1822 he first made acquaintance with a solitary specimen among the rocks of Ben Voirla. In that season he had shot over the whole of the rugged high grounds at the head of Loch Lomond without setting eyes upon another. Now "like locusts they swarm on Glenfalloch and Corrynge, have descended in force on Arrochar and Glen Douglas, are numerous in Glen Luss and Glen Fruin, disputing possession with their red rivals even to the very verge of 'the Highland line.'" Eight years later the advent of the mountain hare was succeeded by some stray precursors of the squirrels, dubbed tree-foxes by the peasants of the Loch Lomond district. The squirrels had pushed their own way to the northward, and we may add that, to our own knowledge, they have ever since been steadily and swiftly on the march, having left far behind them the rivers that were for long supposed to limit their breeding grounds. But the vast forests of spruces and larches where they find congenial shelter have now for many years been colonized by the magnificent capercailzie, which were introduced and acclimatized by the late Duke of Athol. Grouse and deer have naturally been increasing, while the wild-fowl that used to frequent the reclaimed marshes and bogs have been replaced by partridges and the Lowland hare. But the coveys of grouse have been propagated at the cost of the graceful birds of prey who have had war mercilessly waged against them by keepers, egg-collectors, and naturalists. The golden eagle has almost died out in many districts where he used to be common; and so has the Peregrine falcon, who once used to build by solitary pairs, generation after generation, in many a precipice on the coast, or in inland glens now abandoned to small sea-fowl or jackdaws. Nor have the tribes of the lesser hawks escaped a similar fate, though naturally, thanks to their numbers and comparative insignificance, with them the process of extermination goes on more slowly. And unless some "popular" measure of the Government should put an end to the preservation of game in any form, it seems probable that before another twenty years have elapsed many species of our *feræ naturæ* may become extinct. Should any piece of legislation save them, it will be a proof the more of the truth of the proverb that it is an ill wind which blows good to nobody.

Mr. Colquhoun's volumes are a complete encyclopædia, embracing all recognized sports, with hints innumerable, and suggestions drawn from his own experience, that the young sportsman will do well to lay to heart. But, besides that, there are some very interesting chapters on subjects beyond the everyday beat, such as "Deer-driving in Mull," "Wild-fowl Shooting in the Frith of Forth," seal shooting in the Frith and on some of the Western Lochs, with a day among the wild goats on an island on Loch Lomond. The description of this day is as good a sample as any of the author's most picturesque style, and there moreover is a smack of pathetic romance and adventure about it. Considered simply as wild sport, goat-stalking compares not unfavourably with deer-stalking, as it is accomplished generally by rule and method, and under the arbitrary dictation of some professional stalker. The Loch Lomond goats were descendants of a small herd that had run wild upon the island from time immemorial. Among them were two notorious patriarchs, with flowing beards and superb horns; one of these was believed to be ten years old, while the other was a couple of years his junior. They could hardly have found a safer sanctuary than Crap-na-Gower, or one better suited to their tastes and habits; and it was a most characteristic bit of Loch Lomond scenery. "It rises perpendicularly out of the Loch, by an almost inaccessible succes-

* *The Moor and the Loch.* By John Colquhoun. Fifth Edition. London and Edinburgh: William Blackwood & Sons. 1880.

sion of rocks and shaggy heather, full of deep holes and caverns. Seen at a distance from the boat, with its wild goats brousing among the grey rocks and scaurs, studded here and there by a clump of reverend yews, a finer study for the artist's pencil could not be found." Disembarked upon Crap-na-Gower, the sportsman swept it according to rule with a telescope. The unsuspecting goats were soon detected, as it happened, "munching their delicious repast of yew twigs, in the full enjoyment of a midday sun." The stalk was made, creeping up behind a knoll by way of cover, through broken rocks and boulders hidden by the heather which in its rank luxuriance reached above the waist. Mr. Colquhoun's own description of the scene that ensued throws all our sympathy on the side of the goat. With no reason to suspect the presence of an enemy, there he stood within fifty yards, rearing himself leisurely on his hind legs, and reaching out his horned head to crop the twigs of a yew-tree. The shot struck him full in the middle of the shoulder, yet he did not drop. At the report of the rifle, his venerable companion started for the covert hard by, and the two made their retreat at a swinging gallop, disappearing speedily in the inequalities of the rugged ground. But the line of their flight was marked by sentries, placed for the purpose, who headed them back and signalled their direction. Stripping himself hastily of his superfluous clothing, Mr. Colquhoun started at full speed to intercept his quarry, and had barely time to regain his breath a little when the second goat reappeared, descending the pass he was guarding. The fugitive offered a fair side-mark; and the aim was but too true. "The poor animal gave a cry, something between a bleat and a howl (it was far too human to be agreeable), walked on a hundred yards, and then stopped. . . . With one desponding look at his own Crap-na-Gower, which he now despaired of reaching, and was never to see again, he turned his back upon it, and hobbled slowly to the shore." "When I peeped through the heather, he was standing with his side to me, and his head sunk down nearly to the rock, the very picture of meek despair." Another shot put him out of his misery, when the sportsman admired his prize with very mingled feelings. And the satisfaction with which he rowed back to the mainland was largely tempered by remorse, for all the researches made by himself and his followers had failed to discover the first goat, and the unfortunate animal might be lingering in his pain. So next day Mr. Colquhoun gave up a shooting party on the mainland and returned to the Lone Isle. Fortunately, on that occasion the quest was successful. One of the gillies actually winded the goat, who had sought out a lurking-place among the rocks and the heather, and he had hardly been disturbed from it when a shot finished him. There is a good deal that is touching as well as exciting in the story of the goat-hunt; and, no doubt, there are many people who will take exception to it. The "inhumanities of sport," which are practised habitually by the kindest-hearted and most humane of men, are indeed among the most singular and inveterate inconsistencies of human nature, and seem to suggest an interesting study for psychologists. However this may be, Mr. Colquhoun's valuable contribution to the "Sportsman's Library" is a book that is worth reading again and again.

LES DEUX MASQUES.*

(Second Notice.)

IN our first notice of M. de St.-Victor's work on Æschylus, we hoped to have said all that needed to be said against the method of the author. We found fault with his habit of introducing references to Brahmanic literature, which had, as the Greeks used to complain, nothing whatever to do with Dionysus. Unfortunately M. de St.-Victor's use of "Aryan mythology" is not confined to his early chapters on the origin of the drama. He constantly stops in the midst of his description of the actions of a play to give his own reading of the mythological character of each person as each appears on the stage. Thus Oceanus arrives, in the first part of the *Prometheus Vinctus*, to favour the Titan with his advice. It is irritating to be checked in the midst of the drama by a long passage about the mythical nature of Oceanus. Matters are not mended by the following characteristic figure of speech. Prometheus is wearied by Oceanus and his well-meaning harangues:—"Il se débat sous le froid verbiage du dieu aquatique, comme s'il subissait la question de l'Eau." The torture by water is thus fancifully compared to the prosy speeches of the old God of the ocean-stream. Superfluous as this sort of writing is, the long excursus on the myth of Prometheus is at least as unnecessary to the comprehension of the drama of Æschylus.

Whatever may have been the origin of the conception of the thief of fire, Æschylus certainly thought of him only in his latest stage of development as the hero whose face, like that of Bacon's Master, "was that of one who pitied men." Æschylus himself probably put the last hand to the completion of the myth. In his play Prometheus is not only the giver of fire, but the inventor of writing—an art which Æschylus, unlike Mr. Paley—recognizes as of immemorial antiquity. Among most races, Aryan or not, we find a hero who is the father of human civilization. The Finns have Wainamoinen; the Polynesians, Maui; the Kamschadals, Kutka; the Algonquins, Manabozho. These characters, we think, are nothing more than idealized magicians, and we would be content to look at the story of Prometheus as the highest and most refined form of a myth naturally found among all early peoples who have asked themselves the question, "Whence came our civilization?" But M. de St.-Victor occupies many pages with a mythological dissertation. He begins with the quaternary period, when man lacked fire, till some inventor "brandished, before the eyes of his tribe, an ember which he had lit and which he could light again when he chose." The poet of the *Anti-Jacobin*, when he came to this point in his history of man, merely said—

Hail Fire, &c.,

taking it for granted that the feeblest mind could fill up the rest of the invocation of the element. But M. de St.-Victor gives us what the poet omitted. He tells us all about man among the mammoths, and how the bear was seven feet high, and about "le rhinocéros aux narines cloisonnées." Then "Fire sprang into being, and there was a vast change in the drama of creation." The bear ceased to be seven feet in height, and man became, by the help of fire, the master of the animal world. This is interesting to "the Evolutionist at large," but has little to charm the mere student of Æschylus. Leaving "flints Palæolithic like these, quaternary bones such as those" he has been talking about, M. de St.-Victor tackles the Aryan *pramantha*. Every one, however untutored, has heard of the Aryan *pramantha*, or fire-sticks, which were warranted to light only on each other. We cannot agree with M. de St.-Victor, and with the learned at large, that the Greek word Prometheus is derived from the Sanskrit word *pramantha*. Sanskrit was not in existence when the ancestors of the Greeks left "the cradle of the Aryan race." It is quite certain that our author has no authority for saying that the Vedas are six thousand years old (p. 251), and the Vedic hymns to Agni have no more to do with Prometheus than the hymns of Dr. Watts. We must apologize for this introduction of matter quite foreign to the topic of the drama; but M. de St.-Victor never leaves us an excuse for deserting mythology. When Hermes comes on the stage in the *Prometheus* the description of the action and of the dialogue pauses while we are informed that Hermes "is born in the twilights, and springs from the long lines of gold traced on the horizon by the setting or the rising sun." The theft of the kine of Apollo by Hermes is the stealing of the rays of light by the dusk. From all this we absolutely dissent; and, even if all this were true, and could be proved, the disquisition has no proper place in the midst of a criticism of a drama. We lose sight of the tortured Titan, the sweet choral voices are lost in the distance; while we eagerly protest against the crude hypotheses of a mythological school that revels in vague analogy and hazy conjecture. The very daughters of Danaus are not permitted to be women; they are the fifty streams of the dry and thirsty Argolid. The interest of the drama is a human interest, which is all frittered away by discussions about the Dawn, the Twilight, Agni, Indra, and the rest of the furniture of writers like De Gubernatis.

Happily for M. de St.-Victor and his readers, there are certain Æschylean dramas in which the human interest quite overpowers mythological curiosity. We have been told again and again that Agamemnon is the sun, and Helen the dawn, and, if he had cared to do so, M. de St.-Victor might have filled in the criticism of the *Oresteia* with this cheerful sort of doctrine. But the human interest of that *chef d'œuvre de la terreur*, as he calls it, overcomes the mythological temptations, and M. de St.-Victor gives us, in impressive language, a sketch of the dreadful trilogy. People who have been fortunate enough to see the *Agamemnon*, as it was performed this year in the original, must remember the awful impression made by that gloomy drama, and the involuntary shudder with which they saw Cassandra pass behind the palace door. "La porte roule et retombe sur elle comme la pierre d'un tombeau." It is not impossible to imagine the effect which must have been produced by the succeeding terrors of the trilogy, by the matricide, by the apparition of Clytemnestra's ghost in death, still insatiate of vengeance, still hounding on against her own son the formless horrors of the *Erinnyes*. Dropping his mythological fancies, M. de St.-Victor tells the story of the house of Pelops in all its savage horror. He leaves no crime concealed of all these that left their curse to haunt the chambers of Mycenæ:—

> The very air of the house of Atreus is heavy with the last breath of the slain, Cassandra and the chorus cease not to invoke their spectres; their dead feuds inflame the living hatred of their children's children. Over these a black swarm of phantoms is flitting, coming and going from their lips, in their speech, like the devils of men possessed. The haggard ghosts wander in the porticos of the palace, they lie in wait about the tomb of a murdered sire, they huddle and mope in the dim background of the stage. They lean forward to listen to the dialogue, they move among the murderers as they conspire, and mingle a deathly whisper with their tragic utterances. When the crime is planned, they gather, and fiercely speed on its accomplishment.

It is to the house thus haunted that Agamemnon returns from the great war that closes the heroic cycle, a triumphant victor. Even in the first speech of the watchman you catch an ominous word, "la terreur sort déjà de cette réticence de l'esclave." In the speech of Clytemnestra, when she tells the glad tidings of the fall of Troy, there is again a hint of woe. She prays that the army, in the fury of the sack, may not have drawn down the vengeance of the gods. Even the Herald, the only cheerful person in the drama, finds his speech turn to words of ill omen. Agamemnon's arrival brings forth Clytemnestra, with feigned smiles and an ironical welcome. "C'est avec une sorte d'effronterie grandiose que le faux amour y grimace, la tête de Méduse sourirait ainsi."

* *Les Deux Masques.* Par Paul de Saint-Victor. Paris: Calmann Lévy. 1880.

The purple webs she strews before Agamemnon's feet [illegible] first links of the net in which he is captured. The appearance of Cassandra leads to the most moving scene which is perhaps to be found in the whole range of the Greek drama, nor is anything in Shakespeare more romantic than the passage in which the prophetess scents the ancient blood, and sees the spectres of the slain children. In spite of the violence of her final inspiration, of the fury with which, for the last time of all, Apollo fills her, there is, as M. de St.-Victor remarks, a singular charm in the style of Cassandra:—

> Ce qui met encore à part le rôle de Cassandre, c'est l'extraordinaire beauté de son style. . . . Des repos d'une douceur touchante succèdent à ses crises. . . . Son langage redevient naturel et simple, elle répond aux questions du Chœur avec un triste abandon. Ce n'est plus qu'une fille mourante qui regrette ingénument la lumière.

M. de St.-Victor does not devote much space or trouble to the criticism of character. On the Greek stage we see character full grown and, so to speak, ready made. The conditions of the ancient stage scarcely permitted the study of the development of character. In the *Œdipus Tyrannus*, indeed, there is the spectacle of change and growth in the characters both of the Theban King and of Jocasta. But, even so, one could wish that M. de St.-Victor had chosen to write more on the temperament and attitude of Agamemnon, Ægisthus, and the rest. In his eyes the traitor is merely a traitor, who only rises to a kind of ghastly dignity when he tells the tale of the Thyestæan banquet. It is easy to be too subtle when one begins to write about character, and M. de St.-Victor has at least evaded the temptation to rival the Germans in their search for points in Hamlet's soul, or in the soul of Orestes, who, after all, is the tool of destiny. Yet he lingers over Clytemnestra, a figure so enigmatic that the Greek who "created" her part must have had a difficult task. Unluckily for the undergraduates who this year put on the buskin, the traditions of the Greek stage have entirely perished, and we do not know how Clytemnestra was "interpreted." Here is M. de St.-Victor's reading, which it is best to leave in his own words:—

> Figure épouvantable et superbe: si le monde tragique avait un Enfer, la Clytemnestre d'Eschyle en serait la reine. L'instinct maternel survit dans son âme; il y a en elle un reste d'entrailles déchirées qui tressaille encore. Hors de là, rien d'humain et rien de flexible. Ses traits saillants, l'audace forcenée, la férocité froide, l'ostentation dans le crime, sont creusés et fixes comme ceux des statues. L'effrayante unité de son caractère ne se dément pas; la triple haine de la mère frappée dans sa fille, de la femme jalouse d'une rivale, de l'adultère qui veut que l'époux fasse place à l'amant, en noue les jointures. Terrible, mais non repoussante: une sorte de grandeur démoniaque grandit ses forfaits. Il y a de la fatalité dans sa méchanceté. Elle a des façons de dire et de se mouvoir dans le mal qui rappellent les grandes allures de la lionne marchant dans son antre.—"Une lionne à deux pieds," c'est ainsi que le Chœur l'appelle quelque part.

Many passages in M. de St.-Victor's work, especially his keen sense of Shakspearian parallels to the coarsely popular and half comic side of Æschylus's genius, deserve the warmest praise. He energetically defends the great poet against the cold criticism of the last century. In France, from 1660 till the romantic movement began, the world was of the opinion of Du Trallage, and saw little but affectation in admirers of the Greek stage. "J'ai lieu de croire qu'ils sont entestez de l'antiquariat," says Du Trallage. In our time M. Leconte de Lisle has put Æschylus into French prose, and within the reach of all intelligent readers. We wish that M. de St.-Victor had chosen to write his commentary in a more concentrated and less florid manner, and we sincerely trust that, when he comes to Sophocles, he will cease to refer to the so-called Aryan and Vedic sources of mythology.

WEEKES'S LECTURES ON SCULPTURE.*

THIS volume would be welcome were it only as serving to perpetuate the memory of a delicate and accomplished artist who deserved well of his contemporaries, and who is in some danger of being forgotten. Mr. Weekes was not a man of that stirring genius which impresses itself imperiously on the art of an age. His talent was refined, earnest, and genuine, but it was scarcely great, and we may very easily undervalue what he did for English sculpture. The lectures here for the first time published date from the closing years of his life. In 1869 he succeeded, at the death of Westmacott, to the Professorship of Sculpture at the Royal Academy. He was already an elderly man, and had attained the final honours of his profession; but his sense of responsibility was so great that he went to Italy and worked at the history of sculpture there as laboriously as though he had been a young student. When he was re-elected, in 1874, he did the same thing, although at that time he was on the verge of seventy, and in a condition of health which made travelling painful to him. His earnest and useful life came to a close in 1877. There are many among us who can recall the manner in which these lectures were delivered, and who will read them with some surprise at their intrinsic excellence. Mr. Weekes had a feeble voice and a hesitating utterance, and from the point of view of delivery was an ineffectual lecturer. He woke up every now and then to make some little humorous remark that seemed scarcely congruous with the matter in hand; but his lectures were worth listening to, and still more worth reading.

Henry Weekes was born at Canterbury in 1807, where his father was clerk in a bank. The boy's first very distinct proof of plastic talent seems to have been given in his twelfth year, when he modelled, on an enlarged scale, the St. George and the Dragon from a crown-piece. His father must have been an enlightened man; for, although his means were extremely narrow, he determined that his son should have an art education, and follow the bias of his taste. Accordingly, in 1822, the boy was articled to Behnes, then one of the most successful of portrait sculptors, and he remained for five years in the studio of that eccentric and dissipated artist, learning something of his profession by the light of a candle which he held to Behnes as he modelled, but much more by the light of nature. Behnes was a man thoroughly unfitted to prepare a young man for an honourable career; but Weekes picked up considerable technical knowledge while he was an apprentice, and became a regular student at the evening life-school of the Royal Academy. When his term of service with Behnes closed in 1827, Weekes shouldered his tools, knocked at the studio-door of Sir Francis Chantrey, and was at once admitted and given work to do. With this influential artist, the most popular sculptor of his age, the young man remained for fourteen years, gaining so thoroughly the confidence of his master that in his will Chantrey bequeathed to Weekes the completion of his unfinished works, the most flattering compliment which a sculptor can pay to a pupil. There can be little doubt that the prestige of Chantrey weighed heavily on the talent of Weekes, and it was more than a mere accident that made his statue of Dr. Corrie, Bishop of Madras, which was the first commission he executed after the death of Chantrey, a work of far greater artistic excellence than anything he had previously done. Towards the close of his life he showed that his great personal affection for Chantrey did not blind him entirely to the terrible limitations of that conventional and over-laboured school of which Chantrey was the most eminent and perhaps the worst representative. But there can be no doubt that the influence of that school, with its hopelessly prosaic traditions, did assert itself very hurtfully in checking the freshness and poetic fancy of Weekes's sculpture. He gradually, however, achieved a distinct, if not a very brilliant, success, and became widely admired as a portrait-sculptor of unusual intelligence and insight. His sentimental group called "The Suppliant," a work of little real merit, gained him his election as Associate of the Royal Academy in 1851, and in 1863 he became a full member.

The reputation of Weekes rests upon his admirable portrait-busts. There is no one now amongst us, unless it be Mr. Armstead, who has the bright and vivacious touch and learned eye of Weekes in comprehending the qualities of a fine head. But in what is called "ideal" work he was much less successful. His famous statue of John Hunter, seated with an open book upon his knee, is excellent as the very best things of Chantrey are excellent, prosaically and without fire. His portrait-statues are almost all of them feeble in the modelling of the legs, and of dubious anatomical value. The most spirited of his male figures, the "Sardanapalus," shows too much of this restricted study of the figure. Undoubtedly his masterpiece, unless his elaborate monument to Shelley at Christchurch be admitted to compete for the honour, is his statue of the Bishop of Madras above mentioned. This is an admirable work, worthy of any of the greatest names in English sculpture. The drapery is singularly well composed and modelled sharply in fine folds; the head of the Hindu boy on whom the prelate lays his hand contrasts well in its wild and startled expression with the Bishop's gravity and sweetness; while there is an absolute absence of that awkward rhetoric which Weekes picked up, probably in the studio of Behnes, and never, save in this instance, thoroughly divested himself of. His popular statue of the "Mother's Kiss" is an instance of the usual imperfection of his sculpture. The upper part is very finely conceived and executed, but the lower limbs are poor and conventional in the extreme. He suffered all his life from having been born into the worst age of British sculpture, and his delicate taste and poetic fancy were not strong enough to avoid those errors of style which his intelligence taught him to reprehend in others.

His labours on behalf of the neglected art of sculpture demand no less recognition from posterity than his best productions in that art. When he found himself in 1863 on the Council of the Royal Academy, he at once set to work to use all his influence in reviving an interest in sculpture, and in enlarging its endowment. He was successful in increasing the recognition of sculpture in the schools of the Royal Academy, and in stimulating the recognized heads of the profession to a greater zeal in the education of the students. He was conscious that sculpture had fallen into great disregard in England, partly through the lethargy of the public, but partly also through the inefficiency of those who stood at the head of the profession. He conceived that the general, no less than the technical, education of students had been neglected, to an extent which threatened to become fatal to plastic art in England. He was fond of quoting a saying of Baily's, that he owed his success to the fact that he had only been absent from the life-school one night during the whole time that he was admitted to that class as a student; and Weekes did no little service by earnestly instilling into the minds of young modellers the necessity of similar perseverance.

The most valuable of these lectures, in our opinion, is that on "Chantrey, Behnes, and Gibson." The lecturer dilates, with ad-

* *Lectures on Art delivered at the Royal Academy.* By Henry Weekes, R.A. With a Short Sketch of the Author's Life. London: Bickers & Sons.

mirable critical judgment, on the whole school of English sculpture as it existed in his own early manhood. We know no sketch of this period in art so careful, or marked by so much moderation and acumen. He traces, first of all, the decline of Flaxman's influence through Baily, Watson, and Macdowell, giving perhaps to the first too much, and to the last too little, praise, but, on the whole, defining their qualities with excellent taste. He then turns to the isolated figure of the elder Westmacott, and shows why such a man could leave no mark behind him. He then goes on to show how, in the exhaustion of the poetical school of Flaxman, there arose two men of great personal influence and strong prosaic talent, Behnes and Chantrey, and how they carried everything before them, leaving the school of ideal and antique fancy to rally around Gibson. That Weekes was able to say the whole truth in criticizing his master and dear friend Chantrey is more than we can affirm; but it is surprising with what skill he was able to distinguish what that very limited artist could do from what he could not do, and to write about his work with remarkable freedom from fatuity of applause. For the personal memory of Behnes he entertained no such affection, and here the excellence of his criticism is shown in the care with which he examines the awkward and antiquated work of this unlucky sculptor for what is really praiseworthy. He insists, with justice, that in his treatment of female beauty Behnes possessed a very distinct and rare gift of grace.

For Gibson Weekes had little sympathy, and indeed as little tolerance as was possible to so upright a nature. The introduction of colour into modern sculpture was a heresy to which he never bowed down for a moment at its most fashionable crisis. It was tiresome to him to be told that the Greeks had done a thing, and that therefore it must certainly be right, nor did he ever feel quite sure that Gibson himself understood the way in which the Greeks used colour. When Marochetti and Wyatt took up the new fashion and produced variegated works of sculpture, Weekes simply laughed at them in a good-natured way. It is now universally agreed that he was right, but his lecture on the subject may still be read with profit, for its healthy common sense and artistic feeling.

The volume is handsomely bound and printed, and adorned by some excellent photographs of Weekes's groups, and by a good portrait of the artist himself. We recommend the book to all who are interested in the progress of sculpture among us.

SIGNOR MONALDINI'S NIECE.*

NOVELS of Italian life have been plentiful of late years. In nearly all of them there is one figure which we may count on meeting. It represents the effect produced on the foreign feminine imagination by Italians of title. This figure is invariably the hero of the story. He is tall, dark, and statuesque. His manners are an irresistible compound of tender grace and calm dignity. He has the archæology of his country at his fingers' ends. Beneath a tranquil exterior lie unplumbed depths of ardour and passion. His lofty serenity captivates the people and overawes the middle class. He is in daily conference with Cardinals, Ministers, Ambassadors, and Royalty itself. He lives in dwellings vast and sumptuous, but distinguished by their faultless elegance no less than by their splendour. His thoughts and aspirations are noble; his comings and goings are sudden and mysterious; he is the loadstone of ladies and the envy of men. To those who are familiar with Italian society this picture may seem to belong to the region of an unlicensed fancy rather than of reality; but no tale of Italian life would now be complete, or, to most readers, would be either interesting or probable, without it. The present author, who certainly is much more familiar with the world described in this story than most who have tried their hands at it, cannot dispense with a character of this type; and Don Filippo, the hero of the tale, is merely a repetition of the heroes of nearly all previous stories of Italian life. The characters of the heroine and of several of the minor actors in the story show, however, much more originality and independent observation. In several cases they have the air of being drawn from life. We are inclined to think so as much on account of the defects in the drawing as of its merits. To the reader who is unfamiliar with the original, details and explanations are needed if he is to form a clear conception of a character. In *Signor Monaldini's Niece*, on the contrary, the writer seems to presuppose that the reader is already more or less acquainted with the personages described, and neither lets them show themselves fully by speech or action, nor makes up for this by any adequate amount of descriptive or analytical comment. This absence of the power of artistically presenting a character is, however, too common a defect, even in good novelists, for undue stress to be laid upon it. It is especially the defect of beginners in this class of literature, such as we take the present writer to be, though it is by no means always compensated by the merits in which this story abounds.

Signor Monaldini, a wealthy but untitled citizen of Rome, is the owner and part occupier of the Palace of the Naiad. There are besides himself several other dwellers in the house, as is the custom in Rome. The first floor, or *appartamento nobile*, is inhabited by Don Filippo, the hero of the story, a man whose birth, wealth, manners, and social world place him on an eminence to which the owner of the house looks up with deferential admiration. It is needless to say that the fact of living in the same house at Rome imposes no sort of obligation either to visit or even to greet on the staircase. The circle in which Don Filippo moves is, as was indicated above, the highest; that of the Monaldinis is the changing and gradually improving circle of an able and well-to-do member of the middle class, who is careful to weed his acquaintance of dubious elements and to replace them by others socially more eligible, in proportion as he prospers in the world and marries his daughters into families better than his own. An air of mystery hangs about the noble occupant of the first floor; his melancholy serenity bespeaks a heart at rest only because it has ceased to hope; his wife, whom he had married thoughtlessly, and whom he has always repented of marrying, is now insane. In fact, as we have already said, he is just the stock hero of all the novels which take Italian life as their subject. The heroine, Camilla de Montserrat, has, however, an individuality of her own. She is half Spanish by birth, and has lived the greater part of her life out of Italy, till the death of her parents forces her to accept the protection of her uncle at Rome. She is beautiful and high-spirited; and, in the opinion of her relations, her beauty renders the restraints which Italian manners impose on an unmarried girl all the more imperative, while her high spirit makes them appear to her all the more irksome and arbitrary. Innocent and ignorant of evil, she can see no reason for rules which to her are mere thraldom. She perplexes her relations by refusing offer after offer, however eligible, having made up her mind—not altogether in accordance with the custom of the country—that she will marry for love, and for love only. Her most persistent wooer, a Roman count named San Claudio, contents himself, after repeated rejections, with her cousin Carlotta, the daughter of Signor Monaldini. He marries her merely in order to be near Camilla, and his wounded pride is the cause of the catastrophe with which the story ends. Camilla finds a solace for the vexations which she has to undergo at home in the company of Mme. von Klenze, the occupant of another apartment in her uncle's house, who takes a fancy to the young girl, and plans a marriage between her and an American sculptor who is of the number of her *protégés*. Shrewd, selfish, clever, and worldly, but not without a vein of kindliness, Mme. von Klenze is one of a not uncommon type of persons, who, having lived the life of society, finally get tired of it, give it up, and set up for themselves outside the world they once belonged to, with a little knot of more or less dependent adherents, whom they alternately befriend and bully. Camilla is at first interested in the sculptor, Carlisle, who wins her approbation by browbeating her uncle in argument, and the scheme of Madame von Klenze might have been successful had it not been for the secret attraction which Camilla and Don Filippo exercised one upon the other from the day when their eyes first met. This mutual attraction strengthens as time goes on, and is fed by occasional meetings at Signor Monaldini's house, which Don Filippo enters for Camilla's sake, and elsewhere. There is all the while, however, the barrier of Don Filippo's former unlucky marriage between them, and, innocent as the relations of the two are, "the world"—that is to say, in this case, Camilla's own family circle—is by no means charitable in the construction which it puts upon them. Meanwhile, the charm which Don Filippo has for Camilla supplies constant food to the ferocious jealousy of San Claudio. At length the heat of summer drives everybody away from Rome, and Camilla receives an invitation from Mme. von Klenze to stay with her at her villa near Frascati. The visits paid here by the sculptor and Don Filippo bring matters to a crisis. Carlisle offers himself to Camilla, and is rejected. By this act, and by receiving the visits of Don Filippo, Camilla cuts herself off both from Mme. von Klenze and from her own family. Her uncle discards her with contumely, and Camilla feels that she is no longer welcome under Mme. von Klenze's roof. In her perplexity she hurries to Rome, and seeks for counsel from a Miss Conroy, an Englishwoman who formerly gave lessons in Rome, whom Camilla had befriended, and who is now living in affluence, ostensibly on the interest of a legacy which had been unexpectedly left to her. The interview between the two is by far the best scene in the book. In her days of friendlessness and poverty Miss Conroy had herself been tempted as it seemed that Camilla was now to be tempted. Miss Conroy tells her own story, and up to the last moment both Camilla and the reader are led to believe that it will be the narrative of the triumph of virtue over temptation. When Miss Conroy finally avows, without penitence, that the reverse is the case, Camilla flies from her in despair, and hurries back to the villa. The whole scene is very powerful. But the conclusion of the book, where the good people are made happy and the bad ones perish miserably, is a plunge into bathos. Camilla has an interview with Don Filippo in a cypress-grove, with a pool in it; and, while she and her lover are exchanging protestations of a virtuous and unchangeable attachment, a figure springs out of the darkness, throws Camilla into the water, and vanishes. The figure in question is San Claudio, who goes home and shoots himself. Don Filippo's insane wife suddenly and opportunely dies, and sets him free; and Camilla, just as the funeral rites are about to be performed over her, comes to life again, Don Filippo catches her in his arms, and the curtain falls upon an assembly of monks chanting a *Te Deum*.

On the whole, notwithstanding its absurd finale, this is a book

* *Signor Monaldini's Niece: a Novel of Italian Life.* London: Allen & Co.

that can be recommended more than the average of novels. It is throughout of unequal merit, but it abounds in admirable touches. There is a good deal of moonshiny sentiment in it, especially in the conversation of the lovers; but this is perhaps natural. Perhaps the best that can be said of it is that it makes hackneyed scenes and situations interesting, and that Roman life, about which so many cartloads of folly have been written, is presented in it with exceptional liveliness and fidelity.

AMERICAN LITERATURE.

THE most interesting, and perhaps the most valuable, of the American works that have this month reached us is an account of Captain Hall's second so-called Arctic Expedition (1), published under the orders of the Secretary of the Navy; one of those books printed, illustrated, and got up with total indifference to expense, for which the American public and the scientific world at large are indebted to the judicious liberality of Congress and of the Departments. Under an Act of the Federal Legislature the Naval Department purchased all the manuscripts of Captain Hall after his death for the sum of $15,000. Some of them have been already published, or employed in the narrative of the North Polar Expedition edited by the late Admiral Davis, and also published at the expense and under the authority of the Government. The present work, in some 650 quarto pages, very clearly and widely printed, contains the larger part of the materials left by its author; and details his experiences during the long period of five years and three months, from July 1864 to September 1869, spent on what he called appropriately an expedition rather than a voyage to King William's Land and the shores of Hudson's Bay, and a residence among the Innuits or Eskimos inhabiting that region. Arctic, perhaps, the expedition should hardly be called, since it scarcely passed the fringe of the region to which that name properly belongs. The climate, however, is as severe; and the hardships to be endured, apart from the inconveniences entailed by Captain Hall's scanty resources and dependence upon the natives, were as great as those suffered by many Arctic explorers much further to the north. The record of Captain Hall's adventures among the Eskimos, his sketches of the habits and temper, the ways, ideas, and traditions of this isolated race—who, excluded by the primary conditions of their life from almost all chance of civilization, yet can hardly be called savages—contain little that has not been observed and described almost as fully by previous explorers, if none have lived so completely among them or been so thoroughly adopted into their laborious and peaceful communities. Captain Hall's accounts throw little or no new light on the affinities of the Innuits, except as incidentally illustrating the utter absence of any near resemblance between them and their closest geographical neighbours, the aboriginal Indians of Canada and the States. It appears to be the best opinion, or that supported with more or less confidence by the highest authorities, that the Eskimos are really the last remnant of a race which occupied the greater part of Western Europe previous to the advent of the first wave of Aryan immigration—a remnant gradually driven by a more powerful and more warlike people to take refuge in the most inaccessible extremities of their world. But neither their employments, their habits, nor even their laws and their few traditions and superstitions, seem to afford any clue to the character and progress of the supposed aborigines of the European continent. Even the most notable peculiarity of the Innuit, his exceedingly pacific temper, the aversion of the tribes to war and of individuals to violence, may well be due to conditions of existence under which human life is too precious to be wasted; since the limited number of each community, and indeed of the whole race, renders each man of value, and their scanty possessions afford no temptation to aggression for the sake of plunder; while the vast extent of their comparatively barren hunting-grounds has probably prevented that collision in pursuit of game which among other hunting races is perhaps the most frequent source or pretext of quarrel.

General Norton's elaborate and apparently very complete monograph on American ordnance and small-arms (2) has much technical and practical interest. Perhaps in no department of invention has progress of late years been so rapid as in this branch of the art of destruction; to no subject has so large a part of the inventive ingenuity of mankind been directed, and in none has the advance been so continuous or so great. But America has more than kept pace with Europe, wonderful as have been the achievements of inventors on this side the Atlantic. Within the memory of men who have scarcely passed middle life the old musket was still the chief military weapon of civilized nations. Men who saw the Enfield introduced for the first time among our troops have lived, while still in the prime of manhood and on active service, to see it succeeded by rifles which will kill and can be aimed with almost absolute accuracy at a distance at which the human figure is scarcely distinguishable. Those in whose youth the 68-pounder was considered an exceedingly heavy siege piece are now manipulating artillery beside which it seems a mere pop-gun. The difficulty of those who are responsible for the armament of nations is to keep pace practically with the progress of invention, to decide between hundreds of different pieces, each of which has its special advantages and disadvantages, upon which the issue of a battle, perhaps of a war, may depend. But perhaps the most remarkable achievement of recent years, and that which may affect even more than we can yet conceive the character of the next great international struggle, is the invention, or rather the perfection, of repeating or multiple fire; of small-arms which will discharge from six to thirty bullets without the necessity of reloading; and of light pieces of artillery which in the hands of three or four men will deliver a fire far more terrible than that of the most destructive battery of grape or shrapnel, without intermission, for an almost indefinite time. General Newton gives what seems to be a full, and what evidently aims at being an impartial, account of all the most successful or most promising recent inventions, and of some of those more primitive attempts which, if now completely superseded, yet deserve the higher credit as having indicated and opened the way to the results of the present.

Under the pseudonym of "Junius" (3), a writer, evidently familiar with the practical manipulation of American political machinery, vindicates at some length what he calls the "Independent Movement" among the Republican party in the State of New York; the revolt of the more thoughtful and respectable elements of the party from the control of its "regular" managers —of those who, in technical phrase, "run the machine." How, and for whose interest, the machine is run, how it is constructed, and what are its motive powers, the writer explains in much detail with every appearance of accurate personal knowledge, and, in so far as we are able to follow and check his statements, correctly. We cordially recommend the book to the President of the Board of Trade, and to his assistants in the work of introducing the American Caucus system into English politics. The admirers of that system may learn from these pages to what the Caucus inevitably comes. Even where the original arrangements are fair and loyal, it is scarcely possible that the control of the machine should not ultimately pass into the hands of professional politicians who make electioneering a business, and of course intend to make their profit thereby. The great body of citizens cannot possibly give their attention year by year and month by month to the work of organization; and this and the vast power it bestows must therefore fall either, as has hitherto been the case in England, into the hands of a few men of fortune, leisure, and character, or into those of a somewhat larger number of men who, giving their time and energies to the work, must in one form or other be well paid for their services. The right which some one must exercise of deciding who are or are not good and true Republicans or Radicals entitled to vote at the preliminary or ward elections of Republican or Radical delegates, affords in skilful hands a means of excluding all independent and self-respecting members of the party, and securing the control of the professional electioneerers and their willing tools. This is so completely the case in New York, and we believe in most Northern States, especially in the great cities, that the choice of decent and reputable Republicans lies between the abnegation of their party principles and the abnegation of political integrity. As yet party feeling has run so high that the great body of that party prefer to cast their votes for men known to be politically disreputable, and in many cases personally dishonest, rather than to allow the election of an opponent. So long as this feeling prevails, it follows, we fear, that the Independent movement can be of little effect, and the hopes of Junius are doomed to disappointment. So long as, whatever they may threaten, the Independents, at every critical moment, vote steadfastly for the nominee of their party, be he who and what he may, their discontent, however strongly expressed, is simply disregarded, and their revolt only excludes them the more hopelessly from all influence in the selection of the candidates whom, nevertheless, they find themselves at last compelled to support.

A new edition of *The American Farmers' Handbook* (4) is in many respects incidentally suggestive and instructive. The cheap and popular character of the work suggests the immense numerical importance of the class to whom it is addressed, and, together with its contents, proves their freedom from the stolid practical conservatism, the indifference to literary or scientific guidance with which their English competitors are sometimes charged.

Mr. Steele's *Canoe and Camera* (5) is one of those numerous holiday books which illustrate a peculiarity of American life; the facility with which in a country so vast, so imperfectly settled, and yet so universally intersected by railways and navigable rivers, men of business—even the busiest—can at no sensible cost of money and at little loss of time, make their way to regions almost utterly wild, and there enjoy sport compared to which the best Highland deer-shooting or Norwegian salmon-fishing is dull and tame, without paying rent to any owner of moor or forest, and without fear of any game-law. The records of such excursions must move the envy of thousands of English readers, and

probably stir the emulation of a yet larger number of American men and youths, in whom the hard work of life has not yet extinguished the power of delighting in holidays.

Mr. Northend, in his Life of Elihu Burritt (6), perhaps exaggerates Mr. Burritt's services to the cause of cheap ocean postage, but they were doubtless considerable. Unfortunately this is in the biographer's, as in the eminent blacksmith's own esteem, a secondary merit. Elihu Burritt's chief object in life, the great enthusiasm that inspired and possessed him from his first entry on a public career almost to his last public utterance, was that of the peacemonger. But the chief interest of Mr. Burritt's biography, as of his life, lies wholly apart from his opinions and his political career; it lies in the labours by which that career was rendered possible, in the earnest, persistent efforts which made the blacksmith's boy a scholar and an orator; in the good taste, good feeling, and literary power which are evinced in all the narrative and descriptive passages from his writings which are appended to this biography, and which breathe a spirit of international goodwill and social kindliness very different from that which has animated the public career of most of Elihu Burritt's especial friends and allies.

Under a biographical title Mr. G. W. Grote presents to the youth of America a series of sensible, if somewhat prosy, lessons on the art of rising in life, especially through a merchant's office (7). We have no doubt that all his advice is as good as most of it is old. Whether it will find many readers, or whether many of those who may read it are likely to profit by it more than by the very similar advice they are sure to have received orally from their friends and elders, is altogether another question.

Mr. Cox's treatise on Free Land and Free-trade (8) contains a strange mixture of sound reasoning and sheer nonsense, of economic sarcasm and political abuse. We might perhaps sum up its merits and defects by saying that most of the author's counsels to his countrymen are tolerably sound, while most of his criticisms on the order of English society are perversely untrue, as well as needlessly and unjustifiably aggressive.

Mr. White's elaborate treatise on Everyday English (9) contains much practical sense and a good deal of exaggerated pedantry, dealing at somewhat extravagant length with the general principles and particular errors affecting the ordinary speech of ordinary Englishmen and Americans. A tiny and very unpretentious volume entitled *The Faults of Speech* (10), by Mr. A. M. Bell, will perhaps be of more actual service to those afflicted with the nervous or organic defects, to which the author attributes the stammering and other difficulties of pronunciation with which he deals.

In his *Boston Monday Lectures* on Socialism (11) Mr. Cook draws rather a contrast than a distinction between Socialism as a system invoking the aid of the State to confiscate by taxation or otherwise the property of the rich for the benefit of the poor, and co-operation as a practical scheme whereby the resources of the poor, and indeed of all society, except perhaps the wealthier class of capitalists and the dullest class of labourers, may be employed to amend and elevate the condition of all. He points out with some force that whatever freedom of utterance and apparent favour the former may find in American lecture halls and on political platforms, the States are the last country in which revolutionary Socialism can have a chance.

Among the fictions before us Mr. W. D. Howell's *Undiscovered Country* (12) merits particular notice, inasmuch as its interest turns on what is a complete novelty, at least among novelists—the experiences of an honest but deluded professor of Spiritualism. Miss Perry's collection of short tales takes its title from the first (13), which, however, does not fulfil the anticipation which the title suggests. *Alva Vine* (14) and *A Hopeless Case* (15) are tales of no very extraordinary American type.

Mr. Eugene Munday's *Cabinet Poems* (16) are printed with an ostentatious brilliance of margin, excellence of paper, and elaborate decoration, which fail to make up entirely for the want of any special merit in the poems themselves.

THE CANDAHAR DISASTER.

BEFORE the arrival of the message which was received at the India Office on Wednesday it had become evident that a struggle for the possession of Candahar and the neighbouring province was impending. More than a week ago a part of the WALI'S troops deserted their standard to join the force which has been slowly advancing under AYUB KHAN from Herat. The mutineers were pursued and dispersed by a detachment of General BURROWS'S force, and it was thought that many of the survivors would take the opportunity of returning to their homes. The latest movements of the English General are still imperfectly known; but, whether he was surprised or overpowered, with full notice of the strength of the enemy, he can scarcely be acquitted of want of skill, unless indeed his troops were seized with a panic, or unless the native cavalry mutinied in the presence of the enemy. The citadel of Candahar into which General PRIMROSE has since retreated ought to be tenable for a time against any native army. Too little attention has been paid by English commentators on Afghan affairs to the movements of AYUB and the regiments which followed him from Herat. The boldness of the enterprise proved the confidence of the leader, or perhaps of the military chiefs around him, in the strength and discipline of the force which was supposed to have been occupied with domestic quarrels. The troops from Cabul and the indigenous soldiery of Herat have in some way patched up their feud; and they have found means of subsistence during their long march on Candahar. They probably assured themselves of support from the country they invaded; and it is not unlikely that by this time they may have been reinforced by the whole of the WALI'S troops.

Twice within a year and a half English troops have suffered serious defeats for which there had been no precedent since the destruction of ELPHINSTONE'S army in the first retreat from Cabul. The last misfortune recalls the memory of Isandlana; and its effects are likely to be more serious. The English advance into Zululand was then delayed for several weeks; but the enemy made no attempt to follow up the victory, and ultimate success was from the first absolutely certain. The calamity which has now occurred may probably have wide political consequences, including the necessity of retrieving at any cost the military reputation which has been grievously compromised. The Indian Government would probably have determined on the evacuation of Candahar, though, as Lord HARTINGTON said on Tuesday, the disposal of the city and territory formed no part of the arrangement with ABDURRAHMAN. Retirement will now be more difficult, if indeed Candahar is still in English possession; and it is possible that AYUB may become a formidable competitor for the throne of Cabul. An Ameer who is forced to dispense with the possession of Herat and Candahar can scarcely hope to be permanently acknowledged as a national ruler. At present it is impossible to calculate all the political results which may follow from the defeat of General BURROWS. The only definite advantage which had been secured in a long war or succession of wars was the establishment of a belief in English military superiority, which had been rudely disturbed by the events of the last Afghan war, including the immediate retreat of the invading army after the second occupation of Cabul. General ROBERTS and General STEWART had repeatedly defeated superior Afghan forces, and it was believed on both sides that any further contest would have a similar issue. The recent disaster will destroy for the time the wholesome impression which had been produced. The success of an Afghan force will be reported with exaggeration throughout the country, and it is even possible that Sir DONALD STEWART may be compelled to fight once more for the possession of Cabul. Even if ABDURRAHMAN and his supporters have the good sense to abide by the settlement which has lately been effected, his own position will be seriously affected by the success of his kinsman and rival.

The arrival of ABDURRAHMAN in Turkestan was certainly not intended by his Russian patrons to provide a comparatively tolerable solution for the perplexities of English policy; but, on the whole, Lord LYTTON seems to have been well advised in profiting by an unexpected opportunity. The son of the eldest son of DOST MAHOMED had as plausible a hereditary claim to the succession as any other member of the BARUKZYE family; and ABDURRAHMAN had, before the establishment of SHERE ALI'S power, fought and negotiated with ability and vigour. It is probable that, during his long residence in Russian territory, he may have increased his political knowledge; and it appears that he has not, like many Asiatic princes in similar circumstances, sunk into habits of dissipation. If late reports can be trusted, ABDURRAHMAN is temperate in his habits, and he transacts business in person, instead of relying on Ministers and favourites. It would be rash to rely on his gratitude for offers which, as he well knows, are not wholly disinterested; but his friendship may perhaps be earned by liberal treatment, and especially by impressing him with the just conviction that he has more to hope from the Government of India than from any other ally. There has been, as Lord HARTINGTON states, some difference of opinion among Lord RIPON'S advisers on the expediency of recognizing ABDURRAHMAN as Ameer; but the English Government is satisfied with the final decision of the VICEROY, and probably the objections to any rival candidate might have been equally strong, and they would have been of the same nature.

Lord HARTINGTON judged rightly in speaking, even before the news of the disaster had arrived, of the Afghan settlement as provisional and incomplete. The later policy of Lord LYTTON continued by Lord RIPON seems to have been judicious; but the embarrassments which still remain illustrate the risk of the original enterprise. The attack on Ali Musjid, which caused the flight of SHERE ALI from his capital, began a period of uncertainty, and even of anarchy, which may yet last for an indefinite time. Other events have happened in a sequence which could probably not have been interrupted. The Indian Government could not be blamed for recognizing the competence of YAKOOB to represent the nation and the dynasty in concluding the Treaty of Gundamuk. The policy of insisting on the reception of an English Envoy at Cabul was more disputable; but there can be little doubt that in any circumstances the treaty would have been broken. The advance on Cabul after the murder of CAVAGNARI was inevitable; and there has since been no convenient opportunity of retiring from Afghanistan. The representative of the VICEROY had to find some ruler with whom it was possible to treat; and YAKOOB had unfortunately rendered his restoration to power impossible. The chieftains who had his young son under their con-

trol possessed neither the rank nor the influence which could entitle them to claim supremacy in his name. It may be added that hostile attempts were incessantly renewed; and that until lately the fortress of Ghuznee was occupied by insurgents or enemies. A negotiation with a military adventurer such as MOHAMED JAN, and a consequent retreat from the country, would have been not unreasonably regarded by the Afghans as an acknowledgment of defeat. Unfortunately it is but too probable that the disaster at Candahar will cause a renewal of hostilities in all parts of Afghanistan. The deepest anxiety will be felt until it is known whether General PHAYRE has been able to relieve General BURROWS and the garrison. The exaggerated account which was first sent by General PRIMROSE has been corrected; but enough remains to make political as well as military calculations for the present worthless. If AYUB KHAN succeeds in improving his victory, he will perhaps be able to establish his power in Cabul as well as in Herat and Candahar; but the substitution of one candidate for another would be a matter of trifling importance in comparison with the graver consequences of the overthrow of English influence in Afghanistan. In the more probable event of the final defeat of AYUB, the chief competitor with ABDURRAHMAN will be no longer formidable.

THE HARES AND RABBITS BILL.

THE first act of the Government play, *The School for Communists*, having as far as the House of Commons is concerned, had the curtain dropped upon it, the curtain as naturally rose again last Thursday upon the second act. There was indeed a time when the Hares and Rabbits Bill was designed by the playwright to fill the whole of the drama for the period of the present Session. But Mr. FORSTER'S afterthought, assisted by Mr. PARNELL and Mr. O'CONNOR POWER, took sudden shape in the Compensation for Disturbance (Ireland) Bill, and the HOME SECRETARY and his hares and rabbits had to lurk in the background. There they have lurked for nearly two months, while the intrusive measure has tested the fidelity of Mr. GLADSTONE'S carpet-baggers. The elect of the Hundreds will not have so severe a strain put on them by the Hares and Rabbits Bill. For, while the utter un-equity—iniquity is perhaps rather a question-begging, though not an inappropriate, term—of the Irish Bill has startled even those who do not own land, the Hares and Rabbits proposal has a certain specious air of kinship with the anti-Game-law measure which has always formed part of the Radical platform, and appeals to the healthy hatred of those who are *satis beati ruris honoribus*, which Radical townsmen always feel. On the other hand, it is by no means certain that some at least of those Liberal land-owners who, with a very liberal interpretation of ancient precepts, have borne the spoiling of other people's goods quietly, seeing that they themselves have no Irish property, may not be a little touchy now that the question is one affecting themselves directly, and in a quarter where they feel quite as keenly as the most benighted of their Tory neighbours. If, therefore, the problem were merely one dealing with the limits of subserviency of a Radical majority, the present measure would supply an interesting variation to the previous instance of the Irish Compensation Bill. But, as it happens, its interest is by no means limited to this.

During its long period of occultation the Bill has been, as was natural, less attended to than more prominent measures; but it has nevertheless served as an occasion for eliciting from all sorts of people some very curious expressions of opinion. The tenant-farmers as a rule appear, as was to be expected, to be not dissatisfied with it; and the owners of land, as was also to be expected, to be very much dissatisfied. The excellent reason which the latter have for this dissatisfaction was manifested in a dramatic fashion by an announcement made immediately after the introduction of the Bill. It was said that Mr. CHAPLIN had disposed of his shooting rights in Lincolnshire to his tenants at the rate of a shilling an acre, the transaction increasing his rents by something over a thousand a year. We presume that the Bill, if carried in its entirety, would make such bargains void in future, or would at least deprive the landlord of the power of enforcing them, and a calculation of the acreage of England, apart from moors and wastes, will show that by this Bill a good many millions annually are forcibly taken out of the pockets of one class and put into the pockets of another. It is not to be wondered at, therefore, that all sorts of arguments have been used against the measure, arguments which perhaps culminated in Lord STAMFORD'S fear that the workers in the mining districts would lose their favourite Sunday dinner in consequence of the certain extinction of the race of rabbits, and in the still more pathetic plea put forward elsewhere as to the Sunday, and indeed weekday, dinner of foxes. With respect to this argument, it will probably strike not a few persons that foxes are capable of taking care of themselves, and are not at all unlikely to exact poetical justice from the tenant-farmer by levying double taxes on his poultry yard. A chicken is, after all, either for man or fox not a bad substitute for a rabbit. Politically the proposal has also acted in a curious way. During the former discussion of the Bill member after member of the purest Liberal faith rose to give notice of antagonistic motions and amendments, and it was perfectly obvious that, both from personal feelings and from objections to the interference with public contract which the Bill implies, they would certainly not be without followers on their own side of the House. So threatening indeed was the prospect that it seemed at one time as if the Government would not be averse to availing themselves of some pretext for dropping the measure or letting it be stranded on one of the numerous Parliamentary shoals which lie about for all measures half-heartedly or unskilfully piloted. Then a strange rumour got abroad to the effect that, while Liberals were thus mutinying, not a few Conservative county members had determined to support the Bill, evidently as a sop to their constituents, and to deter them from repeating or exaggerating the defection which returned in April so many Liberals for unhoped-for seats. So that, on the whole, the chances of the measure when it at last came on for serious discussion were of a highly speculative kind. Even the tenant-farmers are supposed to regard it, as Sir STAFFORD NORTHCOTE says they regard the commutation of the Malt-tax, as an attention rather than a substantial benefit, and the different circumstances of different parts of the country gave ample occasion for special and local objections.

When the debate actually came on, this complication of interests and arguments was fully represented. Not a little time indeed was uselessly taken up on Thursday night because Mr. GLADSTONE, in one of the incomprehensible fits of obstinacy which not unfrequently come upon him, refused for something more than an hour the very reasonable demand for an adjournment. The reasonableness of that demand is evident from the facts already mentioned. When there is so great a divergence of opinion, and when there are so many different interests to be represented, it is especially desirable that the fullest opportunity of expressing them should be given. And, as a matter of fact, the speeches on Thursday were almost all of a more or less instructive kind, as exhibiting fresh sides of a many-sided question. No one contended that hares and rabbits were not sometimes by accident, sometimes by the injudicious conduct of individuals, capable of becoming serious nuisances. But at this point agreement may be said to have ceased, and it is somewhat remarkable that the most decided support given to the HOME SECRETARY'S Bill came from a political opponent, Mr. RODWELL, who was apparently guided by the wishes of the tenant-farmers rather than by any affection for the measure itself. Now the wishes of the tenant-farmers, like the wishes of all other classes, no doubt deserve respectful consideration; but it does not follow that those wishes, even if they were much more clearly expressed than they have been, are a sufficient basis for legislation, especially for legislation of so singular a kind. No speaker on Thursday succeeded in making out anything like parallel or precedent for this remarkable interference with freedom of contract, and for the still more remarkable creation of inalienable rights. It was very well pointed out that all similar interferences of moment which the Legislature has made have been either in favour of those who are practically unable to help themselves, or else have been directed immediately to the saving of human life. The interference proposed by the Hares and Rabbits Bill cannot by any ingenuity be brought under either category; and it is exposed to a number of weighty objections peculiar to itself. It not only does not touch the principle of the Game-laws, but it may be said to create a new vested interest in those laws, by virtue of the inalienable right lodged in the sacred person of the

occupier. Hence it cannot be logically supported by Mr. Peter Taylor's followers. It does nothing whatever for that curious pet of certain philanthropists, the sporting labourer. Hence it ought to be vetoed by the disciples of Mr. Arch. It establishes a system of concurrent, not to say clashing, rights which must infallibly create bad blood between landlord and tenant. It initiates in favour of the latter the mischievous theory of the occupier's property in his holding, which is already bearing fruit for all men to see and taste in Ireland. If its operation might in some cases prevent over-preserving and wanton slaughter, it would in a very much larger number of cases interfere with not the least deserving class of sportsmen—those who, unable to spend their whole time in the country, seek rest and relaxation in the renting of shooting rights. It tends, in the opinion of many of the very best judges, to the extirpation of hares and rabbits altogether; and though Mr. A. Elliot is reported to have said that the people of England could get on very well without hares and rabbits, this argument is not to be too implicitly accepted. The people of England could, it may be suggested, get on very well without Mr. A. Elliot, yet no one would for this reason advocate the forcible extinction of a gentleman who is doubtless an ornament to society and to Parliament. In short, it may be doubted whether a measure has ever been introduced more liable to objection from this side and from that than the present Bill. To all such objections ample consideration is due, and therefore Mr. Gladstone's attempt to force a division by his now usual method of threatening the House was as indefensible as it was indecent.

TURKEY.

No change has taken place in Eastern affairs, except that the prospect of a naval expedition is becoming more definite. It is now stated that each of the Great Powers will contribute two vessels to the formation of a squadron, which is probably to be commanded by Admiral Seymour. The purpose of the operation is still mysterious. As it is expressly stated that no troops are to be embarked, it seems at first sight to follow that the Turks and Albanians will not be seriously molested if they decline to obey the commands of the European Governments. It is highly improbable that the combined fleet will engage in the doubtful enterprise of forcing the passage of the Dardanelles, where the defences have been recently repaired and strengthened. The Turkish fleet will not be rash enough to incur certain defeat by encountering the combined fleet. The Commander-in-Chief, Admiral Hobart, must of course resign his commission as soon as his own country is at war with Turkey. It is announced that the first demand to be enforced will be the surrender to Montenegro of the territory which was stipulated in the compromise negotiated by Count Corti. The Sultan, if he declines to yield, will urge in vain the difficulty of ensuring the obedience of the Albanians, who are, with good reason, believed to be executing his commands or wishes. It is thought that the appearance of the allied fleet on the Albanian coast will convince the tribes as well as the Turkish Government that the Powers are at last in earnest. The malcontents may perhaps not be aware that, in default of troops to be landed, the ships are powerless to molest them except within reach of their guns. Their more prudent leaders may also infer from the so-called demonstration the probability that further measures will be taken if compliance is obstinately refused. The Montenegrins have already received a pecuniary subsidy from Russia, and probably they are assisted by Russian officers. It is not known that similar assistance has been given or promised by any Power to Greece; but the Greeks are continuing their armaments. It may be assumed that they will not provoke certain defeat by entering the disputed territory on the Eastern side. The Albanians would in their own country probably be more than a match for any Greek invading force; and the Turkish army would, if its aid were required, easily crush a weak and undisciplined enemy. There might perhaps be a better chance of success in Thessaly, where nearly the whole population is Greek in race and language; but, if the Turks can spare any considerable force to defend the province, they will probably not be attacked.

The only reason for hoping that the Sultan will yield consists in the probable conclusion that the European Powers cannot have entered into a formal compact to make themselves ridiculous. The Ministers of the different States must know as well as their irresponsible critics that a naval force which will neither engage in hostilities by sea nor convey troops to act on land would fail to frighten adversaries much more timid than the Turks. It may therefore be taken for granted either that they have cause to rely on the eventual pliability of the Sultan, or that they are prepared to employ more stringent methods of compelling submission. If the temporary league or coalition which has been formed were directed by Mr. Gladstone, it might perhaps share his favourite illusion that the Porte will never resist the verbal dictation of Europe. He is probably justified in the belief that a common declaration of war, or even the exaction of some material guarantee, would produce the desired effect; but Mr. Gladstone only shares in the control of English policy; and probably the prudence and experience of Lord Granville may be used to guard him from the consequences of his own imperfect knowledge and sentimental precipitancy. The other Powers, with the exception of Russia, are not enthusiastic partisans of Montenegro, and none of them appear to meditate any sacrifices for the sake of Greece. The French Government indeed has sometimes professed sympathy with the Greek cause; but its organs consistently protest against any participation in measures which might involve the country in an unprofitable war. The alliance of Germany with Austria, which seems every day to become closer, renders hostile operations against Turkey on the part of either Power in the highest degree improbable. Italy will not act alone; but, if the occasion arises, it will probably co-operate with Russia. The well-known saying that it is necessary to understand a paradox before regarding it as a simple blunder applies to Governments as well as to private persons. The able newspaper Correspondents who accumulate authorities to prove that there is no real union among the Powers fail to account for the naval demonstration which can only be explained by their political concert. The unanimity of the Plenipotentiaries at the late Berlin Conference suggests the same obvious inference. The zeal of the English Government may perhaps be intelligible; but the French, the German, and the Austrian Governments would scarcely have addressed a peremptory demand to the Porte if they had been prepared to acquiesce in an obstinate refusal. Still less would they have allowed their flags to be used for the purpose of empty menace.

The despatch of a combined fleet to the eastern shores of the Adriatic will, in the first instance, be so conducted as not to amount to an act of war; but, if the first movement proves to be useless, it will be necessary for some at least of the Powers to proceed to more practical measures. By common consent Continental politicians award to England the duty of enforcing the decisions of the Conference. Of Russia, which, at least in the case of Montenegro, is much more likely to interfere, it is not deemed expedient to speak so openly. Some of the English journalists who are especially devoted to Mr. Gladstone have urged him to the discharge of a supposed duty which may perhaps be honourable and which is certainly perilous. Sir Wilfrid Lawson in the debate on Armenia frankly expressed the surprise which many of Mr. Gladstone's followers would feel if it appeared that his too fervid sympathies had induced him to engage in an unprovoked and unnecessary war. They would perhaps not share the opinion which was hastily expressed by Sir Wilfrid Lawson that the objects of Mr. Gladstone's Quixotic benevolence were the greatest scoundrels on the face of the earth; but they would narrowly scrutinize the claims of the Greeks to territorial aggrandizement, obtained by the sacrifice of English money and English life. In some other cases the present Government may plausibly contend that its dangers and misfortunes are the inevitable consequence of the mistakes of the former Ministry; but a war with Turkey could only begin with a deliberate reversal of Lord Beaconsfield's policy. He and Lord Salisbury, though they have often been blamed for not showing sufficient energy in asserting the claims of Greece, will probably receive credit for not having engaged in even a naval demonstration against Turkey. A stronger feeling of indignation against their successors would be aroused if they were suspected of a separate and offensive alliance with Russia. A Greek and Montenegrin war against Turkey, coinciding with a Bulgarian insurrection, would be universally unpopular in England,

except among Mr. GLADSTONE's extreme and unqualified adherents. His own devotion to peace is so well known that he will probably shrink at the last moment from the logical consequence of his naval demonstration. It is on every ground desirable that the European concert should be maintained as long as possible. It would have had a better chance of permanence if Mr. GLADSTONE had not wantonly irritated Austria, and consequently incurred the risk of differences with Germany. The rude phrase of "Hands off" was, as Mr. GLADSTONE's apologists strenuously contended, more deliberately repeated in his notorious letter to Count KAROLYI. He then professed to be satisfied with the assurance that Austria entertained no ambitious designs of extending her dominions towards the Ægean. It is not impossible that the scheme to which he referred may form a part of Prince BISMARCK's Eastern policy. It may be repeated that the principal ground for confidence in the united Powers is founded on the apparent inefficiency of a measure which therefore may have some purpose or excuse not visible on the surface of things.

THE IRISH DISTURBANCE BILL.

THE objections to the Irish Disturbance Bill have lost none of their force; and the repugnance with which it is regarded has rather increased than diminished; but in the later debates the opponents have found that resistance was useless. The inchoate secession was not likely to be completed on the first divergence of opinion and principle; but the Whig members who have refused to support the Bill have sufficiently shown to the Government the necessity of choosing between extreme and moderate partisans. They cannot have expected that the Bill would be abandoned in deference to their scruples; but their silent or open protest may exercise a possible influence on Mr. GLADSTONE's future policy. In the present instance his conduct has been characterized by rashness and haste rather than by deliberate preference of revolutionary doctrines. It is impossible that Mr. FORSTER can have consciously introduced the most dangerous of modern legislative measures in the form of a clause suddenly inserted into a Bill which was otherwise unopposed. The repeated changes which have been proposed and withdrawn with little final change in the structure of the Bill afford an additional proof of the carelessness with which it was originally promoted. Mr. GLADSTONE, who deserves credit for the command of temper he has displayed during the Session, has taken the most judicious course for the purpose of conciliating opposition by consistent assertions of the comparative unimportance of a Bill narrowly limited in time and not extending over more than half Ireland. He has perhaps been startled and annoyed by the praise which he has received from partisans less reticent than himself. Mr. RYLANDS approved of the measure, not because it is moderate and comparatively harmless, but as a precedent for the transfer of proprietary rights from the landlord to the tenant, and for other forms of future spoliation of the same unfortunate class. Colonel KINGSCOTE and other members naturally inquired whether the Government concurred in the opinion of its too candid adherent. The question was justified by more than one imprudent phrase of Mr. FORSTER's, though he declined responsibility for the extravagances of Mr. RYLANDS. The dullest and most commonplace intellects are sometimes the most accurate interpreters of ambiguous policy. They at once form the conclusion that an obvious violation of justice is not destined to be a trivial or a solitary anomaly.

More sagacious apologists, though they may probably agree with Mr. RYLANDS, have taken a hint from the ostentatious moderation of Mr. GLADSTONE. The same writer who lately declared that a plutocratic Assembly must be reformed if democratic measures were to be passed has of late endeavoured to reclaim frightened seceders by reminding them that Lord HARTINGTON, Lord KIMBERLEY, and Lord SPENCER are still members of the Government. A fortnight ago the new Parliament was said to have commenced a new era; but it now seems that the Irish Disturbance Bill is an ordinary administrative proceeding rather than a measure which establishes new principles of legislation. Sir CHARLES TREVELYAN, who justly classes the Disturbance Bill with the Hares and Rabbits Bill as an attack on the principle of property in land, is mildly assured that Mr. FORSTER only guards against the wrongs which might be committed by a small minority of arbitrary landlords. It might be said in answer that it could not be right to disturb the foundations of property for the purpose of correcting a few isolated cases of hardship. The Ministers who have almost alone taken part in the conduct of the measure have never taken the trouble to ascertain or to state the magnitude of the alleged evil for which they provide a violent remedy. The outrageous statistics which were exploded by Lord GEORGE HAMILTON have neither been defended nor disclaimed; and perhaps Mr. FORSTER's 3,400 policemen may still be crossing and recrossing the stage of his imagination. The Irish ATTORNEY-GENERAL calmly accepted Mr. GIBSON's statement that nearly all the cruel and evicting landlords had allowed their tenants to run into arrear for two years' rent. They are to be rewarded by a further postponement for two or three years of payment of their undisputed claims.

The principal speeches in the debate on the third reading were those of Mr. FORSTER and Mr. GLADSTONE for the Bill, and of Mr. TOTTENHAM and Mr. CLARKE against it. Mr. TOTTENHAM's exposure of the statistical blunders of the Government were not less complete than Lord GEORGE HAMILTON's; and Mr. CLARKE analysed with considerable success some of the fallacious figures which have furnished rather an apology than a motive for the Bill. He also answered with much force Mr. FORSTER's boast that the Bill, as it leaves the House of Commons, differs but little from the original draft. The Government in various stages of the discussion consented to more than one mitigation of the injustice inflicted on landlords; but they were forced by Mr. PARNELL and his followers both to abandon the Irish ATTORNEY-GENERAL's amendment, and to raise the limit of suspension of rent from 30*l.* to 45*l.* In answer to Mr. TOTTENHAM, who had proved that the scheduled districts were not even approximately coincident with the area subject to distress, Mr. GLADSTONE boldly asserted that the primary object of the Bill was not to relieve distress, but to prevent anarchy, which he described as approaching within a measurable distance of civil war. He forgot that the measure which has caused so much alarm was originally introduced as a clause in the Bill for the relief of distress. Mr. FORSTER may be acquitted of any intention to smuggle an important enactment through the House; but he evidently believed at the time that little opposition would be offered to the suspension of rents if it was proposed with direct and exclusive reference to the failure of recent harvests. Mr. GLADSTONE is not justified in shifting the responsibility from himself to the Opposition, or in declaring that the rejection of the Bill will excite grave discontent in Ireland by reason of hopes which correspond to the fears of those who deprecate the measure. It may be well to take note of Mr. GLADSTONE's repeated statements that the Bill has been so framed as to afford no precedent for future legislation. No political innovation ends with itself; and a temporary disturbance of the rights of landlords evidently impairs the security of property. There is too much reason to fear that Mr. GLADSTONE may hereafter discover in the present Bill the germs of more comprehensive legislation. On a balance of evils it may be doubtful whether the House of Lords will be well advised in rejecting the Bill. The danger which may result from an adverse decision must be exclusively attributed to the authors of the Bill.

Except in the speeches of Mr. GLADSTONE and Mr. FORSTER, there is a general consent of opinion among friends and enemies as to the gravity of the measure. Sir JOHN RAMSDEN expressed the reluctance of moderate Liberals to abandon their leader, and the urgency of the reasons which induced them to protest against spoliation. Mr. SHAW-LEFEVRE, the only member of the Government except the Irish SECRETARY and the PRIME MINISTER who took part in the final debate, could not, even at the risk of injury to the cause which he defended, refrain from propounding the revolutionary theory that the right to rent ought to be dependent on the goodness of crops. In France or in Germany, as he asserted, a bad harvest exempted the tenant from payment of rent; and he inferred that the same immunity ought to extend to Ireland and to England. Although the exact operation of the custom of which Mr. LEFEVRE spoke has been disputed, that custom evidently regulates the relation of landlord and tenant, and constitutes the contract between them.

Even a modern theorist on land will scarcely assert that the bargain between the English landowner and the tenant farmer is dependent on the contingency of the seasons; but the argument is significant, as it implies Mr. Lefevre's well-founded belief that the Disturbance Bill is an infringement of the rights of property. The Irish agitators on their part, and the advocates of extreme radicalism in the press, are under no illusion as to the importance of the precedent which has been established. The malcontent Whigs are openly warned that they will be thrust aside if they venture to resist the current of change. The number of seceders would have been largely increased if all Liberal members had dared to obey their convictions. There can be no doubt that the Clubs or Liberal Associations which are now established as permanent institutions have been set in motion by the central managers for the purpose of warning Liberal members of the danger of conscientious scruples. For the time the whole machinery is worked for the benefit of Mr. Gladstone, though he may perhaps himself take no direct part in the interference with the freedom of Parliament. That a majority of 170 should have been reduced to about a third of its full strength is creditable to the Liberal opponents of the Bill and to those who abstained from voting. The House of Lords would be justified in throwing on the Ministers the exclusive responsibility of an iniquitous measure. It is not a little remarkable that a summons to the Conservative peers has been issued with a list of names, headed by the Whig Duke of Somerset, which does not contain the name of a single Conservative leader. There can be little doubt that the Bill will be rejected by an overwhelming majority; but it would seem that Lord Beaconsfield judiciously leaves the conduct of the Opposition to Liberal or independent peers.

BELGIUM.

While France has been celebrating the taking of the Bastille, Belgium has been celebrating its jubilee. Belgium has been an independent and a constitutional kingdom for fifty years, and in these days of change any institution which has lasted for fifty years naturally pauses to ponder on the mystery of its existence, and invites an admiring world to take notice that it has endured so long and still endures. No one who is thus invited to turn his eyes to Belgium and obeys the invitation can deny that Belgium is a most thriving little country, carrying on its affairs in a way creditable to itself and satisfactory to its neighbours, and marked by conspicuous signs of content, energy, and comfort. It has, too, everything a constitutional country ought to have. It has an excellent and popular sovereign, who in any rank of life would be noted for his varied information, his unaffected interest in all the larger social questions of the day, and his frankness and courtesy in the interchange of ideas and knowledge. The alliances of his House with the Bourbons and the Hapsburgs give him an eminence above his rank in the list of European sovereigns, and the memory of his father still survives to invest him with something of the respect long paid to a monarch of singular sagacity and almost unrivalled experience. There is a Senate which, although elected, has some kind of dignity, and which, if it does little else, at least escapes criticism. There is a Chamber, which is the arena of constant Parliamentary fights, carried on in the most approved Parliamentary manner, and in which every vote is of importance, as government is carried on with the smallest conceivable majority. The population steadily increases, and now probably does not fall below five and a half millions. It is a familiar fact that Belgium is more densely populated than any European country; and, if it is a source of happiness that a dense population should be largely composed of landowners, Belgium possesses this advantage in a very remarkable degree. The whole number of proprietors, or, as it would probably be more accurate to say, of properties, is given at more than 1,300,000. Thus, speaking roughly, the number of properties is to the population as one to four, while in France it is one to six, and in the Belgian province of Luxemburg it is said that the proportion of properties to population reaches the astonishing figure of 48 per cent. The revenue—which balances, or perhaps falls slightly short of, the expenditure—amounts to 11 millions sterling a year, and may thus be taken at 2*l.* per head. It appears, if the statistics of different countries are examined, that countries which can just scrape along, like Portugal and Greece, pay about 1*l.* a head; and the nearer a country gets to 2*l.* a head the nearer it approaches to the standard of acknowledged prosperity. Belgium, too, has an army which might contribute to the maintenance of its neutrality in times of danger, but which is not at all disproportioned to its resources, as it consists, or is intended to consist, of 40,000 men in peace and 100,000 in war. It may be added that, if Belgium is not the only country where the State owns some of the chief railways, it is the only country where the ownership of railways has proved a source of great and abiding profit to the State. It is fortunate, too, in having large and rich coalfields in proximity to populous towns, and there is perhaps no country in Europe which in this respect so nearly rivals England.

There can be no doubt that in a large degree it is to its material prosperity that Belgium owes its continuance for fifty years as a constitutional kingdom. Material prosperity always contributes to the continuance of any Government that is established. A prosperous despotism or a prosperous Republic is much more likely to last than a despotism or Republic that is poor or struggling. And it must be remembered that constitutionalism has not so much created as inherited the wealth of Belgium. All the dense population, all the rich soil, all the industrial enterprise of Belgium did not spring into existence when the first Leopold was made king. Belgium was rich centuries ago, while England was still poor. Any Government that starts in a country like Belgium starts with enormous advantages. It must not dry up the sources of prosperity; but, if it avoids this, it is sure to have prosperity on its side. But while the infant constitutionalism of Belgium had this inherited prosperity working in its favour, it had two obstacles in its path, either of which, as experience has shown, might easily have been fatal to any constitutional Government. In the first place, Belgium is inhabited by two distinct populations, and these populations are not only of different origin, but are cut off from each other by the use of two distinct languages. There are a little less than two and a half millions of the population who speak French, and a little more than two and a half millions who speak Flemish, and out of all these millions there are only 340,000 who speak both Flemish and French. Theoretically, it might have been anticipated that the difficulty of welding two halves of a population thus divided into a country of free government would have been almost insuperable. Practically, whatever the difficulty may have been, the Belgians have surmounted it. The other obstacle to constitutional government in Belgium was even more serious. Nowhere is the great contest between the clerical and the anti-clerical parties waged with more bitterness, and nowhere do the opposing parties meet on such equal terms. There is always a clerical Ministry which its adversaries are just not able to overthrow, or an anti-clerical Ministry which would be very glad if the number of its majority equalled the number of our Scotch Conservative members. In Belgium, too, religious differences are a very serious matter. They colour every relation of private life and impair the peace and happiness of innumerable homes. If we can conceive ourselves going on for a dozen years with alternate periods in which there was a majority of three in favour of disestablishment and then a majority of two in favour of establishment, we may picture to our minds how hard it would be to carry on the Government at all. It must be allowed that constitutional Belgium, which has two such difficulties to encounter, not now and then but permanently, and which has for fifty years managed to encounter them successfully, deserves the praise of the friends of free government, and is amply entitled to enjoy its Jubilee, and ask others to share the satisfaction which it feels, and which it exhibits in a modest and rational way.

If it is asked how Belgium has overcome these difficulties, it is only due to the Belgians to give as the first answer that the Belgians are the Belgians, and that men of sense and good spirit can live together under conditions which would break up a society in which a different temper prevailed. Belgium has not only been fortunate in its sovereigns. It has also been fortunate in its statesmen, and in the possession of a large number of shrewd, orderly, sensible men of every rank. But it is to be feared that not all the monarchs and statesmen and sensible individuals of whom it can boast could have saved Belgian

constitutionalism from a catastrophe long before this, had it not been for another advantage of which Belgium reaps the benefit. This advantage is, that Belgium is a little State. It has a somewhat artificial existence dependent on the guarantee and good opinion of the Great Powers, and especially of England. A little State which is in this position is on its good behaviour, and the easiest mode of doing what it is required to do is to stick to constitutional Government when it has got it. The Belgians are very much helped in overcoming their difficulties by the consciousness that if they did not overcome them there would be no Belgium with difficulties to overcome. A despotism or a Republic in Belgium would have many enemies in Europe, while a constitutional Government has nothing but friends. These friends may sometimes be rather lukewarm, but they cannot find in a constitutional Government anything on which to fasten as an excuse for open alienation. If we are to accept the taking of the Bastille as the true beginning of the French Republic, we may certainly select the Revolution of July as the beginning of constitutionalism on the Continent. It led to the independence of Belgium as a small constitutional State, and to the possibility of Lord PALMERSTON pursuing for years his special policy of introducing as much constitutionalism as he saw his way to infuse into every country at which he could get at conveniently. Little by little all the small States of Europe have become constitutional, with the exception of Switzerland, where an ancient and respected Republic rendered any change unnecessary. France tried constitutionalism and rejected it; and one main reason why it rejected it was that, being a great country, it felt itself as free to reject it as it had been to accept it. France is what France chooses to be. It takes the consequences of its choice, and without hesitation meets the world as a Republic or an Empire, or again as a Republic. But little States which to exist at all must avoid giving offence desire to be at once happy and unnoticed, and they have discovered that, if constitutionalism adds to their own happiness, it also has the excellent secondary effect of enabling them to escape the kind of notice that would be unpleasant to them. They thus enjoy all the good fortune that proverbially attaches to nations that have no history, and of this species of good fortune the Belgian Jubilee has been a very successful commemoration.

THE INDIAN FAMINE COMMISSION.

THE Report of the Indian Famine Commission loses something in interest by the fact that it is as yet incomplete. The questions into which the Commissioners were instructed to inquire were mainly two—the measures to be adopted when famine has actually arrived, and the expedients by which it is possible to make famines less severe or less frequent than they at present are. As yet we are only in possession of the first part of the Commissioners' Report—that which deals with the measures to be adopted in the actual presence of famine. It is evident, however, that our acceptance of their conclusions under this head may be greatly modified by the second part of their Report. If it should appear that the Commissioners have underrated the power of the State to avert famine, it will naturally follow that they have overrated the necessity for relieving famine. The conception of the State as a power protecting its subjects against starvation renders the conception of the State as a power relieving its subjects when starving superfluous. It is quite certain, of course, that the former function will never be so perfectly discharged as to leave no room for the latter. But it is difficult to give an opinion upon recommendations directed to the organization of State relief until something is known of the extent to which other measures may be expected to make relief unnecessary.

Taking this first part of the Report as complete in itself, it presents a useful survey of the several famines which have happened in India during the last century, and of the means adopted to deal with them. The last part is necessarily the shorter of the two. It was not until the famine in Orissa in 1866 that the Government admitted their obligation to prevent the people from starving; but the very fact that they were almost powerless to apply their doctrine in the actual circumstances of the province brought the question prominently before the public, greatly influenced the action of the officials seven years later. In 1873-4 the winter rice crop failed in Northern Bengal, and, in view of the scarcity which was expected to follow, the Government acted with extraordinary energy. The Estimates included an importation of 480,000 tons of rice, and "provided against every possible contingency." When the famine was over, it appeared that no lives had been lost, and even that 100,000 tons of rice remained unused. The number of persons in need of relief had been designedly exaggerated in order that an ample margin of unexpended relief might be secured. This result, however, was obtained at a cost to the State of 6½ millions sterling. Three years later Southern India was visited by a yet worse calamity. The Government of India had been startled by the cost of famine relief in 1873-4, and had, as it thought, learnt from experience that it was possible to take too many precautions. During the Bengal famine the aim had been simply to save life; and every official knew that, provided this were done, the Government would not be extreme to count the money spent in doing it. During the famine in Southern India the aim was also to save life; but even in the statement of that aim there was a recognition that it might be beyond the power of the authorities to attain it. The Government, it was said, would spare no effort to save the population of the distressed districts from starvation, but they would not attempt to prevent suffering or to give general relief. Limitations of this kind naturally affect the action of the officials in doubtful cases. They know that the cost of saving life will be considered, and they consequently seek to reduce that cost to the lowest possible figure. There is no question of maximum estimates or of a margin of unused grain; the object is to calculate with the utmost nicety what will be wanted, and to have nothing left over when the wants come to an end. Notwithstanding these precautions, the cost of the relief operations in Southern India was eight millions; but, though it thus exceeded by a million and a half the cost of the Bengal famine, the result was far less satisfactory. Five millions of people died either from insufficient food or from the diseases commonly associated with insufficient food. In so far as this difference of result was owing to the difference in the measures adopted, the lavish method has an undoubted advantage over the parsimonious method. It may not be prudent for the State to attempt to prevent loss of life by famine; but if it does attempt it, it is well to make sure of success. It may admit of argument that the State might do more good to the people of India by refraining from imposing additional taxes than it can do by keeping the inhabitants of any particular province alive when they have outgrown their ordinary means of subsistence. But when once the State has presented itself to the people in the light of a special and over-ruling providence, it is important that it should proclaim itself to be an omnipotent providence. We do not know whether the Government gained anything in the opinion of its Indian subjects by the completeness with which it shielded them from the calamity of 1873-4; but it seems highly probable that it has lost something by its omission to shield them from the similar calamity of 1876-8. The five millions who died through the apathy or miscalculation or economy of the Indian Government are likely to have a more lasting place in Indian memories than the numbers—necessarily unknown—who were saved in 1873-4.

It does not appear from the Report what were the precise causes which led to the failure of the campaign against famine in Southern India as compared with the similar struggle three years earlier in Bengal. In theory, it seems, the principles upon which the Government had acted in the earlier instance were adopted in the later. In practice, however, "important modifications arose from the adoption "of the policy of leaving the supply of grain to the ordinary "operations of trade, and from the greater anxiety shown "to avoid profusion of expenditure and to secure the useful "application of labour." Unfortunately opinion differs as to the share which this change of view had in killing off five millions of people. It may be, of course, that the conditions of the famine in Madras and Bombay were so unlike those of the famine in Bengal that even an equally lavish expenditure would not have ensured the same immunity from death. But there is, at all events, a presumption in favour of the plan which has had no cases of starvation laid at its door over the plan which has not escaped such charges.

The regularity with which famines are now known to recur in various parts of India makes it incumbent upon the Government to have a perfectly understood code of regulations ready for application when the necessity arises. So long as each separate famine was supposed to be a calamity by itself, and not one that was certain to be followed by another, there was some excuse for the authorities if they were taken unawares. But with famines to be expected at average intervals of eleven or twelve years, and less severe scarcity two years out of every nine, there is no excuse for want of preparation. The Commissioners recommend that the Government of India should issue a set of rules embodying the main principles on which famine relief is to be administered, and that the local Governments should draw up famine codes applying these principles to the particular circumstances of each province. A draft of these rules and a model famine code has been drawn up by the Commissioners, and some points that are now obscure in their Report—especially the merits of the controversy which has arisen between Mr. CAIRD and Mr. SULLIVAN on the one side, and the remaining Commissioners on the other, upon the mode of providing relief—will probably become clear when this code is published. The Commissioners may justly be praised for the very thorough manner in which their work has hitherto been done, and their Report, when finished, will be a storehouse of information upon one of the most important and difficult subjects with which a Government can have to deal.

THE CHILTERN HUNDREDS.

SIR DRUMMOND WOLFF and his friends were quite entitled to bring to the notice of the House of Commons the many curious questions of Parliamentary law to which the peculiar position of Mr. DODSON gave rise. They were questions of a kind to which the attention of the House has been repeatedly called; and the whole system of Parliamentary procedure is at once so intricate and so exceptional that members who are acquainted with it, and can appreciate the importance of any variation in it, are fulfilling a public duty in taking cognizance of any novelty that may be introduced. In the case of Mr. DODSON two distinct questions were raised. He was elected for Chester at the general election, and a petition was presented against his return. Before the petition was heard he accepted office. A new writ was issued, and he was re-elected without a contest. All this was quite regular. The petitioners did not claim the seat. Had they done so, no new writ could have been issued. This was settled in the Athlone case, when the seat was claimed against Mr. KEOGH, the sitting member, and on his accepting the office of Solicitor-General for Ireland, the issue of a new writ was delayed until the petition had been heard and determined. That a new writ might issue if the seat was not claimed was decided by the SPEAKER in 1852; and, although the decision was subsequently criticized in Lord BURY'S case, it has been practically adopted by the House as part of its standing procedure. Lord BURY'S case, however, illustrated what may be termed the theoretical objections to the rule. Lord BURY was elected, a petition was presented, he accepted office, and was re-elected. But another petition was presented against his second return, and he was unseated. The reason why a candidate who has been guilty of bribery or corrupt practices through his agents is not allowed to represent the same constituency in the same Parliament must be that it is apprehended that he has got into bad hands, and that he and they cannot be trusted to work together innocently until a considerable interval of time has elapsed. In the same way, if a defeated candidate petitions, not claiming the seat, succeeds, and then stands, on a new writ being issued, for the same constituency, all his acts and those of his agents in the first contest may be brought up to throw light on their conduct in the second election, supposing he is elected and is petitioned against. What Parliament objects to is that a candidate should be in a position to repeat or to profit by the improper practices of his agents at a former election. The case of Lord BURY showed that such a thing might happen; and, if nothing was to be considered but the expediency of interposing the severest checks possible in the way of corrupt practices, it might be held that no new writ should issue until a petition, whether claiming the seat or not, had been disposed of. It has been decided that the Chiltern Hundreds shall not be given to a member against whom a petition has been presented before it has been determined. But in the case of Ministers it has been thought to be inexpedient that they should be kept, possibly for months, out of Parliament, and as it would be easy to keep them out by presenting a petition for the mere purpose of excluding them for a term from the discharge of their Parliamentary duties, the custom has prevailed, entirely on the ground of convenience, of letting them at once have the benefit of the issue of a new writ.

When, as in the case of Mr. DODSON, a member has been elected, a petition has been presented, he has accepted office and has been re-elected, and then the petition has been decided against him, the ordinary course would be to issue a new writ. He has been rendered incapable of being elected or sitting for the same constituency. The House takes cognizance of this, and orders a new writ, and he is then capable of being elected for any other constituency, as he has plainly ceased to be a member of Parliament, and no disqualification attaches to him except that of being unable to sit for the same seat from which he has been ejected. But at Chester the judges have reported that corrupt practices extensively prevailed, and under such circumstances no new writ is allowed to be issued. Mr. DODSON could not get absolutely quit of Chester. By what tie he could be supposed to be still bound to Chester it is most difficult to see. He could not be taken to represent Chester; for he was clearly, under an Act of Parliament, a person incapable of being elected or sitting for Chester, and he would undoubtedly have been liable to a penalty if, after the decision of the election Judges, he had sat and voted in Parliament. All that can be said is that the usual step in formally terminating the connexion between the constituency and the member had not been taken. No new writ had been issued, and the House had therefore not taken formal cognizance of the fact that Mr. DODSON had ceased to be member for Chester. In order to remove the least shadow of a doubt as to his position, Mr. DODSON accepted the Chiltern Hundreds, or, to speak more accurately, the Stewardship of the Manor of Northstead. This is a place of profit under the Crown, and by statute the acceptance of such a place vacates the seat. Here it is not that the member is ineligible, but that his seat is vacated. He is in the position in which Mr. DODSON would have been if the Elections Act, after declaring a member against whom a petition had been successfully presented incapable of being elected or sitting for the same constituency, had gone on to say that his seat was vacated. Nothing can be more technical and subtle than the distinction; but, in order to avoid the merest shadow of a possibility that Mr. DODSON'S position, if elected for another constituency, might be questioned, the Government thought it advisable that he should go through the form of accepting a trifling but disqualifying office under the Crown.

But this raised a further question. Mr. DODSON held one office under the Crown and then accepted another, and his seat was thus held to be vacated. This second office was the Stewardship of the Crown Manor of Northstead, and the granting of this Stewardship is a proceeding venerable from antiquity and of recognized convenience, but in itself of a very curious nature. The grant is made, not by the Crown direct, but by the Chancellor of the Exchequer, who theoretically appoints one of his own subordinate officers. This officer is commissioned to be Steward and Bailiff of the Manor, and to have all wages, fees, and allowances pertaining to the office during the pleasure of the Sovereign. It is these words in the grant that are held to carry with them the consequences of the seat being vacated. These possible fees and allowances are a profit, and being held during the Sovereign's pleasure are a profit under the Crown. If a member holding one office of profit under the Crown is re-elected, and then accepts another such office, his seat is vacated, and he has to be re-elected, in order to be a member of Parliament. Mr. DODSON, if he gets in for Scarborough or anywhere else, will have obliterated his acceptance of the Stewardship of Northstead. But in 1873 Mr. GLADSTONE, holding one office of profit under the Crown, that of First Lord of the Treasury, accepted another, that of

Chancellor of the Exchequer; and in accordance with precedent added half the salary of the Chancellor to the full salary of First Lord. Why was his seat for Greenwich not vacated by his acceptance of this second office of profit? Mr. GLADSTONE did not think himself bound to act as if his seat had been vacated. He did not seek re-election from his constituents. He seems to have persuaded himself that, under the Act of 1867, certain specified offices, among which was the Chancellorship of the Exchequer, were allowed to be held in conjunction with other offices of profit. The Stewardship of the Manor of Northstead was not one of those specified offices, and therefore he drew a distinction between his case and that of Mr. DODSON. He owned that his interpretation of the Act of 1867 was open to serious question, and that it would, and even ought to, have been questioned had it not been for the dissolution of 1874, which shelved that and so many other questions of more importance. It is, however, inconvenient that such a question should remain undecided, and there are many objections which Mr. GLADSTONE stated he recently felt to the system by which the only mode in which a member can terminate his connexion with an existing Parliament is the acceptance of an illusory office which it rests in the absolute discretion of one Minister to grant or refuse. It is not surprising, therefore, that Sir DRUMMOND WOLFF announced his intention of calling the attention of the House next Session to the general subject of the mode in which seats are or ought to be vacated.

M. ROCHEFORT AND THE OPPORTUNISTS.

M. ROCHEFORT has taken the earliest occasion of proving that his relations with M. GAMBETTA are not to be complicated by any intrusion of foolish gratitude for the share M. GAMBETTA has had in bringing the Communists back to France. With M. ROCHEFORT principles come before persons. His hatred of Opportunism and all its works is in no way diminished by the fact that the leader of the Opportunists has incidentally done him a good turn. It is only fair to M. ROCHEFORT to admit that he has not been more insensible to M. GAMBETTA'S kindness than he had every right to be. M. GAMBETTA had, no doubt, very sufficient reasons, from his own point of view, for pressing on the amnesty; but a disinterested affection for M. ROCHEFORT was certainly not one of them. He has allowed M. ROCHEFORT to exchange Geneva for Paris because on the whole he wished to have him at home rather than abroad. But there is no reason why M. ROCHEFORT should love M. GAMBETTA any the better for doing what he himself likes, and M. ROCHEFORT is not the kind of man to accept M. GAMBETTA'S services without consideration of the motives which have led him to render them. In restoring M. ROCHEFORT to a country which in its heart would have been very well content to do without him, M. GAMBETTA restored and knew that he restored an enemy who meant to injure him whenever he could.

M. ROCHEFORT'S line is evidently not oratory. His speech last Sunday at a Democratic banquet was read, like an Anglican sermon, and no doubt suffered all the disadvantages which belong to that method of delivery. It may have been a worse fault in the eyes of his admirers that in printing his speech in his newspaper the *Intransigeant*, he showed a kind of prudence hardly distinguishable from Opportunism. According to the report given in some other papers, he was interrupted while recalling the names of some of the Communist leaders by a remark that one of them, MILLIÈRE, had been assassinated. Upon which M. ROCHEFORT replied, "Yes! he has "been assassinated, and we will avenge him." Probably the proprietor of the *Intransigeant* felt that to print this in his own paper, as coming from himself, might prove inconvenient, and accordingly it does not appear. But how will those who heard it said take its omission from what purports to be the official report of what took place? It may be accepted as prudence, but then it may also be mistaken for want of courage, and that is the last defect that can be tolerated in a revolutionary leader. This is not the only evidence M. ROCHEFORT has already given of a disposition to over-caution. No mention is made in the *Intransigeant* of a speech delivered by M. LANESSAN, a member of the Municipal Council of Paris, which contained some very heroic things. "You must have," M. LANESSAN said, "not voting papers only, but chassepôts."; and when some advocate of moral force objected that chassepôts would not be needed, he put to him this pertinent question—"Then how will you defend yourselves against GAMBETTA when he assails you with "his votes and his GALLIFETS?" This ingenious and appropriate reference to the conversion to Republican opinions which the principal military hero in the suppression of the Commune has since undergone was checked by M. ROCHEFORT, and no reference to it appears in the *Intransigeant*. Of course this may be accepted as evidence of M. ROCHEFORT'S desire to reserve himself for the greater enterprises which are in store for him. But the Communists of Paris may in time grow weary of these continual restraints, and desire to see their leader risk himself a little. It is just this which M. ROCHEFORT appears unwilling to do. He plainly wishes to keep out of prison. This is not in itself a reprehensible desire, even in a returned Communist; but it is one that M. ROCHEFORT'S rivals—and we may be sure that he already has rivals—may turn to a good deal of account. M. LANESSAN, for example, may justly feel proud that he has dared to say what M. ROCHEFORT was afraid either to listen to or to print, and he may find others as ready as himself to admire his superior boldness.

The matter of M. ROCHEFORT'S address was very much to the purpose. The Opportunist measures are not without their weaknesses when viewed from the heights of a more thoroughgoing policy, and M. ROCHEFORT described these failings in a way which was very well calculated to bring them home to his hearers. Instead of separating Church and State by the complete suppression of the Budget of Public Worship, the Government have turned certain members of one religious order out of their houses, and are now so frightened at the opportunity thus given to the Jesuits of playing the martyr, that they have determined to leave the other orders alone. It is only, however, when they are dealing with public interests that the Opportunists lag behind. Where their own interests are concerned M. ROCHEFORT sees them animated by a feverish activity. Their real programme is summed up in the exhortation given to their friends in every possible shape—"Get "rich." Their business is to distribute places and dividends among themselves. They are ready to forego a *coup d'état* provided that they can count upon effecting a *coup de Bourse*. This, according to M. ROCHEFORT, is the real distinction between the Opportunists and the Socialist Republicans. The one is the party of the rich, the other is the party of the poor. The Opportunists have money and the command of the administration. The Socialist Republicans have only union, and that sense of numerical strength which the poor can never be without. But, though the Socialist Republic is the Republic of the poor as opposed to the well-to-do, it does not reject the service of the well-to-do. The history of the Commune showed that men who by birth belonged to the *bourgeoisie* could be as devoted to the interests of the proletariat as if they had been born workmen. Social distinctions count for nothing among men who march under the same banner against the same enemy.

It would be difficult to frame an address better fitted to take the fancy, and in a sense to promote the interest, of those to whom it was addressed. The distinction between rich and poor is more permanent than any distinction founded on forms of government, and it is one which the establishment of the Republic has brought home to the populations of the great cities. The workmen of Paris now live under a Government which, on the whole, is what they have desired. They would like, it is true, to get rid of the Senate; but, with that exception, they cannot quarrel with the mould in which the State is cast. They have a Legislature elected by universal suffrage, and a President elected by the Legislature. The old grievance that France is a Republic without Republicans no longer exists. The politicians who, by choice or by antecedents, were associated with the Governments that have preceded the Republic are now, with rare exceptions, banished from the service of the State. No names are any longer met with which, in the persons either of their present or their former owners, are associated with any of the past glories of France. Legitimists, Orleanists, Imperialists, and even Moderate Republicans, are alike proscribed. Yet, with all this, the workmen of Paris find their condition no better than it was before the Republic was set up. The benefits they
